OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

If among the more than 40,000 Cultivator's weekly circulation any fail to find any article they desire to purchase advertised in the Cultivator's columns, a special request is extended to you to let your wants be known to the California Cultivator and we will place you in touch with proper parties.

EDITORIALETTES

The cover illustration this week is good "reading" at this time of the year when one spends a portion of an occasional long evening in mentally taking a mid-summer trip. The whole Sacramento Valley abounds in wonderful drives and roadways through miles of these great valley oaks.

The alfalfa weevil has not so far as we know found location in California's alfalfa fields. It has crossed the boundary line but quarantine officials have succeeded in capturing these first comers which might prove permanent stayers if released in alfalfa sections instead of the specimen cases of the state department of agriculture. One such possible beginning of a colony was picked up by Inspector French of the department, located at San Diego. The work of Mr. French has to do with many carloads of ponies and feed for them. These are passing through San Diego on the way to Tia Juana. One such shipment developed an infestation in the bedding used for the ponies. Other officials have found the weevil in carloads of potatoes, and as all kinds of hay and straw are used

in the packing of many products in the state, it seems that eternal vigilance on the part of the state officials is necessary to protect us.

It is time for us all to be looking over the 1920 account book and becoming familiar with the income and the expenses of the year. Congress has given us a little larger exemption and the burden is lifted slightly, but thorough familiarity with the present law and with our own affairs will aid us in rendering entire justice to the government and securing for ourselves just proportion in government maintenance.

President Gustafson of the U. S. Grain Growers is insisting upon investigation of the export grain trade by the federal trade commission in order to determine reasons for present ruinous prices. This investigation is called for in senate resolution No. 133. Both producers and consumers may safely urge our congressmen to pass this resolution, and if it is car-

trenched private interests from the day it was first offered the public. All the endorsements so far procured were obtained in the face of this hostility. Similarly, the campaign to procure initiative signatures was opposed and obstructed in every possible way—with the same result. The act is on the ballot, and it was placed there with a large surplus of signatures.

"While clearly recognizing legitimate grounds for differences of opinion on any public issue, it is a simple statement of fact the opposition to this measure has been led by the special privilege interests and those who have consistently and unfailingly opposed every progressive measure which has ever been advanced in California. Hence, the alignment is clear. The issue lies between the unrelenting enemies of California's entire program of progressive legislation of the last 11 years—you will find them all on record against this measure—and those who fought successfully to place California in the forefront of the enlightened commonwealths of the world.

"The battle goes on. California must make good its gains by meeting and solving this great economic problem. It has no coal, its oil supply cannot long care for its needs, millions of potentially fertile acres are

we should ask if their trouble is not ours, and see what can be done to improve the situation. Purely from self interest, if for no higher motive, we should help them. All of us want to get back permanently to 'normalcy'; but is it reasonable to hope for that condition unless our greatest and most basic industry can be put on a sound and solid permanent foundation? The farmers are not entitled to special privileges; but are they not right in demanding that they be placed on an equal footing with the buyers of their products and with other industries?"

In addition Mr. Baruch in a personal letter says:

"It is my belief that the farmers enjoy the sympathy of large numbers of persons who, like myself, are not directly associated with them in an economic sense. In other words, these persons perceive that the problems of agricultural merchandising, financing and distribution are not merely class but, rather, common problems."

In other words, the capitalists of industry have arrived at a point where they are willing to join with the farmer in correcting the present situation instead of sympathizing and preaching up to it. But so long as the present attitude of protecting large aggregations of capital invested in industries and in transportation prevails, and it is insisted that the cost of such protection shall be borne by the farmer, there will be nothing gained by discussion. When the farmer with small capital invested has an equal show with the manufacturer with large capital we believe it will be found there is but a short step back to normalcy.

BUILD MORE HOMES

And now we are going to save the destructive forces of the Colorado river and turn them into home comforts and home conveniences. This will benefit seven states of the Southwest. At the same time Dr. Mead of the University of California is working for a vast cultivation project which will call for the expenditure of \$3,000,000 and the utilization of many thousand, possibly a million, acres of the lands of the Sacramento Valley. Dr. Mead has said:

"At present, outside of the state land settlements, we are drifting. The solvency of irrigation companies is menaced. The office of the state land settlement division has become a clearing house for the people who have new schemes for selling land. They realize that the old plans no longer appeal.

"Last week I attended a conference in the San Joaquin Valley, called by people who wished to protect unwary or oversanguine land buyers from Eastern states. They are brought here by Eastern agents, taken through our best vineyards and orange groves, told fairy tales of profits and are then asked to sign on the dotted line. The farm bureaus meet these settlers when it is too late. They find them planting Emperor grapes in soil that will grow nothing but experience, and almond trees where the only result will be root knot. All present at that meeting had made a study of the Delhi state settlement. They want its methods adopted in 20 settlements instead of two.

"Nearly every state west of the Mississippi is working on a land settlement policy. Washington has asked the loan of the superintendent of the Durham state settlement to bring its land settlement act in operation.

"We have come to a time when more money must be secured than can be obtained from the state. New plans must be evolved in which there would be cooperation between land owners, land banks and the state. We must use government agencies to obtain money, because only in that way can we get the interest rate down to what land buying will stand. I do not believe that the farm buyer can pay more than five per cent.

"Senator Breed has succeeded in securing from the legislature approval of a bond issue of \$3,000,000 to be used to finance future settlements. If these bonds are voted it gives money with which to carry on. If the bond issue fails, I do not believe another direct appropriation can be secured. It will mean an end of the policies that created Durham and Delhi."

We appreciate and take this means of thanking the writers of many complimentary letters from the Cultivator's big family of subscribers, in reference to the efforts of the publisher in furnishing quality articles the past year, that really helped solve agricultural and livestock problems. These boosts encourage us to greater efforts this year. Our subscribers can assist us in making the paper better by buying whenever possible from advertisers using the columns of the Cultivator to carry weekly messages to California homes. Delay in buying necessities which make life worth living and the farm more profitable means just so much time and opportunity lost. Lost time never returns. If interested in any appliance, implement, power plant, auto equipment, feed or animal, correspond with the advertiser. It may be the means of bringing you something really profitable.—Business Office.

ried congress may secure information which will help us to determine why there is such an enormous spread between producer's return and consumer's cost. One trouble with wheat is that supply and demand has not made the price. It has been named by a bunch of conscienceless gamblers through a system which congress persists in tolerating.

The state railroad commission refers to the recent 10 per cent cut in freight rates as a "record cut" on the chief farm products of California. This may be a record cut but it looks to the producer as a desperately small cut as compared with the 33 per cent advance made some two or three years ago which resulted in taking the bread and butter from many a farmer's mouth.

WATER AND POWER ACT

More than 60,000 signatures to the initiative petition to place California's water and power act on the ballot have been certified, with still many more to be recorded. This assures without question the opportunity to vote at the next general election on an amendment to the constitution which will enable the people of California to take advantage of their own resources.

This measure would make state credit available for the development of water and power by communities or associations at cost. The revenues brought in by the plants would be sufficient to carry overhead and pay out the bonds. This is the measure which was so heartily, in fact, unanimously endorsed at the last meeting of the California League of Municipalities. The state campaign committee which will conduct a campaign of education makes the following statement:

"California's water and power act has been bitterly opposed by in-

suffering for lack of water for irrigation. The water and the power are here and they are ours. Private operation has proven inadequate to the demands of California's growth. The people of California must do the job themselves. California's water and power act offers the one sound, practicable way to do it.

"This measure was drawn by specialists and experts in the problems involved. It represents nearly three months' work by legislators, financiers, economists, engineers, attorneys, agriculturists, business men and others who brought years of practical experience to the task."

RELIEF FOR FARMERS

The president has requested the secretary of agriculture to call a conference of the thinkers of the land to determine as to what legislative or other steps should be taken to secure relief for the farmers. It is probable that this discussion has been advanced because of a desire to stabilize the country's greatest industry. Notwithstanding that, it is also probable that the farmer's bloc in congress has taken such a stand that it was seen he was getting in a condition to fight his own battle. However, there is a very fair tone in much of the discussion resulting from the present situation. For instance, in an article appearing in a recent Atlantic Monthly Bernard M. Baruch suggests:

"Agriculture is the greatest and fundamentally the most important of our American industries. The cities are but the branches of the tree of national life, the roots of which go deeply into the land. We all flourish or decline with the farmer. So, when we of the cities read of the present universal distress of the farmers, of a slump of six billion dollars in the farm value of their crops in a single year, of their inability to meet mortgages or to pay current bills, and how, seeking relief from their ills, they are planning to form pools, inaugurate farmers' strikes, and demand legislation abolishing grain exchanges, private cattle markets, and the like, we ought not hastily to brand them as economic heretics and highwaymen, and hurl at them the charge of being seekers of special privilege. Rather,

One Dollar Yearly

Planting a Walnut Orchard

By J. B. Neff

630.5
CA
V. 58

BEFORE walnut trees are planted a careful selection of soil and location should be made, as a walnut orchard in a proper location, properly planted with carefully selected trees, will be a source of pleasure and profit to the owners much longer than the usual life of men, while injudicious planting and selection will always be a source of annoyance and regret.

Don'ts

A few of the "don'ts" may well be noted in the beginning. Don't plant on alkali land. The walnut is as susceptible to injury from alkali as the orange tree. Don't plant on low ground which is subject to late frosts in the spring and early frosts in the fall. This means that it is unsafe to plant on the low part of a valley that does not have good air drainage to a still lower part of the valley. The very young growth of a walnut tree will not endure more frost than a tomato plant. This will cause the loss of the crop for that year and an early frost that kills the leaves in the fall means undeveloped wood which dies back and shortens the crop for the next year. Don't plant on hardpan, even if it is 10 feet from the surface, as it may prevent water drainage and kill trees. Don't plant where the free water in the soil may stand near the surface at times. This means that the trees may be completely killed some wet winter. The roots will not live in standing water but will accommodate themselves to an unvarying water table and do well where the water is not more than four feet below the surface. This, however, is not safe and should be avoided.

Number per Acre

Don't plant too many trees on an

acre. Sixty feet apart in squares is close enough. If conditions are good the tree will need all the space and if conditions are poor so much more reason for giving the tree the use of more soil. Tree roots extend much farther from the trunk, near the surface, than is commonly supposed and likewise they do not fill the soil to the generally supposed depth. One may be sure the lateral roots reach much farther in all directions than the trunk reaches upward, while not more than five to ten per cent of the roots will be below three feet from the surface in the best loamy soils. The central, or so-called tap root, seldom extends more than six feet below the surface. Don't plant on poor soil or that which may be underlaid by clean sand at three or four feet below the surface. The sand will allow the water to escape downward and carry off soluble fertility, at the same time making it difficult to maintain a proper supply of moisture and fertility. Don't plant on land having two or three feet of good soil, then a layer of clean sand three inches to six inches thick to good soil. The roots cannot penetrate clean sand any better than a layer of cement and will not reach the good soil below.

They Need Plenty of Water

Don't undertake to grow an orchard without a plentiful and permanent water supply. With careful management 25 acre inches of irrigation water will be needed to produce a crop of walnuts when the trees have

been planted 15 to 20 years. This means that a stream of 50 inches must be run 25 hours on each acre during the five months of the irrigating season, that is, five hours during each month, as may be needed. We are often told that certain soils do not require as much water as other soils. This is not altogether correct and it is better to say that some soils do not waste water as rapidly as others. If proper management is given in the application of water and in the methods of conservation of moisture there will be but little difference in the quantity of water needed on the various soils, provided the soils have sufficient depth.

Planting

After having determined that soil conditions, location and water supply are what is needed the selection of trees and planting can be done.

Select the variety best adapted to the locality and plant only thrifty, stocky trees with good root systems and one year old grafts. A well rooted, strong bodied tree seven feet high is better than one with a slender body 10 to 12 feet high. The tree with the slender body will likely have to be cut back to five or six feet while the stocky tree will be ready to start the permanent branches for the bearing tree.

Trees should be planted as soon as possible after being taken from the nursery and in holes large enough to receive the roots without crowding.

The roots should be placed by hand and the soil well firmed around the roots by hand, using the surface soil

in the lower part of the hole and around the roots. Do not put any kind of fertilizer in the holes nor near the roots when planting.

Time of Planting

Plant as early in January as can be done but do not in any case wait until the roots begin to put out their new fibers. Run a stream of water along the rows as soon as the planting is done so as to settle the soil and fill all air spaces. Heading back to 18 inches or two feet is advisable only when trees have been out of the ground a long time and are partially dried or have very tall and slender bodies. Trees which have been headed back will in many cases make longer single stem growths than without heading but are more difficult to keep properly trained and have the disadvantage of being more subject to sunburn and dieback the next winter. If this undeveloped growth dies back once it is extremely difficult to get a properly formed tree. It is not well to let any shoot grow too far ahead of the others. These should be pinched off at a bud pointing in the proper direction for the new branch.

Interplanting

Interplanting can be done to advantage if the interplanted trees are removed early enough but when walnuts are planted with the intention of taking out the owner will find that trees in the permanent rows are often not as good as the interset trees and the temptation to leave all another year cannot be resisted, much to the damage of the orchard and the reduction of the crop. Much better plant peach and apricot trees or depend on growing beans or other annual crops.

Selecting a Market for Hay Shipments

THERE are almost as many methods of selling hay as there are markets, but the principal methods are designated according to the location of the sale. The warehouse method consists of selling the hay at railroad or public warehouses after it has been unloaded from cars. The car door method is employed where hay is sold from track in railroad yards and is made, as the name indicates, at the car door and based upon the quality of the hay as it appears at the doorway of the car. Plug sales are made in special railroad yards from a sample or plug consisting of 20 to 30 bales which have been removed from the car and piled on the ground or on a platform along the tracks and beside the car from which it was taken.

No one method is generally best in all particulars, but the shipper should know which method is used in the market receiving his hay, and also what service is rendered for the charges assessed. It will then be possible to determine which method will result in the largest returns for his particular kind and grade of hay.

If the shipper prefers the consignment method of marketing, it is usu-

ally the best policy to consign only to markets having a broad, general demand sufficient to absorb large quantities of different kinds and grades of hay. While definite sales can frequently be made very advantageously to the smaller markets, the current demand for spot hay is generally so small that a few cars of consigned hay will overstock the market and cause the shippers serious losses. Even in the larger markets the demand is not unlimited, and shippers should inform themselves as to the quantity the various consignment markets can normally handle or consume without seriously depressing prices. Markets which have storage warehouses are likely to be steadier than those which must depend upon daily arrivals to supply the fluctuating demand. It is very difficult always to hit the high prices when consigning hay, and a policy of steady shipments, if consigning is preferred, will probably produce the most satisfactory results for the entire season.

The hay shipper should give particular attention to the size and weight of bales that are preferred in any particular market and cater to that preference when making consigned

shipments. Hay in bales of undesired size or weight is usually discounted from \$1 to \$2 per ton by the buyers. This preference varies in the different markets, and hay which will bring a premium in one market may be severely discounted in another. It is the buyer's preference rather than that of the shipper which prevails.

In general, New England and eastern markets prefer large five wire bales weighing from 175 to 215 pounds. Southeastern, southern and southwestern markets prefer small two or three wire bales weighing from 75 to 100 pounds. These bales range in size from 14 by 16 inches to 17 by 22 inches by about 36 to 48 inches in length. In the central western markets the 17 by 22 inch bale is probably the most generally used, while on the Pacific Coast both this size and the large five wire bale prevail almost exclusively.

Since the weighing and inspection charges are almost always charged in full to the shipper when the hay is consigned, he is directly interested in the weight and inspection methods employed and in the degree of economy with which these functions are administered. The shipper should insist that only accurate weighing methods which will furnish correct weights be used. Official weight certificates showing the number of bales unloaded and the total weight of the hay should be demanded if charges are

made by the market for the weighing service.

In the matter of inspection the shipper is entitled to an official certificate, if official inspection is maintained at a market, which should state the grade designations and the quantity of the hay covered by each designation if more than one grade is assigned to the carload. If a full car is not inspected, the certificate should state just what part was inspected and graded, and the charges based upon the service rendered.

Profitable returns from consignments depend a great deal upon the ability and reliability of the shipper's representative at the market. Only representatives who can or have demonstrated their ability as conscientious and trained salesmen, and who know the needs of the market and the responsibility and financial standing of the buyers should be employed. Such services may entail a higher initial cost, but will probably be more economical in the end.

Where trade organizations or exchanges exist, membership in them, which requires certain desirable qualifications, is to some extent a guarantee of the members' reliability, but there are also many reliable men outside of such organizations who will render efficient service. Shippers, however, should obtain bank and other commercial reports concerning commission merchants to whom they expect to intrust the marketing of their hay before making shipments.

Agricultural News Notes of the Pacific Coast

Northern California

January 2-6 has been veterinarians week at the university farm at Davis.

Glenn County farm bureau increased its membership 100 per cent last month.

The North of Bay Counties Association begins publication of a magazine, January 1.

The farm center at Anderson, Shasta County, has formed an irrigation department.

A hog auction will be held January 10 by the Tehama County farm bureau at Red Bluff.

The Orland farm bureau is discussing the advisability of locating a cannery at Orland.

The Glenn County farm bureau is planning a two day clean up campaign of farms, gardens and lawns.

The Capay farm center at its recent annual meeting elected W. E. Hill president; J. W. Rich, secretary.

Preparations are going forward for establishing the packing plant of the Prune & Apricot Growers at Colusa.

The Rosenberg mill at Colusa has closed down, having finished on 1920 rice crop. Work will soon begin on 1921 rice.

An irrigation district has been formed west of Williams, Colusa County. It will purchase its water from the Glenn-Colusa district.

The alien land law forbidding aliens non-eligible to citizenship to own or lease agricultural land in California has been upheld by federal court.

The Petaluma County cow testing association tested 1350 cows during its last year's activities. Average production butterfat 248 pounds; last year, 223.8 pounds.

Another concerted blow in the fight for lower freight rates was struck by a meeting at Lodi this week of the California Growers & Shippers Protective League with the Lodi league.

The California farm bureau exchange has headquarters at 354 Pine St., San Francisco. It has now established grain sales, live stock, and poultry and purchasing departments.

L. M. Jeffers has been appointed chief grain and warehouse inspector of the bureau of standardization, acting both for the state department of agriculture and the federal government.

Cow testers of associations in Sonoma County are collecting data on costs of production. This is being done under supervision of Prof. R. L. Adams of the state university. Similar work will be done all over the state.

A scale of wages for ranch workers in Tehama County has been announced as the result of a meeting of farmers at Red Bluff. The new scale calls for \$1.50 a day and board for long line drivers of horses, \$1.25 a day and board for two horse drivers and general farm hands, and \$4.50 a day and board for tractor drivers.

A new fruit marketing association has been formed, comprising the New-castle Fruit Company, Placer County Mountain Fruit Company, Silva-Bergthold Company, Vacaville Fruit Company, and Penrhyn Fruit Company. Its officers are H. E. Butler, president; J. E. Bergthold, vice president; W. R. Monahan, treasurer; W. J. Charlesworth, secretary-manager.

Central California

Bakersfield complains that it is overrun by peddlers.

Clovis, Fresno County, is suffering from chicken thieves.

Heavy losses for potato growers of the Delta section are reported.

Practically all the navel orange crop of the Lindsay section of Tulare County has been sold.

An advance of a half cent per pound has been made in prune prices by the association.

Marina, Monterey County, has organized a farm center. Meetings will be held on the first Monday of each month.

A shipment of Watsonville Newtowns has just been made from San Francisco to Batavia in the Dutch East Indies.

Over 10,000 cans of olives have been shipped east by local people from Lindsay, Tulare County, mostly as Christmas gifts.

Horticultural Commissioner Haupt of Kings County reports total value of fruits produced in that county for 1921 over four million dollars.

There are 1,000 acres planted to pomegranates in the Lindsay, Exeter and Porterville sections of Tulare County; 600 are in bearing trees.

An apple growing contest is proposed as one activity of the Santa Cruz County farm bureau. A committee has been appointed to take up the matter.

The Sun-Maid Growers has found the little five cent package the quickest seller on the market. More than 1200 women are employed in packing the "Little Sun-Maids."

A convention of grape growers at Fresno, January 26-27 is being planned by the Sun-Maid Growers. Cultural matters will be discussed as well as matters relating to the future of the grape industry.

The Tulare County Pomegranate Growers' Association is sending pomegranates to the department of agriculture at Washington and to the state university for experimentation in the making of dyes.

Experiments in canning apples for commercial purposes are now being made. Apples used in the test were shipped from Hammond, Tulare County, to the San Francisco concern making the experiments.

Recommendations that the Sequoia national park be enlarged soon to include Mount Whitney, Tehipite Valley and the Kings and Kern River Valleys were made by Secretary of the Interior Fall in his annual report.

Among the speakers secured for the Fresno convention of Grape Growers January 26 and 27 are President Giffen of the Sun-Maid Growers, R. L. Nougaret of the state department of agriculture, Elmer Snyder of the United States department of agriculture, and Horticultural Commissioner Roullard of Fresno County.

The Owens Valley Herald says: "Twelve inches of snow and approximately three inches of rain was Mother Nature's Christmas gift to the Bishop section of the Owens Valley. And not content with this generous contribution to the holiday season the good old lady stored up in the big Sierran savings bank of the valley from three to six feet of snow for future use."

Southern California

Imperial County is planning great things for its 1922 fair.

Orange picking, stopped by the rains, has been resumed.

The Imperial Valley marketed over 10,000 carloads of lemons last season.

It is expected that many vineyards will be set in northern Imperial County.

Myron M. Winslow has been appointed farm adviser for Riverside County.

Apple growers of Costa Mesa, Orange County, have formed an association.

Committee in charge of the National Orange Show has plans completed for the 1922 event.

Anaheim orchardists are raising fund to build levee to turn the Santa Ana back to its old channel.

It is estimated that several hundred additional acres will be set to grapefruit in the Imperial Valley.

The government has acquired title to North Island, San Diego, through payment of \$6,000,000 to the Spreckels Corporation.

California Walnut Growers' Association has a force of several hundred hands on extracting and sorting meats of cull nuts.

The walnut growers' institute at Santa Ana, January 13, is expected to bring together walnut growers from all Southern California.

Teachers of San Bernardino County in session resolved that petition be presented to directors of the National Orange Show to eliminate gambling features.

The Japanese Association in the Imperial Valley has decided to cooperate with the lettuce growers in establishing a daily quotation at Brawley.

At the 25th annual meeting of the Upland Citrus Association it was shown that 1,047 carloads of fruit were sent out during last season, for which \$1,174,923.83 was received.

Horticultural Commissioner Call of Ventura County says that approximately 60,000 acres have been covered by rodent control work in that county and over three tons of poisoned barley used.

Representatives of fruit growers associations and packing houses in San Diego County recently met at the call of the county horticultural commissioner to discuss problems of pest control.

Mr. Braunton of the California Cultivator will speak before the Associated Farm Centers of the San Gabriel Valley at the Spinks Ranch, Duarte, at 2 o'clock on January 20. The subject is avocado culture.

Cattlemen of Southern California met recently in Los Angeles and discussed matter of forming an association to aid members in securing loans at reasonable rates of interest. The movement was started through suggestion of the war finance board.

The city attorney of Los Angeles has filed application with the state railroad commission for rehearing of the recently granted 50 per cent increase in rates. The service rendered is according to the city attorney, deplorable. The waiting list for new telephones is said to be 11,596; for changes of phone, 5,635.

The Coast and General

Oil olives are still being picked in Arizona.

Oregon's 1921 hop crop is estimated at nearly 11,000,000 pounds.

From 85 to 90 per cent of the Arizona cotton crop has been picked.

Farm and home week at University of Arizona at Tucson, January 16-21.

Oregon Beekeepers Association meets at Pendleton, January 26 and 27.

Churchill County, Nevada, shipped out 700 carloads of alfalfa hay during 1921.

Rain and snow have fallen over the major grazing sections of Arizona and New Mexico.

The Western Royal Swine Breeders Association holds its sale at Spokane, February 21-22.

Washington Growers Association convenes in annual meeting at Vancouver, January 10.

The last week of December was farmers week at Oregon agricultural college, at Corvallis.

Secretary of Agriculture Wallace has recommended postponement of the World Dairy Conference till 1923.

The Ohio State Dairy Show will open at the Ohio state university on January 30 and run until February 3.

The raspberry pool for growers of Lane County, Oregon, brought to growers 8½ cents for red and 10½ for blackcaps.

The Idaho-Oregon Honey Producers Association at its recent annual meeting decided to hold extracted for better market.

Growers of Marion County, Oregon, have organized the Willamette Valley Flax and Hemp Growers Cooperative Association.

Mole and gopher trapping is being pushed in Tillamook, Oregon, by the United States biological survey co-operating with the farm bureau.

There was great increase in livestock grazing permits for national forests the past year. In cattle an increase of 16,915; sheep, 141,276.

The Lake (Washington), Fruit Growers Association is considering marketing next year through the North Pacific Cooperative Berry Growers Association.

Absence of rain and stormy weather in the Salt River valley of Arizona has favored cutting and crating lettuce and its shipment to eastern points has gone forward without interruption. Quality is excellent.

Annual meetings of state farm bureau federations at Fargo, North Dakota, December 29-30; St. Paul, Minnesota, January 3-4; Huron, South Dakota, 4-5; Lincoln, Nebraska, 4-5; Dallas, Texas, 4-5; Des Moines, Iowa, 10-11; Baltimore, Maryland, 10-12; Springfield, Illinois, 11-12; Columbia, Missouri, 17-18; Columbus, Ohio, 30-31; Madison, Wisconsin, 31-February 1.

The fruit growers' association of Washington, Oregon, Idaho and Montana will send representatives to a conference at Spokane, January 21. Another of commercial marketing associations will be held in February. It is hoped to co-ordinate marketing and advertising effort throughout the Northwest.

FEW people realize the specialized knowledge required to provide the daily meat for the table. Fewer still realize the many changing complications that surround the marketing of meat, and it is this difficulty in making known a constantly changing situation that brings into rabid dispute any particular statement about percentages of profit of packer or retailer.

The utmost any well intentioned farm paper can do is to secure the opinions of men who should know. Not long ago J. E. Robert, secretary of the Cattle Association here (who by the way is the Roberts of the former Adams and Robert of the XL's and well known through the Middle West), made a statement relative to cut proportion and was severely contradicted by the head of a group of retail chain stores.

I do not propose to describe in full the retail situation, except to state that a long held opinion of mine was recently suggested through Hurd, who owns some retail shops. That is that one cause of the present retail meat price is the fact there are more shops than business and a tremendous waste of man power, rental, light, space and energy. Also that a license system limiting the number of retail meat shops in proportion to population could effect a tremendous saving to the consumer, as a gross profit percentage could be established. All such a system would require would be a city ordinance. It is nothing new, as the government operates all trading post licenses upon Indian reservations upon the principle of a business volume and a maximum 25 per cent profit, and the person who breaks the rule quits and moves.

There is no question but that a greatly higher price than is justified is being charged to consumers by retail butchers. Upon the present meat scale 30 cents is a high price for T-bones, and 35 plenty for the choicest lamb cuts, and I will be pleased to prove it to any disputing retail profiteer.

Now, getting down to carcass prices, the packers list with its 12½ No. 1

steers and 11½ No. 1 cows, etc., is merely a fiction. This is something that makes some folks believe packers make more than they do, as the packing profit is always made in its bulk in other ways as I will show later.

When beef was 14 cents live weight all a killer required was to kill white and cover. Today with beef on the 5 to 6.50 live basis what is required is heavy cover, large cod in steers, heavy kidney fat and high finish. Of course this is bunk, as there is no retailer or consumer who cares for this heavy cover, beyond its keeping quality, as there is too much waste. The packer likes the heavy cover as it makes a steer go the 60 per cent if he shrinks it enough instead of 52 per cent, and that 8 per cent is nice in itself. Now when there are many heavy steers the premium goes to light smooth fat cattle, and when many light cattle, to the heavy ones. This is one of the ways of extracting the profit. Not many months ago if you had 1300 pound fat steers they were "too heavy," "wouldn't sell," etc. Today the come in buys are light cattle, and the fed held packer cattle are heavy, hence "light stuff" sells slow, etc. Between light and heavy cattle there is here today a 2 cent variation dressed carcass price.

This class manipulation is varied with location price. The custom is to pay higher for outside stuff as that nearby has to come in and competition will bid for the outside stuff.

With the list on No. 1 steers reading 12½ the general price being charged for good fat steers is 11½, and many are getting an 11 cent price. With the fat cow No. 1 price at 11½, if you can find any retailer who knows how to buy paying over 10 cents, you are a close trailer. Nor is it all milk and honey in this packer trade. They cut and slash and fight for volume, and today most of the packer profit is due to

three things, a good sales organization, volume and clever business tactics. The packer salesmen may sell a carcass low to a small buyer who has had a cheaper quotation, but when it comes to lambs or pork or coney or something else the price may run up several cents. I found a variation of two cents on cow beef price in ten miles and of three cents in same district on coney. We know that volume carries a profit. The business tactics comprises "other ways." I have already mentioned the heavy and light carcass price changes and shifts and locality price shifts, but will merely mention lamb carcass prices to illustrate. Not many moons ago 12 cents was a milk lamb carcass price, today it's 20 cents, and they are off of milk.

Most of the lambs were bought up a month or so ago on a 5 cent f. o. b. range price, and that meant about \$3.50, but many were headed off at less. When the supply was fairly done these lambs advanced a couple of cents, and the carcass price climbed nicely. Today an average lamb is 20 and yearling lamb 16 carcass price, although one retailer claimed to me he is buying milk lambs now at 16.

I hate to comment about the profit of these lambs, as every bunch would be different, but one bunch I know figured as follows: Bought Inyo County to producer, \$3. Killed Los Angeles, 37 pounds at 20, or \$7.40. Retailed Los Angeles \$11.10 per head. Now business tactics did well on lambs lately. They did well twice this year on hogs. At this writing a hog brings 8 cents live weight, and hogs go up and go down. When down they are bought up fast and put into pickle for hams and bacon, and when they rise all that goes with them. When pickle stocks are low and need replenishing Mr. Hog drops in price again, and so on. This is also business tactics.

It is not all milk and honey, as stated before, and if we were all as smart as these packers and killers we would probably work our own business to make it equally profitable in production.

Today a fat old dairy cow, the mother of the herd, with a thick fat cover, will bring a better price than a light two year old button heifer with a light cover. There is no comparison in meat quality or eating tenderness, but the old, heavy, fat cows bring the premium. Some of the Los Angeles shops are buying light cover cattle today at 6 to 9 cents per pound carcass price. These shops could easily sell good meat, not fat, but nutritious, tender, lean meat, from 8 up to 20 cents for the best cuts, and they wouldn't go broke at that.

I know one shop, a one man shop with almost enough business to keep a man occupied half the time, which is selling ten cent cow beef on a ten to 30 cent scale and making \$20 a day profit. I know another man who with one helper is cutting four cattle a week and selling at ten cents for better cuts under a shop in the same town which has two cutters, one cashier, two delivery men and a manager, that handles seven head a week. The man handling the four head is making money, and the other also, but the low expense man is making more.

They can't talk breeding with this sort of cattle situation except for one thing, and that is breeding for weight. With the old dairy cow selling a cent or so under the almost pure bred Hereford beef steer, breeding incentive, beyond mere weight, is not a forceful argument to a cattleman. The present slaughter situation is killing off better breeding and better production in beef about as fast as any policy it is possible to suggest.

Carcass beef prices can stand the list and a cent more today on the retailing margin, and hurt no one except shave a mere sliver from retail profits, but with a maintained list and a cent advance there is nothing whatsoever to prevent an eight cent live weight steer price, and that would permit a living profit for the producers who are now in a desperate plight.

Carcass Meat Prices

By A. L. Spellmeyer

January in the Vegetable Garden

Northern California

By A. R. Gould

HAPPY New Year to all my readers! It looks as though the rains have brought us chances of prosperity and will stimulate all our vegetable gardeners.

Now is the time to get busy for a fine seed sowing program. There is now no excuse as the soil will soon be in excellent shape to work. Those who cleared up the plots last month in readiness will be able to now dig in the manure and get them into shape for planting. Use lime on heavy and sour soils and work into the surface. Secure only the best seed from reliable seedsmen as it is of the utmost importance to the grower. Poor seed means waste of time, labor and money, and the best seed is produced at considerable expense by seedsmen with a reputation who pride themselves on the quality of their product. The writer is frequently in touch with the seed testing grounds of California seedsmen and admires their honest efforts to give the growers the best. A time saver is the wheel plow and cultivator. Peas, beets, turnips, etc.,

may be drilled in with the aid of the seeder and attachments and the home gardener should not be without one.

Peas

This crop in the more sheltered positions on the slopes is making great headway. A fairly rich well drained soil is essential to success, as is also frequent cultivation as the season advances. The main crop varieties should now be sown and the tall varieties we advise are Alderman and Abundance. Dwarf types are Little Marvel, Stratagem and Yorkshire Hero. The edible pod type is Melting Sugar and it is a favorite with many. Sow thinly in rows at least 3 feet apart. If troubled with aphid spray with Blackleaf 40.

Spinach

If sown as advised last month will soon require thinning to 8 inches apart in the row. Still time to sow Bloomsdale and New Zealand varieties.

Lettuce

Sow Los Angeles in rows 18 inches apart. Transplant any thinned from a previous sowing.

Turnips and Kohlrabi

Sow thinly on richly prepared soil in rows 18 to 20 inches apart. Early

Snowball and White Egg are good turnips and Early White kohlrabi should be sown at once.

Parsley

Make a sowing of Moss Curled around the edge of the garden plots. Sow seed very thinly.

Radish

Sow Crimson Giant Forcing which is the best solid, crisp radish grown. Icicle is also a good white variety. Sow in rows 12 to 18 inches apart.

Onions

Main crop varieties, Ailsa Craig, Prizetaker, Yellow Globe Danvers and Australian Brown should be sown at once in rich soil, finely prepared, in rows two feet apart. This plot should be dressed with soot before sowing. Seedlings thinned from the earlier sowings may be transplanted to other plots. As the soil gets into condition use the wheel cultivator between the rows.

Carrots

Sow the early French Forcing variety in rows 18 inches apart in fairly rich soil very thinly and an early crop will result.

Asparagus and Rhubarb

Still time to plant out asparagus,

Palmetto and Conover's Colossal and Rhubarb Victoria and Crimson Winter in trenches six inches deep and four feet apart. Top dressing the old established plots with farmyard manure should not be delayed.

Strawberries

Plant Brandywine, Banner and Everbearing in rows two feet apart in well manured soil on ridges.

Raspberries

Plant St. Regis, Cuthbert and La France, and these should be supported by wires on a fence. Plant in rows at least four feet apart. These are a profitable crop and planted on a fairly heavy soil richly manured yearly should give good returns.

Southern California

By D. F. Reichard

WE were going to tell you just how to get your ground thoroughly soaked preparatory to having it worked up—but—well, it's not necessary to explain. Wasn't it great! The best thing to do now is to scatter a good dressing of manure over the land to be used for garden, and work (Continued on Page 8)

Rudiments of Citrus Fertilization

By E. L. Koethen

THE first essential to all true fertility for economic crops is humus. Without it it is futile to attempt to build up any kind of soil productivity. It may avail for a time to draw upon the natural humus content of the soil but in the end it spells disaster to attempt to get along without it. It is the soil solvent which makes all kinds of inorganic forms of plant food available. It dissolves phosphoric acid which may have been locked up for years. It does the same for the natural stores of potash which nature deposited there for future use but which are unavailable because in forms which the plant cannot reach. It is the home of most of the nitrogen compounds upon which the plant must depend for sustenance.

What is humus? Well, who knows? The scientists differ in their definitions of it, so we laymen must be content to say we do not know from a scientific standpoint, but we can adopt a definition that is understandable to us and that is all that concerns us. It is decayed or decaying organic matter, animal or vegetable. The mechanical effect of decayed or

decaying matter is the same practically, but it may be more active as a chemical agent when decomposed. It is not to be assumed that when organic matter has disappeared in the soil as far as the eye can detect it, that it is no longer of use to the grower. On the contrary, it is still active and still at its best as long as it is in the soil. It is a common remark among orchardists that green matter plowed under "disappears within a couple of weeks and is lost." That is just what is wanted of it.

The more humus we can store in California soils the better. They are naturally deficient in it, especially in the top layers. As a matter of fact, the lower stratum, the subsoil, is better stocked with it than many of the soils of the humid countries. But it is the upper stratum that we are most concerned with. We are told that in Florida soils the application of manures will cause die-back, but we have so far heard of no such results in California. Without humus our soils are dead and lifeless; it is the home of the bacteria which makes a living thing of our soil; it is indispensable and the problem is where and how to obtain enough of

it. Of this we will treat in another paper.

Humus is of as much importance to us as cultivation or water. Without it the soil becomes refractory, melts down with rains or irrigation, a plow sole is formed, making it impervious to water. The citrus tree will become mottled and show all the symptoms of malnutrition. This, though you have at great cost applied all kinds of rich fertilizers, excepting organic matter. Here is an illustration: An orchard which had received the best of commercial fertilizers in abundance, well located as to soil and climate, but the humus content allowed to run down. As a result, the crops began to fall steadily, the trees became mottled. New growth failed to appear in spite of excellent cultivation and an abundance of water having been applied. A soil test showed a distinct hard crust at about five inches from the surface in spite of deeper plowing each season.

Then the owner began growing cover crops and using organic commercials only, and immediately there began to be a change, and today that orchard after about ten years of organic fertilization is yielding nearly \$1,000 per year per acre in returns for the crops, and the trees are free from mottled leaves and the foliage is large and deep green. The trees make a heavy new growth each year.

The soil is friable, breaks up loose and spongy and is loose, clear down as far as you wish to probe. This is but one case. It can be duplicated many times over. A good farmer knows when a soil "feels right"; that is the way we must have it.

SCALE—JUNE DROP

Here is a little problem I would like to pass on to my brother orange growers through the medium of the Cultivator, who possibly know more about it than I do:

I have lost the larger part of this year's navel crop because my trees were infected with citricola scale, and I would like to know if any one can tell me the how and why of this. The grove was well fertilized, trees blossomed heavily and there was a good crop on them up to the 15th of June when the scale began to hatch and the fruit began to drop and continued to drop for two months, leaving only a light crop.

My own theory is this: The scale insect is only indirectly the cause of the drop; the juice or sap in the leaf which exudes following the bite of the insect, or the honey dew thrown off by it, and which coats the upper surface of the leaves, furnishes a developing medium for black smut or fungus, the spores of which are transmitted to the stamen of the little orange and from there down into the navel, whereupon temperature and sap composition becoming favorable, it develops, causing the little orange to drop. An examination of small oranges which dropped showed a black or dark brown spot, almost invariably consuming the pulp of the navel.

Now for what I propose for a remedy. My groves have been fumigated and the scale partly cleaned up. I propose to spray the trees with the Bordeaux mixture before they come into bloom, say about the first of March, weather permitting, using the same strength used on lemons for brown rot prevention. Has anyone tried this experiment? Does Bordeaux mixture have any harmful effect upon new growth? Why should fumigation be delayed after applying Bordeaux mixture? Part of my groves will have to be fumigated again in the summer, middle of July or later. Would it be safe? Yours fraternally, John Lesler, Redlands.

We will be glad to hear from our subscribers in the matter of this inquirer's experience with citricola. However, if sprayed with Bordeaux in March and then fumigated in June or July, which is the usual time for citricola, it is very probable that trees would be injured. In our issue of October 15 we referred to fumigation injury after spraying with Bordeaux and suggested as the safe limit 10 or 12 months' time between spraying and fumigation. In this case fumigation in July or at latest in August would, we believe, be far more important than spraying with Bordeaux. Then through heavy irrigation and perhaps use of a quick acting fertilizer we would depend on putting the tree in such vigorous condition that it would hold the crop of fruit in June.

BEES AND FRUIT

Extensive tests carried out in New South Wales go to prove that bees do not damage sound fruit, though it has been noticed that where fruit has been previously damaged by birds, wasps, etc., bees will during a severe dearth of nectar suck the juices through the damaged portion, often widening the puncture. The senior apiary inspector says: "From our experience Italian bees go after fruit juices no more than other races of bees. Large numbers of Italian bees have been kept in New South Wales for the past 30 years and apiaries worked in the vicinity of orchards and vineyards, yet rarely has the orchardist complained of any damage; in fact, in many cases fruit growers have offered a piece of their land for the use of the bee keeper gratis, recognizing the advantage to be gained in the way of better pollination. One of my own apiaries of 120 colonies of Italian bees was situated for 15 years within 100 yards of an orchard where peaches and plums were growing, and not in one case did we find that sound fruit was interfered with."

Lower Machine Prices —a factor in a brighter outlook for 1922

MOST of the readers of this paper know that we have reduced our prices on farm machines for 1922. The lower figures apply on practically our entire line of grain, hay, and corn harvesting machines, plows, tillage implements, seeding machines, etc.

Reductions in prices of farm machines and other articles the farmer buys is one of the many indications pointing to continued improvement in the farmer's situation. The War Finance Corporation is steadily pouring aid from its billion dollar fund into agricultural communities to finance the farmer. Freight rate reductions on stock, grain, hay, etc., now going into effect, will save many millions for the farmers. Land values are now on a sound-

er basis. For 1922, better labor at lower cost will be available, better marketing conditions are being evolved, and recent tariff legislation also should tend to increase farm product prices.

All these factors indicate that more efficient production by modern methods and improved machines will mean greater profit for the new year. You cannot afford to postpone the purchase of needed machines. Where repairs have been made again and again, beyond the point of serviceability, waste and loss are pretty sure to follow. The present prices will enable you to replace the old with efficient modern machines so that best use may be made of the opportunities that are certain to come to the farming world.

Walnut Institute at Santa Ana

By Robert W. Hodgson, Farm Advisor Los Angeles County

ONE of the first activities undertaken by the agricultural extension service following its organization in Los Angeles County some four years ago was an annual institute for the walnut growers of the county. A careful survey brought out the fact that although the acreage planted to walnuts was in the neighborhood of 50,000 at that time, now increased to 85,000, it had not been the custom for the walnut growers to meet informally for the discussion of the many problems confronting the industry, and it was felt that a splendid opportunity was open for the initiation of an activity which might prove of decided benefit to the industry. Consequently, in January, 1918, a mass meeting of walnut growers was called at El Monte, the purpose of which was a discussion of some of the principal problems confronting the industry. The result was a decided success, the attendance being more than 200 persons. At the meeting a resolution was passed urging that the state legislature enact a bill providing an appropriation of \$20,000 for the coming biennium for the investigation and control of the new walnut codling moth pest, at that time a decided worry to the industry. The appropriation was secured. The first institute was so successful that the growers expressed the desire to have the activity made an annual event. Each year has seen the institute grow in attendance and interest, the third annual institute held at Whittier last January bringing out an attendance of 525 persons.

The purposes of this annual convention are to build up a stronger organization spirit by bringing the growers together, to bring to light the principal cultural problems confronting the industry by means of mutual conference and discussion, and to bring to the growers the latest results accumulated by the research branches of the state college of agriculture and federal department of agriculture.

The holding of the institute soon led to the conducting of other activities, such as field demonstrations on dusting and spraying for the control of pests, top-working and pruning, and various other subjects, the culmination being the demand for the organization of a walnut growers department of the Los Angeles County farm bureau. Completion of the organization occurred at the first annual walnut growers' field day held at Puente last September, at which some 1200 walnut growers from all parts of Southern California were in attendance. The

phenomenal success of the walnut growers departmental activities in Los Angeles County have led to the organization of similar departments in adjacent walnut growing counties, the most recent of which is that organized in Orange County.

Several months ago the executive committee of the walnut growers department in Los Angeles County, in view of the rapid development of similar departments in southern counties, decided to make the annual walnut institute a Southern California affair rather than to attempt to keep it permanently a Los Angeles County activity. Consequently, the presidents of the farm bureaus in Santa Barbara, Ventura, San Bernardino, and Orange Counties were requested to appoint a special representative to act on the committee in charge of the fourth annual walnut growers institute. The committee as finally formed consisted of E. G. Hotchkiss, Covina; J. E. Killian, El Monte; W. H. Howell, Walnut; Lester Cole, Whittier; Alfred Brant, Owensmouth; J. A. Smiley, Orange; J. P. Thille, Ventura; P. C. Marble, Santa Barbara; H. L. White, Chino; and the farm advisors of Los Angeles and Orange Counties.

A meeting of this committee was held in Los Angeles December 15 and January 13 was chosen as date of the fourth institute, to be held at the high school auditorium at Santa Ana. A splendid program has been worked out consisting of discussions of the principal subjects of timely interest to the walnut growers of the state.

The Program

10:00 A. M.—The Walnut Growers Department, Robert W. Hodgson, Los Angeles County Farm Bureau. Progress report on Walnut investigational work, J. T. Barrett, director citrus experiment station. Cause and Treatment of Walnut Black Sap, H. S. Fawcett, citrus experiment station. Is the American Farmer Awake? W. S. Rosecrans, Los Angeles County farm bureau. Noon, basket lunch, coffee served by local committee. 1:30 P. M., Better Curing of Walnuts before Packing House Delivery, C. V. Newman, Irvine. Final Report on Codling Moth Control, H. J. Quayle, citrus experiment station. Subsoiling the Walnut Orchard, Eugene Kellogg, horticultural commissioner, Santa Barbara County. Establishing the New Orchard, L. D. Batchelor, citrus experiment station.

A feature of the institute will be display of different grades of walnuts produced in other countries.

Whitewash Retarding Blossoming

A year or more ago the Cultivator referred to the fact that deciduous trees sprayed with whitewash late in the dormant period are somewhat later in blooming than their companions in adjoining rows. This matter has been taken up by R. R. McLean of the farm service department of the First National Bank of San Diego and he is recommending a test of trees which bloom so early as to be in danger of late spring frosts. Mr. McLean writes:

"The writer has been in correspondence with Prof. J. C. Whitten of the University of California relative to the commercial practicability of retarding the blossoming period of such trees in the spring by the application of whitewash. Some experiments along this line were tried by the Missouri experiment station at the time Prof. Whitten was connected with it a number of years ago.

"Whitewashing trees is not a new thing by any means, at least so far as the lower limbs and trunks are concerned, but covering the entire tree in a definite attempt to delay blossoming has not been done in California, so far as the writer is aware. The underlying principles that make whitewash of value to fruit trees in general and promise some relief in the matter of frost injury to early blossoms, are unusually interesting and conclusive. Damage Done in Winter

"It is a necessary orchard practice to protect the trunk and larger limbs

of young trees for four or five years after they have been set out. The protection sought for is not from the summer heat, as might be supposed, but from the winter sun, and whitewash is apparently the best and cheapest agent for that purpose.

"It has been proved by experiments, according to Dr. Whitten, that the coloring matter in the thin bark on young trees will absorb enough heat on clear, warm winter days, such as we often have in late winter and early spring, to raise the temperature under the bark from 15 to 25 degrees above that of the air. This has the effect of increasing the activity of the cells and buds, especially on the south and southwest exposures, making them very tender and exhausting to some extent their stored reserves of plant food.

"As the sun goes down the tree quickly cools to atmospheric temperature, which may be nearly to freezing or even a little below, especially if in the higher altitudes, and this wide range in temperature is very likely to injure the buds and growing layer, causing what is known as sunburn, or sunscald. This results in the death of parts of the exposed bark, but as the injury is usually not noticed until the growing season, the summer sun is charged with the damage.

Whitewash Reflects Heat

"If, however, the trunk and larger limbs are covered by an even coating

(Continued on Page 10.)

Your cream won't spill if you haul on Hasslers

WHETHER you put a few cans of cream in your Ford or Dodge Brothers car, or haul it on a Ford truck—the cans won't tip over, and the cream won't spill, if you haul on Hasslers and take a little care.

Think what smooth riding like that would mean to you and to your car. Comfort, greater speed without danger, and no more fear of rough roads. You can make your trips the shortest way instead of going around to avoid a little bad road.

The lively Hassler coil springs cushion the bumps, then act instantly to check the rebound when it starts to throw you from your seat. They stop sideways.

That means lower repair and upkeep cost; a car that stays tight longer; better mileage from your tires.

The famous Hassler action and results are due to the unique Hassler design—you get it only in Hasslers.

You can test Hasslers ten days at our risk. Ask your dealer.

VEGETABLE GARDEN FOR JANUARY IN SOUTHERN CALIFORNIA

(Continued from Page 5.)

it in by plowing or spading ten to fourteen inches deep as soon as your ground is dry enough to work. Then harrow or rake it well so as to get the soil settled and a nice fine seed bed.

In the meantime, some sort of a plan should be worked out concerning this garden you are going to have. First select the piece of ground which for best results should be naturally rich, conveniently watered, of a nature that drains well and with a southerly exposure. The size will be controlled by the space available or the amount of time one wishes to apply to this part of his garden. On a town lot one is usually confined to a space 50x75 feet or less. It is surprising how much can be grown in a backyard if managed properly. On a ranch a house garden should comprise about an acre, as much of the work can be done with a horse. We should decide whether the plot selected is to be a permanent garden, if not, then we will plan on using only annual stuff; but if it is to be a garden for several

years we can figure on using some perennial stuff. These should be planted where they need not be moved, usually to one side of the plot and arranged according to their habit of growth. Vining berries like Himalaya, Mammoth or Thornless blackberries, loganberries and dewberries should be set six to eight feet apart and trained on trellis; raspberries, plant about two feet apart in rows; currants, gooseberries and upright growing blackberries, plant about four feet apart; rhubarb and artichokes should be allowed four feet also, while strawberries are set 15 inches apart in the rows. All of these should be set out as soon as possible so as to get their roots well established before growing weather comes.

As it is now early for setting out tomatoes, peppers and melons, the space intended for these can be nicely used for quick crops like spinach and radishes or it may be used to start cabbage or cauliflower plants, all of which will be out of the way in time to put out tomatoes, egg plants and peppers in March.

Potatoes may be planted in protected places any time now, but in open valleys we would recommend

waiting till March. Cut your seed so that it is about the size of a hen's egg and with at least one good eye. Drop these pieces about a foot apart in a furrow and cover three or four inches. Have your rows 30 inches apart. In order of their earliness we use in Southern California, Triumph, Red Rose, American Wonder, White Rose and British Queen.

Plant a row or two of peas, Laxtonians for a quick crop and Senator or Dwarf Telephone for a little later. A pound will plant 150 feet of row. Give each row two to two and a half feet and cover the seed two to three inches.

Make plantings of the hardier vegetables like parsnips, with which plant a few radishes to break the crust so as to let the slow growing parsnips come on without stunting. Put in carrots, turnips, lettuce, beets, kohlrabi, kale, mustard, spinach and rutabagas. An ounce of any of these will sow from 100 to 200 feet of row, according to size of seeds.

Put in some onion seed for dry onions. An ounce of seed will sow 125 feet of row and should produce 75 pounds of dry onions. Use Crystal Wax and White Queen for Earlies and

for pickling onions, Australian Brown, Danvers and White Globe for summer use and storing.

Set out cabbage, cauliflower and kale plants in rows about three feet apart. Cabbage should be set 15 to 20 inches apart in the rows, cauliflower and kale 24 to 30 inches. Plant all of these in the bottom of a furrow at least six inches deep and gradually work the dirt in around them as they grow.

In protected spots Canadian Wonder and Ventura Wonder Wax beans may be planted. It is early yet for planting sweet corn, melons and cucumbers. So, in planning the garden, be sure to reserve some space for those things that cannot be planted for a month or so.

This is the best month in which to prune trees, berry bushes and grape vines. Clean them out and spray with lime-sulphur solution. Cultivate your growing crops, thin out stuff planted late in November and early December. Keep on the lookout for aphids. Spray with Blackleaf 40 or dust with the new dusting compounds. This dusting method is proving very effective and economical.

Southern Arizona

By M. E. Bemis

PLANT growth in January is usually not rapid. Sometimes the coldest weather of the year comes in this month, and as a rule there are many frosty nights. In spite of this there is considerable that can be done in the garden, and as the days begin to lengthen perceptibly towards the end of the month it is well to make a considerable effort in planting and planning for the more active work which follows in February and March.

The list of things to be planted in January includes beets, carrots, collards, kale, kohlrabi, lettuce, mustard, onion seed, onion sets, parsley, parsnip, peas, radishes, spinach, Swiss chard, turnips and cabbage, cauliflower and strawberry plants.

The common root crops such as beets, carrots, onions and parsnips, as well as parsley and lettuce, are best planted in narrow drills 15 to 18 inches apart for garden culture and two to three feet for field culture. In depth they should be planted from one-fourth inch to one inch, the smaller seeds as a rule requiring a more shallow planting. Germination is slow during the cooler weather. The most common practice is to plant on the sides of furrows just above the water line. With a fine sandy soil it seems advisable sometimes to plant flat, but with heavier soils the furrow system is usually necessary.

Proven varieties for the January plantings are: Crosby and Extra Early Egyptian beets; Ox heart or Danvers carrot; Georgia collard; Green Curled Scotch kale; Purple and White Vienna kohlrabi; New York, Iceberg and Prizehead lettuce; Ostrich Plume and Southern Curled mustard; Yellow Danvers, White Portugal, Bermuda, and Crystal Wax onions; Champion Moss curled parsley; Hollow Crowned parsnips; early varieties of peas such as Alaska or American Wonder; Epicure, Early Long Scarlet or Long White Icicle radish; Prickly or Round spinach; Silver Swiss chard; Purple Top White Globe or Early Snowball turnips; Early Winningstadt, Selected Early Jersey Wakefield, Danish Ballhead or Selected Early Flat Dutch cabbage; Hendersons Early Snowball cauliflower, and Arizona Everbearing strawberries.

Early planted lettuce is being shipped out in carload quantities, but later plantings will continue to come on and mature for some months. Most of the varieties of vegetables and plants that are seasonable for planting now are also being harvested from earlier fall plantings, but plantings up to as late as March and in some cases even later may be made, thus insuring a succession covering a long period.

A potato specialist from the federal bureau of plant industry has been assigned to study Southern California problems. He will arrive December 20 for a preliminary investigation in connection with the potato growers' department of the Los Angeles County farm bureau.

KIRKMAN NURSERIES

Established in California in 1888

WHY build a new fence every few years and be annoyed with constant repairs?

RED TOPS give you a strong—permanent fence line. The staples don't loosen—the posts can't burn. No holes to dig—they drive like a stake.

They cost less in the fence line than wood or concrete posts—and practically eliminate repairs. Made in angles and tees.

This Month in the Ornamental Garden

Southern California

By Ernest Branton

BY reason of the unusually heavy rains which fell around Christmas week nearly all minor garden operations indulged in during December will have to be done over again. Not only were seeds washed out but in many cases small seedlings on sloping lands were almost a total loss; still others of the more tender class were broken or beaten to pieces by the excessive downpour. But almost anything planted from seeds in December will grow better from January sowings.

Really the most serious result from the heavy rains is the beating down to extreme compactness of heavy soils and even medium soils need lightening and aeration. Few realize the terrific force of heavy downpours on the soil surface, but no roller yet built can so compact and force out the air. When soil is dry enough turn it up as deeply as possible and leave it to "weather" until the area is needed for planting. But do not attempt to work it or upturn it until it is sufficiently dry through drainage from below. This is the most important of garden work looking to the welfare of plants in the future. When working soil incorporate more fertilizer.

Watch for little wads of garden rubbish that have lodged in corners and out-of-way places where insects and other pests may find harbor, and consign it to flames or compost heap.

Belated rains suggest belated sowing, and the time is ripe and right for seeds of native plants. In fact, January should be the most important planting month of the season. Citrus growers contend that little danger from heavy frosts portends after January 15. After that date there remain two weeks of the month during which all hardy trees and plants should be set out, especially deciduous material, for no time is better suited to its needs. With promise of normal weather another sowing of sweet peas should be made to provide spring blossoms, the last sweet peas to be planted, for hot weather does not produce large flowers, delicate colors nor long stems, for all of which weather and soil should be cool and moist. For later flowers sow seeds of aster, celosia, cockscomb, coreopsis, chrysanthemum (annual sorts), dianthus and other pinks, phlox, salvia, snapdragon and stocks. Consultation of the modern seed catalog calendar will give one all the possibilities in seed sowing for the month, and you may choose your favorites from the list.

The hardier perennials, such as goldenrod, golden glow (rudbeckia), etc., will soon start top growth and roots should be divided, transplanted or cultivated and fertilized as you may elect. Cut off tops of Matilija poppy plants at top of soil so new tops will spring up. Do not cultivate except superficially to destroy weeds, or apply fertilizers, but the present is a good time for moving or dividing the roots, but do it at once—a month later is too late. Last year's clumps of chrysanthemums will break forth and need division or propagation by cuttings, or both. A box of clean sharp sand in a shaded position well protected from winds is a good propagating equipment for hardy cuttings but equable soil moisture must be maintained or failure will result.

Bulbs in variety may now be planted, especially of native sorts, which should be planted deeply, not less than six inches. Holland or Dutch bulbs are still in season but the last planting should be made at once. A general list, including Easter lilies, is not long: anemone, ixia, narcissus, oxalis, ranunculus, sparaxis and tulip. The best success with gladiolus flowers usually comes from January planting. Anemone and ranunculus sprout quickest and are surest if bulbs are soaked in water for 24 hours before planting.

Dormant roses may now be had and are the best of all to plant. Deciduous trees and shrubs, either fruit, ornamental, or both; trees and shrubs of evergreens, except of tender sorts,

Spray Your Way to More and Better Fruit —and Bigger Profits

Effective spraying works miracles. It turns unprofitable orchards into money-makers. It makes profitable orchards more profitable. It often spells the difference between success and failure. But effective spraying demands adequate equipment. You can't do good work with an inferior rig or one that's too small for the job. If your own equipment is inadequate in the light of today's knowledge of spraying importance—replace it at once! You'll find just the outfit you need somewhere among the various sizes of

"Bean" Power Sprayers

Thirty-seven years of experience are built into these good sprayers. The results are shown in the many outstanding advantages found in the Bean line.

The Bean Pressure Regulator holds the pressure exactly where you want it, saves wear and tear on engine and pump, and enables you to remove any valve in the pump without losing the pressure or stopping the engine. Bean Threadless Ball Valves can't corrode or stick tight—and can be opened up entirely in less than two minutes.

Bean Porcelain-lined Cylinders wear and wear. The Bean Pump has no stuffing-boxes—and no stuffing-box trouble! All Bean parts are readily accessible and can be quickly and cheaply replaced. The new Bean 6 H. P. engine is a perfect solution to the problem of sprayer power. Light; compact; self-contained. Runs surprisingly free from vibration even under full power. Can be used for all kinds of power jobs when sprayer is not in operation.

The new Bean prices represent an average saving of \$100 on Giant outfits. That's good news, too!

Sign and send the coupon now and get the full details of the Bean line for 1922.

may now be set out. Train and tie climbing roses but do not prune Banksias, Cherokees, Beauty of Glazenwood or Gold of Ophir or you will prune away dormant flower buds. Prune all such, if pruning is needed, at close of blooming period. Violets and carnations planted now as tiny plants will grow all summer and provide good flower crops for the holiday season at the close of 1922. Do not yet fertilize lawns, heavy rains may carry all the nitrogen away, active growth of grass comes later, food is needed in greatest supply when most rapid growth commences.

Northern California

By A. R. Gould

ACTIVE planting should now be under way as this is an opportune time to transplant. Many shrubs may be secured and some pleasing groups arranged. Where close planting has been practiced it will be possible to move plants to positions where they may have more room to develop.

During the wet weather when outdoor operations are impossible dahlia tubers should be carefully sorted over and gladiolus also begonias should all be inspected for any diseased bulbs or tubers must be removed. Dry sand is a good medium in which to store these.

The lawns should also receive attention at this time and may be top-dressed with sheep manure, bone meal or dried blood. This will put them in good order for the coming season. New lawns may be put in as the weather gets warmer, but this will be better if deferred to next month as the seed will germinate much better, when we shall give hints on new lawns in more detail. In the meantime we would advise having the proposed plot deeply trenched and prepared.

Seed Sowing of Annuals

Boxes of leaf soil should now be prepared and placed in a sheltered but warm position and frame covers prepared to protect from the rain. Annuals such as snapdragon, godetia, clarkia, stock, candytuft, centaurea, dianthus, larkspur, lavatera, phlox

drummondi, schizanthus, viscaria and scabiosa, all are easily transplanted and if sown now will give a long succession of bloom.

The New Lace Flower

Dediscus coerulea is a graceful flower of light blue, a popular shade just now in the garden, and may be easily raised from seed sown in a box of fine soil. It is useful as a cut flower and is also delightful in the border. A packet of seed will furnish quite a number of plants.

The Perennial Border

Work on this border should be progressing and any large clump of hardy aster, iris, canna, chrysanthemum, columbine, oriental poppy, helianthus, sweet william, pentstemon, etc., may be divided and new borders prepared for planting in color groups, and here we would like to impress upon our readers the fact that there is nothing quite so satisfactory to grow as a perennial and nothing more beautiful and lasting than a well arranged grouping in color.

Delphiniums

These flowers have of late become

extremely popular and rightly so as one can secure them now in almost every shade of blue and in heights from 12 inches to 5 feet, double and butterfly types. They flower from seed the first year if sown early and should be sown at once in a box of well prepared soil. They are somewhat sensitive to excessive moisture and the seedlings therefore must be watered with great care. Strong plants may be secured from the nurseryman for planting in March.

Bulbs

There is still time to plant tulips and lilliums. Plant in well manured soil, placing a little sand at the base of each and place them at least four inches deep.

Roses

These may still be pruned and cuttings inserted in sandy soil. This is also planting time and you should get your order in early for the best stock.

Evergreen Shrubs

Eunymus hakea, coprosma, acuba, abella, ionicera nitida, melaleuca and leptospermum. Any of these will give satisfaction grouped or as single specimens, planted now.

Berried Shrubs

Cotoneaster pannosa, C. horizontalis, C. angustifolia, C. microphylla, C. acuminata and C. Franchetti, Crataegus celandii and C. crenulata. Most of these may be seen just now in full glory with their brightly colored berries, and small plants may be secured in pots to plant out in groups where they will make an effective display another season.

Sweet Peas

These must be watched for aphids as they are usually very troublesome at this season. Spray with "Black leaf 40." Keep the vines tied to the stakes as severe winds are likely to severely damage them. The winter flowering types should soon be coming into bloom.

WHITEWASH RETARDING BLOSSOMING

(Continued from Page 7.)

of whitewash, the heat of the winter sun will be reflected and the temperature under the bark will be several degrees lower than the atmospheric temperature, the buds and cells will remain thoroughly dormant and uninjured though the extremes in temperature may be great.

"In the summer, even if it be very hot and dry, the upward passage of cool water from the roots and its evaporation from the twigs and leaves cools the parts of the tree above ground so that they are frequently from 15 to 20 degrees below the temperature of the air. For this reason sunburn does not ordinarily occur in the summer when sufficient water is supplied the roots and the normal leafage on the tree is maintained.

"Although the bark of older trees is much thicker and less liable to sunburn, it is nevertheless good practice to whitewash exposed trunks and bare main limbs.

"Because of the fact that whitewash has been proved to lower the temperature of the buds and keep them dormant in spite of the hot days occasionally experienced, it has been determined that if the entire tree is kept covered by it during the winter, the blossom buds will be so much delayed in the spring that they will escape late frosts that are often disastrous."

NAVEL ORANGE PRUNING DEMONSTRATIONS

During January a series of nine navel orange pruning demonstrations has been arranged by the Los Angeles County farm bureau: January 25, 10 a. m. Pasadena, 2 p. m. Monrovia; 26, 10 a. m. Azusa, 2 p. m. La Verne; 27, 10 a. m. Covina, 2 p. m. Pomona; 30, 2 p. m. San Fernando; 31, 10 a. m. Whittier, 2 p. m. San Dimas.

PACKERS OF AIRLINE HONEY

INCREASING USE OF LIME

The lime country is the rich man's country. There the clovers and alfalfa and other legumes are at their finest. Generally California is rich in lime. But there are sections where more is required and the producer who is succeeding is investigating his soil and the use of more lime, and where needed he is putting it on. Again there are others who are proceeding as did the Dutchman when he said, "Shentle-meens, a leetle too much lager beer is shust right."

Not every crop needs an excess of lime, but the great majority of our staples will do best in lime soils. California is rich in lime deposits and but few sections are so far away as to make liberal application unduly expensive. Perhaps the greatest benefit from use of lime is in its encouragement to bacterial action so that organic forms of nitrogen are reduced to a nitrate or available form. In addition to this effect upon soil conditions lime often proves directly beneficial to the plant. One of Florida's most noted authorities says:

"Much of the fertility of the soil depends upon the number and activity of soil bacteria. These liberate plant food and make it available so that the roots of trees and other plants may take it up.

"Soils, especially in warm climates, have a tendency to become acid and under such conditions the bacteria cannot live.

"The presence of lime counteracts the acid condition and it should be applied whenever necessary. Furthermore, it helps to bring about the decomposition of humus and liberates the nitrogen which it contains. Large amounts of plant food may be liberated by or through the use of lime; hence, in applying it to citrus groves it is best to use it sparingly or, at the time of its use, discontinue the nitrogenous fertilizer and depend upon the amount of nitrogen liberated to make up the deficit.

"In the plant the presence of lime appears to favor the formation of stronger cell walls and thus aids in making the trees stronger and more sturdy. Citrus trees planted on soils fairly well supplied with lime have a tendency to mature their fruit somewhat earlier and the fruit is bright and clean."

In addition the Ohio agricultural college tells the story of a man who wrote the lesson of lime on a Carroll County hillside so that all who passed could read it.

"In 1914," says Professor Jones, "Emmett Belknap, a farmer of Carroll County, applied with a lime spreader about a ton and a half of ground limestone to part of a hillside pasture on his farm. In 1915 and 1916, because he had some limestone left, he made one round with the lime spreader on the same field toward the foot of the hill. This fall the two green strips where the spreader had gone across a second and third time could plainly be seen all the way across the valley. It was a spectacular demonstration of the possibilities of improving land through limestone.

"Closer examination showed that bluegrass and white clover have come in on the limed land, displacing weeds, poor grass and moss, which abounds in the untreated portion of the field. The line between treated and untreated pasture is distinct. Mr. Belknap was so struck by the improvement that he has since limed three other pastures on his farm.

CONFERENCE ON COLORADO RIVER

Secretary of Commerce Hoover has fixed January 26 as first meeting date of the Interstate Colorado River Commission. Steps to control the river's flood waters and allocation of the water for irrigation purposes as well as the plans for development of power will be discussed preparatory to an intensive study of the problem.

Following this conference Secretary Hoover will go to California for several weeks to study the subject personally and will visit Los Angeles, San Francisco and other Coast cities.

THE WHINERS

I don't mind the man with red-blooded kick,
At a real or fancied wrong;
I can stand for the chap with the grouch,
If he's quick
To drop it when joy comes along;
I have praise for the fellow who says
What he thinks,
Though his thoughts may not fit with mine,
But spare me from having to mix with the ginks
Who go through the world with a whine.

I am willing to listen to sinner or saint
Who is willing to fight for his rights,
And there's something sometimes in an honest complaint
That the soul of me really delights,
For kickers are useful and grouches are wise,
For their purpose is frequently fine,
But spare me from having to mix with the guys
Who go through the world with a whine.

THE MAID AND THE ALBUM

By Clara Peterson

ONCE upon a time there was a very efficient ruler called Sir Compe Tent. Oh, he was so efficient! His palace had lightning rods and dumb waiters and vacuum cleaners and his cows were milked by electricity and the minute one of his hens got through laying an egg she pulled a string with her bill; this worked the little dating machine over her nest and there the egg was dated as nicely as you please!

Sir Compe's white stone palace was washed every other year and his white painted picket fence was given a shining new coat every other month, but outside that fence things were in just alarming shape.

There were cunning little crooked streets with beds of flowers right in the center of them and there wasn't the slightest bit of system to the houses. Some were untidy brown with sprawly rose vines crawling over them and scattering pink velvet petals on the grass. Some were cloudy grey with little crisscross windows and hollyhocks white and red standing here and there against them. Others were yellow and cream and blue with front yards short and front yards long and fruit trees blossoming just anywhere they happened to spring up.

Sir Compe had been extremely busy writing a book on "How to Have Time to Attend to Everything," but now it was finished. He took off his black rimmed glasses and rubbed his fine blue eyes after he had written the last word. He stood up and stretched mightily and waved his arms to get the roundness out of his shoulders. He folded the manuscript proudly and went out for a refreshing walk.

It was then that Sir Compe realized that there was no system in his city outside the palace grounds; people were living just as naturally and comfortably as they pleased. He went home sadly. To think that immediately upon his return from college he had gone to work on his book and had neglected his people entirely!

He vaulted his picket fence and sat down on a green bench to think it over. There wasn't one leaf on the grass as far as he could see so he had nothing to bother him.

"I shall give them a most welcome surprise," said Sir Compe to himself. He got up to put a grasshopper outside the fence. "All the houses shall be changed so that they look exactly alike and they all shall be painted white, a shining city indeed. We shall have grass in the front yards and vegetables in the back yards and the stone pavements shall be scrubbed each morning by my men. The palace shall do without anything new this year in order to pay for it all."

He went up the marble steps into his scarlet study where he wrote this out very clearly on the typewriter:

"Tomorrow the whole city will know about it," said Sir Compe, rubbing his hands and chuckling. "And just to show the people that I want them to be satisfied with everything I'm going to write at the bottom of the proclamation that I shall expect every householder to visit me this week some day between six and seven in the evening. Then I'll give each one his choice of four or five windows in the living room and round or square pillars for

the front veranda. This can be managed easily."

Sir Compe could hardly wait for the next evening to come. He didn't realize that this was because he was lonely and wanted to see his people and know them and chat with them.

At five o'clock Sir Compe was all ready for the first grateful caller, dressed in his scholar's robe of black with only the plain gold band of the Tents on his head to show that he was ruler. He sat on his throne and tried to read, but all he did was watch the minute hand of the ebony clock go round and round. He was hoping that a few of the jolly fat townsmen would drop in for tea.

But teatime came and Sir Compe was alone. A maid brought in the tray, a tall, grey eyed maid, sleek haired and slim as a birch tree. Sir Compe looked up and wished that she would smile; he had never seen her smile. Then he looked down at the tray and he himself smiled gayly, for there was chicken salad and chocolate cake. He thanked the maid and began to eat, very slowly, still hoping someone would drop in.

But that whole evening the ruler sat in the throne room and not one person came to call. That was Monday night. Five more evenings in which to talk with the jolly fat townsmen and get acquainted; he hoped they would not come in a bunch.

Tuesday night. Veal pie and cherry cobbler, enough for twelve. Till ten o'clock Sir Compe sat and waited. He looked over all the latest magazines; he polished his spectacles for half an hour; finally he just leaned back in the great gilt chair and whistled lonesomely.

At nine o'clock the grey eyed maid, who happened to be passing through the hall, peeped in the half open door. Sir Compe had whistled every tune he knew and was sound asleep, the light from the crystal chandeliers blazing down upon him.

The little maid tiptoed in and turned out the lights nearest the throne. Sir Compe's head was bent upon his arm like a little boy's and his face was ever so sad. She stood looking at him and two crystal tears rolled down her cheeks. For once, when she was a tiny girl, the maid had visited the palace with her parents of high degree and she and little Compe had played together and had sworn when they parted never to forget each other so long as the world stood. And now she was alone and through misfortune had had to earn her bread. She had come to the palace hoping Sir Compe would not know her as his little friend of long ago, and yet how it pained her to be unrecognized. That was why she never smiled.

The little maid opened the stained glass window so that the cool evening breezes might soothe Sir Compe in his sleep. Then she tiptoed off to bed.

Wednesday night. Hot roast beef and apple pie with ice cream piled atop of it, enough for twenty-four, yet no one came. Sir Compe could not eat. He whistled instead, but the tunes were slow and rather quavering.

Thursday night. Baked trout and lemon pudding, enough for half the city. Surely they must come tonight. The little maid who brought Sir Compe's portion at seven o'clock on a silver tray, hesitated and then turned back when she saw his face.

The ruler smiled wistfully when he saw that she understood.

"No, I cannot eat—not yet," he said. "Perhaps later in the evening numerous men of the city will drop in. Then the pages may serve us all together."

He did not say this confidently and the maid turned again to go. Sir Compe bent forward, staring with his blue, near sighted eyes.

"But stay, have I not known you before?"

The maid did not answer. "No, the face is the same yet different. The one I knew was always laughing. Some day, perhaps—"

He sat musing. The maid stood for a moment, a slender, black clad figure against the purple of the hangings. The ruler had forgotten her. He was polishing his spectacles and whistling

dearly. Lifting high the silver tray she passed quickly through the door. The next day was rainy. The maid

Oil Light Beats Electric or Gas Burns 94% Air

A new oil lamp that gives an amazingly brilliant, soft, white light, even better than gas or electricity, has been tested by the U. S. Government and 35 leading universities and found to be superior to 10 ordinary oil lamps. It burns without odor, smoke or noise—no pumping up, is simple, clean, safe. Burns 94% air and 6% common kerosene (coal-oil).

The inventor, V. S. Johnson, 31 N. Fifth St., Portland, Ore., is offering to send a lamp on 10 day's FREE trial, or even to give one FREE to the first user in each locality who will help him introduce it. Write him today for full particulars. Also ask him to explain how you can get the agency, and without experience or money make \$250 to \$500 per month.

THE POMONA Duplex Plunger Deep Well Pumps

are solving the Pumping problems for many users during the period of low water levels. They will lift the water to the surface, and, if desired, deliver it to high elevations above ground and at lower power cost than any other system of Pumping water.

Even If You Could "Coast" EVERYWHERE

In the Old "Bus"
It Would Cost You More
Than
Pacific Electric Fares

The Gas you burn is only a small item in your total cost of operation. Add to that the cost of oil, rubber, repairs and depreciation in the value of the machine, and see "where you are getting off."

The Government says it is costing you from 9c to 14c per mile.

You can ride the Pacific Electric way for 3c per mile for the occasional journey and for about 1½c per mile for the frequent (commutation) trips.

"CAN YOU BEAT IT?"
YOU CAN NOT!

Ask any Pacific Electric Agent for the Commutation Fare on tickets best adapted to your travel needs. He will show you the true way to travel economy, and you do not carry the accident risk.

hummed to herself as she dusted the piles of books in the attic, hummed gaily so that the pitter patter, drip, drip, drip, would not make her cry. She was sometimes very lonely.

There seemed to be thousands of books, histories and primers and atlases and stacks and stacks of albums. The maid guessed what numbers of forgotten photographs they must hold, but she had not time to look. There was one of red plush like people had on parlor tables long, long ago. The maid dusted it tenderly. Someone had prized it. Without thinking, she gave a little twist to the key in the album's lock and then from somewhere came the softest, sweetest strain of music in all the world.

Open fell the cover and there instead of pages of strange faces, lay the tiny springs and wheels of the music box. On and on tinkled the piece as the little spring unwound.

The maid clasped her hands and listened. She thought of Sir Compe. Tonight perhaps he would again sit alone, whistling drearly or turning the pages of a book he did not read. The forgotten music box might help him as it had her, for she had no thought of weeping now. The gentle music had been like a mother's hand stroking her hair.

Friday night. Baked little pig and apple sauce and sweet potatoes, but not so much of anything for the ruler had been afraid to order. At eight o'clock the great room had grown very dim and still Sir Compe was alone. At nine o'clock he bowed his head in the darkness. So his people did not care for him, did not understand that he wanted to help them. Why—why—

He heard a timid footstep in the darkness, then suddenly a strain of music, faint, mysterious, but oh so sweet! Sir Compe sat erect. His lips began to whistle the tune very gently. Then he hummed it. The old words came to him one by one:

"Mid pleasures and palaces though we may roam,
Be it ever so humble, there's no place like home!"

A charm from the skies seems to hallow us there,
Which, seek thro' the world, is ne'er met with elsewhere.

Home! home! sweet, sweet home!
There's no place like home, there's no place like home."

He saw the palace when his mother had lived, friendly ivy trailing over its dusty walls, geese and their babies waddling across the lawns, petals falling from the rose bowls in the dining hall, bits of sewing in the study. He saw suddenly all the cottages of his people and he knew that they were homes, that his people would not have them changed, that that was why they had not come.

The next morning Sir Compe arose early and hurried to the market place. A great and murmuring crowd had gathered and the ruler walked among them smiling.

"My friends, nothing shall be changed! Your homes are your own! Pardon me, I beg of you."

And now the people were shouting and tossing their hats into the air.

"Long live Sir Compe! Long stand our homes and his own!"

It was noon before Sir Compe was able to get away from his friends. He walked briskly toward the palace. He vaulted the picket fence and came to his kennels.

Open went the doors. Out trooped the dogs, sniffing, barking, frisking. Out came the ponies to the first terrace, kicking their little heels in the fresh air.

Sir Compe walked along, planning flower boxes for the palace windows. He stopped. Someone was leaning over the balcony. Someone was laughing delightedly and calling to two scrambling puppies.

Sir Compe looked up. The little maid looked down into his face. Her grey eyes were as bright as stars and her cheeks were rosy with laughter.

"You!" cried the ruler. "You are the one after all. My little Ardis!"

And every person in the city celebrated their wedding with rejoicing.

To keep macaroni from sticking together mix a little butter with macaroni after it has been boiled and drained.

Money may be saved by avoiding sure things.

HINTS FROM HOUSEKEEPERS

Almond Paste

I saw in this department some time ago a request for almond paste. I have recipe which is as good as any I know. Being an English recipe it may be difficult to get the bitter almonds which the recipe calls for. However, I will send it.

Pound together 6 ounces of blanched sweet almonds and 1 ounce of bitter almonds, 2 ounces confectioner's sugar, whites of 2 eggs.

This is the cake that the paste is usually used with:

Almond Simnel Cake—Beat together 6 ounces each of butter and sugar, add 4 eggs well beaten, 2 ounces rice flour, 6 ounces flour and 2 ounces mixed candied peel, cut very fine. Mix well and pour half the quantity into a round buttered cake tin, put in a half an inch layer of almond paste, then the remainder of the cake mixture. Bake in a moderate oven 40 minutes. Hoping this will assist you.—Mrs. S. G. Walsh.

Lemon Cheese

Here is a recipe which I find very useful to have made up, as a delicious cake can be made in a very short time with this filling on hand:

Six ounces butter, 12 ounces sugar, 3 eggs, 3 lemons. Put butter and sugar in a double boiler and when melted add the grated rind and juice of 3 lemons, then add the eggs (well beaten) to the mixture, and cook until thick, stirring all the time. This is delicious and will keep indefinitely if put in a Mason jar and sealed.—Mrs. S. G. Walsh.

HOUSEHOLD QUERIES

Omelet

I have been reading with interest your household department and wish to ask some of the kind readers to contribute some good recipes for omelet with directions.—Subscriber, Maxwell.

Plain Omelet.—Place 3 tablespoons shortening in frying pan and while heating place 3 eggs in bowl and add 1 tablespoon milk, 1 tablespoon water. Beat with fork to thoroughly mix and, then, when pan is smoking hot, turn in the mixture. Then place where omelet will cook very slowly. Season, then fold, turning on hot platter.

Fluffy Omelet.—Separate yolks and whites of 3 eggs. Place yolks in bowl and add 3 tablespoons milk and beat to thoroughly mix. Then beat whites very stiff. Cut and fold yolks into the prepared whites and then turn into pan and cook slowly. Fold, roll and turn on hot platter. This may be garnished with ham, bacon, parsley, pimientos and green peppers, jelly, grated cheese, etc. Cook as for plain omelet and just before turning add desired flavoring. Have filling heated (except jelly) before spreading on omelet. Leftover vegetables and bits of meat may be used in this manner for attractive dishes.

Spanish Omelet.—Chop fine 2 medium sized tomatoes, drain free from moisture and add 1 medium sized onion and 4 large olives chopped fine. Place in small pan with 1 tablespoon butter to heat. When hot spread over omelet, fold and serve on hot platter or slip in oven to brown.

Sunshine Cake—Potato Cake

I would like for you to publish in household department a recipe for a sunshine cake as I have misplaced mine. I remember that the sugar was boiled with water and poured over the beaten whites of the eggs, and that it took seven eggs, but I don't remember the amount of flour and water or sugar. It surely was a splendid cake. Also would like a recipe for potato cake. I certainly do appreciate the Cultivator recipes very much.—Subscriber, Santa Maria.

We have not this particular recipe, but give the following. Perhaps some of our housekeepers can supply the one requested:

Sunshine Cake.—Beat whites of 10 eggs till stiff and dry, add 1½ cups powdered sugar gradually, and continue beating; then add yolks of 6 eggs beaten until thick and lemon colored, and 1 teaspoon lemon extract. Cut and fold in 1 cup flour mixed and sifted with 1 teaspoon cream of tartar. Bake 50 minutes in moderate oven in angel cake pan.

WESTERN CANADA Land of Prosperity

offers to home seekers opportunities that cannot be secured elsewhere. The thousands of farmers from the United States who have accepted Canada's generous offer to settle on FREE homesteads or buy farm land in her provinces have been well repaid by bountiful crops. There is still available on easy terms

Fertile Land at \$15 to \$30 an Acre

—land similar to that which through many years has yielded from 20 to 45 bushels of wheat to the acre—oats, barley and flax also in great abundance, while raising horses, cattle, sheep and hogs is equally profitable. Hundreds of farmers in western Canada have raised crops in a single season worth more than the whole cost of their land. With such success comes prosperity, independence, good homes and all the comforts and conveniences which make life worth living.

Farm Gardens, Poultry, Dairying are sources of income second only to grain growing and stock raising. Attractive climate, good neighbors, churches, schools, good markets, railroad facilities, rural telephone, etc.

For illustrated literature, maps, description of farm opportunities in Manitoba, Saskatchewan, Alberta and British Columbia, reduced railway rates, etc., write

Questions and Answers

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Poinsettias.

I would like information regarding the care of the poinsettia. We do not raise them around Fresno, so know little of their culture. When the bloom fades what pruning is necessary? Does the plant remain green and in foliage all year? Would appreciate any information you can give.—“A Sun Maid” Subscriber, Fresno.

The poinsettia will never succeed to its best in the San Joaquin Valley. It is almost a tropical plant and likes more moisture in the atmosphere than the valley can supply. In sheltered sections near the ocean, especially in San Diego and possibly as far north as Santa Barbara, it grows exceptionally well. The principal supply for Christmas trade comes, we believe, from San Diego County. It is possible the plant could be kept alive in Fresno by building a shelter, but where the oleander is supreme as it is in Fresno far more satisfaction can be secured in growing a plant of that type which is adapted to conditions. Plants are deciduous.

Bichloride for Tools.

Will you please publish a good method of disinfecting the tools used in pruning blighted trees?—Subscriber, Turlock.

The usual formula for solution for disinfecting tools used in pruning for pear blight is bichloride of mercury and water, 1 to 1,000.

Poinsettias Drop Leaves.

Can you tell me why the leaves of poinsettias turn yellow and drop off? Is it the nature of the plant, or does the soil need something?—Subscriber, Sebastopol.

We fear the weather conditions have not been favorable to poinsettias. They are purely tropical plants and unless grown in greenhouse or thoroughly protected do not think highest success could be had with them in your section. They are deciduous.

Curing Olives.

I am much interested in the subject of pickling green and ripe olives for home use. I have read your various articles in California Cultivator and have no doubt the directions you print are the right ones; but, with a special reference to the pickling of ripe olives, would you be so good as to inform me if it would be safe to omit from these the sterilization by heat and depend upon their keeping fit through the lye and salt process alone? I have in the past used both the green and ripe fruit without sterilizing but, in view of somewhat recent cases of poisoning, I feel that it would be safer to know if there is really any risk in omitting the sterilizing. I can't help but think that takes away some of the crisp, fruity condition of the olive cured with lye and salt alone.—Subscriber, Los Gatos.

In view of the fact that the state board of health has ruled that “It is possible that bulk non-sterilized olives may carry the bacillus,” the Cultivator has no advice to give. But the writer will say that having eaten home cured olives treated only with lye, pure water and brine over a period covering more than a third of a century, and not being dead yet, he will continue eating with relish olives cured in that way. The ruling of the board is working a great injustice on growers of olives who wish to cure and sell a portion of their product. Of course the ruling does not affect the olive grower who may cure and eat as he pleases.

Non-bearing Apple Tree.

I have an apple tree 11 years old that never bears any fruit. It has no disease whatever. What is the cause?—Subscriber, Lancaster.

This is probably a case of barrenness which can only be corrected by grafting tree over to a desirable variety. Grafting of the apple is so simple and almost sure that anyone who understands grafting at all can easily make over the tree. Find desirable variety known to bear well in the same community, use scions say three to five inches long, use the ordinary cleft graft, tie and thoroughly wax. This done, say in February or March, or a short time before the spring flow of sap begins, will probably result in fine producing tree within two or three years.

Distance for Walnuts.

I am more particularly interested in walnut growing, and have already set out about 60 trees on this place, which have made a good showing during last year, in fact, after being cut back at the time of planting some of them are seven feet tall at the present moment! I was about to order more trees when, happening to see something from the pen of Mr. Neff in your issue, I decided to stop until I had settled an important point, and it is this matter that I wish to have your expert advice upon. I planted the walnut trees 50 feet apart, which I thought would give the trees a fair chance to do their best, but I see that Mr. Neff says in no uncertain manner that 50 feet is not enough; they must be placed 60 feet apart! Of course, in years to come the trees may grow big enough to require this 60 feet, but I am thinking of something which concerns me now in the immediate present. If I plant the trees at 60 foot centers I will lose five trees to the acre; I have only a limited area available, about another 13 acres or so, which means that I will be shy a matter of 65 trees. Sixty-five bearing walnut trees seem a lot to sacrifice for a number of years before they get big enough to fill a 60-foot square, so I am asking you if 50 foot planting is not enough for practical purposes. That distance is recommended by reputable nurseries. I understand that the walnut tree doesn't like to be crowded and cannot be expected to do its best under a handicap of that character, but since I want to make the most of my available ground I would like to get some expert counsel about it. Another point I wish to bring before you is this. The trees are planted in a canyon bottom; the soil is a layer of loose sand and silt overlying loam, and the subsoil is always damp from the underground seepage down the canyon. We have had no rain here for over two months and yet the soil three or four feet down is quite damp, and there is about 30 feet of such soil for the walnut roots to get into. Naturally such conditions have made my trees grow very well. Some of them send up long shoots, seemingly at the expense of the other branches. Shall I nip off the tops of these long shoots so that the tree may develop more evenly or leave them alone? In these cases there are four or five short shoots beside the extremely long growth, and I want the trees to develop evenly.—Subscriber, Riverside.

This question is so fully discussed on another page of this issue by Mr. Neff that we refer to that article, which, while very short, gives the gist of walnut planting practice. As may be noted, Mr. Neff still believes in the 60-foot distance. The loss of the use of the land while the trees are young may be eliminated by intersetting quick maturing trees or annual crops.

Thornless Blackberry

I would like to get some information on the thornless blackberry. Are there any commercial growers of this blackberry in California?—Subscriber, Chandler, Arizona.

At the present time the Cory Thornless is one of the most popular berries planted in California. Plants may be had of nurserymen advertising in the Cultivator.

Cypress Seed

Under what conditions of soil and climate may the seeds of the common cypress be germinated and grown. I do not have any luck with them.—Subscriber, Etiwanda.

Your failure may be due to age of seeds and lack of moisture. It is good practice to soak cypress seeds in water for 24 hours before sowing, and this will be particularly efficacious if seeds are old. A subsequent equal moisture supply is needed so that fine sand or leaf mold, preferably both, in the soil will prove conducive to a good percentage of germination.

Pruning Cornichon

What is the best way to prune Cornichon, Emperor and Verdel grape?—Subscriber, Morgan Hill.

The three varieties of grapes mentioned will produce well by using the spur method of pruning, although recently growers are using somewhat longer spurs, particularly on the Emperor. This has been termed the half-long system. Horizontal cordon pruning may be practiced also and provided this system is understood and care exercised to keep the vines pruned as they should be.—F. K. H.

Pruning Mulberry

I have a mulberry tree that is over 12 years old. It has a tendency to spread over 20 feet. Should it be pruned very much back to keep it from having too much of a crown?—Subscriber, Morgan Hill.

You can probably keep your mulberry tree in bounds by cutting the long limbs back to a smaller lateral. This operation will, of course, have to be repeated every few years. Be sure to make the cuts clean, thus giving the wounds opportunity to heal properly. (Continued on Page 23.)

Walrath, El Centro; 67-68, Warne & Sons, Holtville.

M. L. Pontoni, grade Jerseys—Klamath, 810 lbs. milk, 55.89 lbs. fat.

H. F. Richards, Jerseys—Victor's Lady Queen II, 856 lbs. milk, 55.31 lbs. fat; Teddy R's Silver B., 731, 50.14.

The reports for November so far received show that 282 cows in milk during the full month produced an average of 716 lbs. milk and 35.44 lbs. butter fat (average number of days in milk at the beginning of the month, 230). The highest producing cow for the month was a pure bred Holstein, Lady Lilith Walker De Kol, owned by Anita M. Baldwin (2116 lbs. milk, 53.58 lbs. butter fat) at 165 days from freshening. Eight cows produced between 60 and 70 lbs. fat during the month.

The prize offered by the California Cultivator for the highest average production by five grades for the month of November, was won by W. F. Early of Grizzly Bluff, Humboldt County. The average production of the five highest grades eligible to compete for this prize was 48.72 lbs. butter fat during the month (average milk 660 lbs., test 7.38%; average distance from freshening, 245 days). The production of the individual cows ranged from 40.2 to 57.8 lbs. butter fat. These cows stood first among similar groups of five grades in 15 dairy herds in different parts of the state that competed for the Cultivator prize the past month. The average production of butter fat for five of the groups came above 40 lbs. during the month, viz., W. F. Early, 48.72 lbs.; M. L. Pontoni, 47.93 lbs.; Peter Iversen, 47.79 lbs.; J. A. Genzoli, 46.90 lbs.; F. F. Pellissier, 43.50 lbs.

The following cows completed the record period of ten months (305 days) in the competition during the past month. They are given in the order of their owners, alphabetically arranged, except for the record cow for the month, which is placed first:

HOG AUCTION SALE DATES

Hog auctions of the California Farm Bureau Marketing Association at Wasco, January 7; Tulare, 10; Visalia, 11; Hanford, 12; Corcoran, 13; Merced, 17; Turlock, 18; Madera, 19; Fresno,

20; Bakersfield, 21; Tulare, 24; Visalia, 25; Hanford, 26; McFarland, 27.

Packers claim sales have improved quality of hogs 100 per cent in the San Joaquin Valley. The association sells only for members of the farm bureaus. Notify sales manager of your consignment five days before sale. Hogs should be in corral before 10 o'clock on day of sale.

Local managers: Stanislaus County, W. J. Norton, Modesto; Merced County, Geo. H. Knott, Merced; Madera County, Henry Webb, Madera, and F. R. Powell, Chowchilla; Fresno County, J. A. Poytress, Fresno; Kings County, L. C. Trehwitt, Hanford; Tulare County, D. H. Scott, Visalia, and Allan Thompson, Tulare; Kern County, H. H. Fowler, Wasco, and T. M. Calvert, McFarland.

BULL BARGAINS

We offer a limited number of high record registered Holstein bulls of excellent type and popular breeding. They are

—Ready for heavy service.

—Out of dams with 700 to over 1,000 pounds butter in one year.

—By sires whose dams have yearly records up to 31,000 and 33,000 pounds milk and up to 1,200 and over 1,300 pounds butter.

There are only a few on hand and at the prices we have placed on them they will soon be gone. If you can't visit our herd, write or wire for description and prices.

THE J. S. GIBSON CO.

One Cause for High Cost of Living

By J. C. Sherer

As from time to time in your excellent publication I note articles on the high cost of living, any one of which sets forth clearly at least one of the causes, please permit me to make a contribution from personal experience.

Some months ago I had a fat cow to sell, an animal that had been brought up "in the family" as it were since calfhood, and had never to my knowledge had a day's illness. I called up one of the big packing houses on the telephone and asked what they were paying for fat cows and was told that the price was from five to seven cents live weight, but that payment could not be made until the animal had been killed and "inspected." I agreed to the terms and sent the cow to the packing house on a truck. The driver brought back to me the weighing receipt showing that the animal weighed 1,200 pounds. Two or three days later I received a check with statement showing that it was for "1,200 pounds at one cent a pound (condemned), \$12; and hide, 40 pounds, at 35 cents, \$14," making a total of \$26 for the animal that I reasonably expected would net me about \$75. I am giving the price of the hide

per pound from memory and may be in error there, but the total for the hide was as stated. I went to the packing house to investigate and was courteously received and shown from one person to another but was unable to see the inspector, who was absent. I did, however, see his report for the day the animal was killed. It showed that on that date there had been three animals condemned in the establishment, two for tuberculosis and one for pyorrhea, only that and nothing more, no identifying description of any kind.

Then I wrote to the inspector and received a reply from him stating that on the date named there had been three animals condemned, but that none of them was tagged and therefore he could give no particulars. This ended my investigation as I saw no encouragement in continued efforts to get satisfaction. Now I am not saying that the animal I sold was in perfect health; but all outward evidence pointed to that conclusion. She had been tuberculin tested a short time before. But I do not believe the animal was diseased, and if in this particular case I was not swindled, it was

not because it would have been difficult for the inspector and the packing company to have got away with it. It is disgraceful that the United States government should maintain a system of inspection that provides no protection to the seiler of livestock while making it easy for dishonest inspectors and packing house managers to rob the producer by the use of means which the government seems to have provided them.

And while on the subject allow me to give another instance from personal experience. About the time that the Cudahy Packing Company began business in Los Angeles, some 25 or 30 years ago, I sold to Sam Maier on Spring Street, in that city, a hog for which he paid me at the rate of seven cents a pound live weight. In 1912 I sold to the packing company a hog similar in size and quality and received seven and a half cents live weight, an advance of half a cent per pound in a period during which the retail price of pork had doubled.

Facts of this character go far towards explaining why the consumer, even before the war upset values, was paying too much for many articles of daily use. There is no longer any inducement for the raising of livestock on the small farm with the market hedged round with all sorts of devices to make it difficult for the producer to get a fair price for his product, or in other words, to get a square deal.

OBSTRUCTION IN TEAT

There have been many queries as to garget conditions, inflammation of udder, obstruction in teat, etc., so we quote three paragraphs touching upon the latter from "Diseases of Cattle."

Blocked by Concretion of Casein

Under unhealthy conditions of the gland or milk ducts clots of casein form which, pressed clear of most of their liquid and rolled into rounded masses, may block the passage. They can be moved up and down by manipulation of the teat, and if they cannot be pressed out they may be extracted by using the spring teat dilator, being held surrounded by its three limbs. Before extraction is attempted an ounce of almond oil, boiled, should be injected into the teat.

Blocked by Calculus

When the calcareous matter of the milk has been precipitated in the form of a smooth, rounded stone, a rough, conglomerated concretion, or a fine, sandlike debris, it may cause obstruction and irritation. These bodies are felt to be much harder than those formed by casein, and the milk usually contains gritty particles. Extraction may be attempted, in the case of the finely divided gritty matter, by simply milking or with the spring dilator in the case of the larger masses. Should this fail the teat may be laid open with the knife and sewed up again or closed with colloidion, but such an operation is best deferred until the cow is dry.

Blocked by Growth

In this case the obstruction may be near the orifice of the teat or farther up, and the solid mass is not movable up and down with the same freedom as are concretions and calculi. The movement is limited by the elasticity of the inner membrane of the teat from which it grows, and is somewhat freer in certain cases because the growth has become loose and hangs by a narrow neck. In the case of the looser growths they may be snared by a fine spring wire passed as a loop through a fine tube (like a teat tube open at each end) and introduced into the teat. When this cannot be done, the only resort is to cut in and excise it while the cow is dry.

Livestock News Notes

V. F. Dolcini, June Acres Stock Farm, Davis, has announced a public sale of Duroc-Jersey bred sows and gilts to be held at Davis, February 9, the day following the association sale. Dolcini will offer at that time about 35 head and will feature the get of his herd boar, Choice Wonder 3d, grand champion at the 1920 state fair, part of which will carry the service of his son of Pathfinder.

The annual sale of the California Duroc-Jersey Breeders' Association will be held at the university farm, Davis, February 8. The offering will be made up of high class consignments from the leading herds of the state and will afford California farmers an exceptional opportunity to enter the hog business at a time that was never more favorable.

The first Duroc-Jersey sale of the 1922 season has been scheduled by Witherow and Stafford, Green Wood Farm, Live Oak. The sale will be held at the farm on January 26. The owners of this herd are recognized as among the most conservative swine breeders in this state and it is a foregone conclusion that they will present an offering that will represent most dependable Durocs.

R. C. Sturgeon, Tulare, recently sold sixteen registered Holstein heifers to T. B. Pearson of the same place. Many of these are daughters of Segis Pontiac Abbecker, a 35 pound son of Segis Pontiac De Kol Burke. Following the sale of the heifers Mr. Sturgeon sold to H. G. Ball, Tulare, the outstanding young sire, King Tola Korndyke Pontiac, who is by King Korndyke Pontiac 20th and out of K. P. Tola, the noted 36 pound daughter of King of the Pontiacs. Mr. Sturgeon states that he intends always to have a registered Holstein or two around, but that his duties as vice president of Farmers State Bank absorb so much of his time that he felt

Increased Milk Production —and a better grade of milk

MORE and richer milk is well worth trying for. It means more money on the profit side of dairying. And it is far from being just a dream. In every herd there are certain cows that are not yielding up to capacity, just because of some reduced vitality of genital or digestive organs—some sluggish condition of the milk-making organism that proper medicinal aid would quickly correct.

It is just such conditions—very common to hard-worked milch cows—that Kow-Kare is able to clear up; because this famous cow medicine has properties that act directly on the organs of production and reproduction, making them function as Nature intended. Besides effectively preventing the ailments that make cows unprofitable, Kow-Kare has a nation-wide reputation as a reliable remedy in the treatment of Barrenness, Abortion, Retained Afterbirth, Scouring, Bunches, Milk Fever, Loss of Appetite, etc.

Play safe; know what to do when a cow is sick. Send for our free book on cow ailments, "The Home Cow Doctor." It tells the right treatment for various ailments, and has a wealth of information valuable to cow owners.

Kow-Kare is sold by general stores, feed dealers and druggists, at the new reduced prices—65c and \$1.25.

DAIRY ASSOCIATION CO., INC.
Lyndonville, Vt.

"Penny-a-Day Prevention"

The cheapest health insurance you can invest in is to use Kow-Kare regularly a part of every week during the winter to keep the assimilation and digestion in good order and throw off disease. Many of the most serious disorders that arise during calving period can be prevented by using Kow-Kare for a couple of weeks before and after. Don't overlook this suggestion.

cently been completed in the big herd of registered Holsteins owned by Frank M. Helm, Fresno. Leila Korn-dyke Hengerveld made 29.53 pounds butter from 515 pounds milk, increasing her former record of 27.05 pounds butter in seven days made as a senior three year old. Helm Lady Fayne Mead, a first calf daughter of King Hiske Mead, made 22.76 pounds butter from 420.6 pounds milk in seven days. Helm Pontiac Walker, a first calf daughter of Prince Juliana De Kol Walker, made 22.96 pounds butter from 410.7 pounds milk in seven days. The full age cow, Kathrina De Kol 3d, has in her first seven days 25.48 pounds butter from 529.8 pounds milk. There are close to 40 head of promising females moving up toward the test barn for the first season of official testing in this herd, and Herdsman Harry Redd will have his hands full from now on as a large number will be continued on yearly test.

Acting for Max Mamlock, who recently purchased the herd of registered Holsteins owned by E. A. Gammon, Hood, V. P. Snow recently purchased a high class young herd sire from Fred W. Kiesel, Sacramento, owner of Jane Garden Farm. This young sire, Jane Garden Orlando Korndyke, is sired by the famous Sir Aaggie De Kol Acme, son of the world's official yearly butter producer, Aaggie Acme of Riverside 2nd, and is out of Helen Nye Skylark, that made 28.02 pounds butter in seven days as a senior three year old, and was one of California's choicest individuals. Her sire, Buffalo Skylark Ames, was junior champion at 1909 National Dairy Show, and is by a half brother to the sire of Spring Brook Bess Burke 2nd, one of the breed's outstanding yearly producers and foundation dams. The price of \$2500 paid for this youngster places him among the California price leaders for the 1921 season.

When W. J. Higdon, Tulare, sold off all of his mature registered Holsteins at public sale in May, 1920, he established a new high average for an individual breeder's sale in California, his 50 head averaging right at \$1000 per head. It was an outstanding offering of females headed by King Korndyke Pontiac 20th, who sold for \$12,000 in the same sale. The prices give some indication of the quality of the females and the herd sire, and when the sale was over Mr. Higdon had left as the nucleus for another herd about 25 daughters of King Korndyke Pontiac 20th out of the great cows that he sold. These are just now coming into milk, and Mr. Higdon is himself back on the job milking the ones he now has on official test. Among the first to finish seven day records as two year olds are Pearl Segis Burke Pontiac, that made 19.78 pounds butter from 429.8 pounds milk; Miss Heringa Pontiac that made 17.05 pounds butter from 388.1 pounds milk; and Lady Pontiac Holingen Jewel 2nd, that made 17.19 pounds butter from 349.3 pounds milk. A remarkable thing about the last named heifer is that she came in with two blind quarters and made her record out of half an udder, milking as high as 56 pounds in one day. Another daughter of King Korndyke Pontiac 20th, the heifer Korndyke Creamcup, purchased by Mr. Higdon in the last guaranty sale, is making an excellent yearly record. She has now been in milk nine months as a junior two year old and has made right at 70 pounds butter each month for the past two months and is now milking 60 pounds per day. None of these heifers were highly fitted or crowded as they will all be continued on yearly test.

Louise Alcartra Prilly, a junior two year old daughter of the four times grand champion bull, King Segis Alcartra Prilly, has just completed a record of 23,100 pounds milk from 865.02 pounds butter in the Bridgford Holstein Co. herd at Patterson. Several of her first calf half sisters are on the way to large yearly records, among them being Bessie Veeman Alcartra Prilly, that promises to annex the senior two year old yearly milk record by a wide margin.

(Compiled from U. S. Government statistics)

Look at this diagram!

It shows just how profitable the production of butter or butter-fat has been since 1914, and that it pays just as big today as ever.

The top line of the black area shows the price of butter, while the bottom line shows the cost of feed required to produce a pound of butter. The thickness of the black area then shows the spread between cost of feed and price of butter—or the net profit. For example, near the end of 1921, feed to produce a pound of butter cost 16.9 cents; butter sold for 45.7, leaving a difference of 28.8 cents per pound, or 170% profit.

De Laval Cream Separators have helped more than any other factor to put the butter business on such a profitable basis—by saving cream, improving butter in quality, saving time, and saving skim-milk in the best condition for feeding.

Let a De Laval start making and saving money for you now. See your De Laval agent or write for full information. Prices on pre-war basis. Sold on easy terms.

TURKEYS

TURKEY EGGS

To prospective turkey raisers for 1922 we wish to announce we are in the field again this year with the best bunch of breeding stock we have ever had. Comprising 150 fine Mammoth Bronze hens and 12 Toms (¾ wild); will furnish you all the eggs you want after March 1st at 25 cents each. We have a new mating system and will give a written money back guarantee of 90% fertility. A deposit of 5 cents per egg must accompany your order. We are booking orders now and thank you in advance for your patronage. If interested preserve this ad—this is all we are going to say about it. C. P. Emerson, Gardena, California. Phone 469.

Turkeys—Purebred Giant Bronze, male and female stock, sired by our two famous toms, "Goldbank Boy," champion Giant Bronze first prize winning cockerel at Madison Square Garden Show, New York, January, 1921, and "Copper King Jr.," a 36-lb. yearling son of "Copper King V.," the 38-lb. yearling that was grand champion at Madison Square Garden Show, January, 1919, both bred to choice 20-lb. hens. Eggs in season. Address Bronze King Mountain Farm, Calistoga, Cal.

It's no wonder so many poultry raisers make a failure of the business. Without any knowledge of raising poultry people will branch out expecting to make a success. By putting in practice the valuable contents of POULTRY FOR PROFIT, \$1.00 postpaid, success is assured in the poultry business. Cultivator Publishing Company, Los Angeles, California.

Mammoth Bronze Turkeys—Stafford strain Eastern stock, beautiful plumage, extra large frame and bone. Money back guarantee. Send for circular. R. M. Dodge & Son, R. D. 2, Box 129, Bakersfield, California.

HOUSEHOLD QUERIES

(Continued from Page 13.)

Irish Potato Cake.—Cream 1 cup butter with 2 cups sugar, add 1-3 cup sweet milk, 4 well beaten eggs, ½ cup cocoa, 2 cups flour sifted with 2 teaspoons baking powder, 1 cup mashed potatoes seasoned as for table use, 1 cup walnut meats slightly salted, 1 teaspoon vanilla extract and ½ teaspoon cinnamon. Mix in order given and bake in loaf or layers. Ice with caramel icing.

Caramel Icing.—Two cups brown sugar, ½ cup sweet milk, ½ cup butter. Boil 5 minutes; remove from fire and beat until creamy. Flavor with vanilla.

Doughnuts

Wish you would kindly publish a recipe in the household column for making good doughnuts.—Subscriber, Livermore.

We are sending this inquirer copy of Cultivator of March 26, 1921, containing six recipes for raised doughnuts sent in by our household readers. We print two other good ones:

Crullers.—Take 2 eggs, 2 small cups white sugar, pinch salt and 4 tablespoons melted lard; beat all well together. Stir into 1 pint buttermilk 1 heaping teaspoon soda until it foams; mix all together with sufficient flour to make a soft dough. Work out flat with palms of hands, cut into shapes and fry in hot lard. Roll into a mixture of powdered sugar. These crullers will melt in the mouth if not mixed too stiff in kneading.

Mashed Potato Doughnuts.—Four large potatoes mashed fine, 2 cups soft white sugar, 3 eggs, 2 tablespoons butter, heaping; 1 cup sweet milk, pinch salt, 4 teaspoons baking powder. Add sufficient flour to knead stiff. Roll very thin and bake quickly in hot fat. These cakes puff up very light and soft.

POTATO PANCAKES

Cook 3 large potatoes, peel and mash fine. Measure and place 2 cups mashed potatoes in mixing bowl and add 2 cups flour, 1 teaspoon salt, 4 teaspoons baking powder, 1 egg, 4 tablespoons milk. Mix to smooth dough, roll out ½ inch thick; cut and brush tops with milk. Bake in hot oven 18 minutes.

FEDERATION OF CALIFORNIA LIVESTOCK MEN UNDER WAY

A need has long been felt for an organization to coordinate the forces of all classes of livestock owners in California, and a movement toward that end is now under way. At a meeting of representative livestock men at University Farm, Davis, on December 30, in connection with plans for the annual Stockmen's Week in February, the idea of such an organization was suggested by Frank N. Bullard, one of California's most constructive breeders and a member of the firm of Bullard Bros., Woodland, whose Ram-bouillets are world famous. The idea met with ready approval and a committee of seven was named to perfect the preliminary details of organization.

The committee consists of C. L. Hughes, Sacramento, chairman; Frank N. Bullard, Woodland; Wm. Briggs, Dixon; J. I. Thompson, Davis; Thornton S. Glide, Davis; Frank L. Morris, Woodland; C. B. Cunningham, Mills. The organization of the various livestock interests into one central body makes admission of the fact that the livestock owners of California heretofore have not been in position to act in unison and with force in matters affecting their interests, a condition which the federated body will hope to correct.

HEREFORD ASSOCIATION SALE FEBRUARY 21

Plans for Stockmen's Week at the University Farm, Davis, are nearing completion, and in the assignment of dates for various events the regular semi-annual sale of registered Herefords by members of Pacific Coast Hereford Cattle Breeders' Association was set for 1 p. m. Tuesday, February 21. This sale will inaugurate the selling of registered beef bulls in California in lots to suit carload buyers, and the consigning breeders will attempt to present a class of bulls suitable for range service as the bulk of the offering, while a number of herd heading caliber will also be included. There will also be around 25 registered cows and heifers in the sale list. California Breeders' Sales and Pedigree Company, which will manage the sale, reports that 12 representative breeders have already offered a total of 51 bulls and 22 females. Entries for the sale will close promptly on January 10, and not more than 15 head above the number already offered can be accepted.

LIVESTOCK NEWS NOTES

(Continued from Page 17.)

Bridgford Holstein Company, Patterson, has added another to California's list of 1,000 pound cows, Netherland Pontiac of Greenbank having finished a 365 day record with 1,016.2 pounds butter from 24,425 pounds of milk as a five year old. She is sired by King Pontiac Pieterje Pontiac, twin brother to King Korndyke Pontiac, former herd sire in Fred W. Kiesel's herd at Sacramento.

The seventh junior two year old daughter of the famous sire, Sir Ormsby Skylark, to make over 19 pounds butter in seven days recently completed her record at Maxwell Farms, Hollywood. This heifer, Miss Sunshine Ormsby Skylark, freshened at two years five months and made 23.10 pounds butter from 437.4 pounds milk in seven days. Manager Jack Klein calls attention to the fact that this is the second highest junior two year old record for a daughter of Sir Ormsby Skylark.

King Segis Alcartra Prilly, the four times grand champion bull owned by Bridgford Holstein Company, Patterson, is taking a new and more prominent position in the breed's limelight in California due to the remarkable official records his daughters are making in both short and long time tests. He celebrates the passing of 1921 by contributing a 31 pound daughter to the production lists, his first 30 pound heifer. This daughter, Jessie Fobes Segis Prilly, a second calf senior three year old, has just made 31.58 pounds butter from 466 pounds milk in seven days.

Several new official records have lately been made in the Frank M. Helm herd at Corcoran. Katrina De Kol 3d increased her previously noted record to 26.18 pounds butter from 577 pounds milk in seven days. Helm Lady De Kol Walker, a junior three year old daughter of Prince Juliana De Kol Walker, made 18.35 pounds butter from 390.9 pounds milk in seven days. Princess Pauline Beets, a full age daughter of Crown Prince Segis, made 22.32 pounds butter in seven days. Victory Lorna Korndyke, a senior two year old, made 19.52 pounds butter from 446 pounds milk. The last named heifer is by Sir Piebe De Kol Segis Pontiac, son of the noted King Segis Pontiac Count, and is out of Leila Korndyke Hengerveld, that recently made almost 30 pounds butter in seven days in the Helm herd.

Stifel's Indigo Cloth

Standard for over 75 years

No work that you farmers do is too rough for clothes made out of Stifel's Indigo Cloth.

All Overalls, Jumpers and Work Clothes made of this cloth last longer, wash better and keep their "looks."

Stop Hatching Weak Chicks

Chicks that hatch a few days mean

out weak and wobbly, and live but nothing to you but trouble and loss.

Queen Incubators

produce large hatches of strong, vigorous chicks that live and grow. The Queen is accurately regulated—taking care automatically without attention of a variation in temperature of 70 degrees without danger to the eggs. It is built of genuine Redwood—very scarce in these days of imitation. Redwood does not absorb the odor from hatching chicks. Cheaper woods and strawboard or composition lining in iron or tin machines, retain the odors, to weaken and kill the chicks of later hatches.

Queen Incubators and Brooders are sold by dealers everywhere. Send for Free Book.

QUEEN INCUBATOR CO. Lincoln, Nebraska

Baby Chicks

Place your order now for early spring chicks. We can ship any number. All popular varieties hatching each week. Complete line of supplies. Send for price list. All breeds of puppies, kittens, birds, pullets, pigeons, rabbits and pet stock.

Hen Mothers for Baby Turkeys

By Jean A. Koethen

ONE of the most hopeful signs of progress in the fight against blackhead, the great enemy of little turkeys, is the fact that so many breeders, large and small, acknowledge the magnitude of the problem and are systematically and persistently working toward its solution. To them the loss of a large per cent of their poults each season is neither an accident nor an untimely providence, but a challenge, and they are studying and experimenting to find the way out.

The names of several of these investigators have been mentioned here in past months and only a few weeks ago a Vacaville woman, who did not wish her name published, sent in the formula for a mash which she had found almost a solution of her problem. Another name, that of Mrs. Charles W. Young of Whittier, must be added to the list.

Hen Mothers Best

Mrs. Young hatches from 75 to 100 poults each spring and prefers chicken

from the time they are given to the hen. At first it is sprinkled on the ground, but as soon as they have learned to pick it up it is left before them in trays. Charcoal is sprinkled on the drinking water, but they have nothing else till the third day.

Hard boiled eggs, young onion tops and Carnation wheat flakes are the ingredients of the nursery feed. For one day's ration for 30 poults, four eggs are boiled and ground in the feed mill with an equal amount of onion tops and wheat flakes (one-third egg, one-third green and one-third cereal). Charcoal is mixed in while grinding and chick grit added after the mixture is ground.

The above mixture is fed five times a day on very clean boards, about half a teaspoon being allowed ten turkeys. The mother hen is always fed separately and never allowed to feed the poults. The amount is gradually and cautiously increased, but this rule of "little and often" is carefully followed the first month. The second month there are only four meals a day and thereafter only three.

POULTRYMAN'S CALENDAR—JANUARY, BEGINNING THE HATCH

February is the best hatching month in California, and eggs that are to hatch in February must be in the incubator or under the hen in January. The commercial poultryman has found that he saves time and money by buying his chicks ready hatched. The fancier, the farmer and the backlotter will hatch with hens or buy chicks. A few find it more convenient to use the small incubators, but these can only be used successfully in a cellar or a double walled building in which there is little change in temperature.

Coops and brooders should be in order with the beginning of the new year and cannot be too carefully cleansed and disinfected. Incubators should be disinfected after every hatch and sitting hens dusted to remove all lice. Put the hen in a quiet, well protected place and see that her nest is comfortable. Test eggs on seventh and fourteenth days and set no egg that is over ten days old.

hens to turkeys for mothers. If more convenient, the eggs are incubated by turkey hens, but when the turkeys hatch they are given to chicken hens to rear. Chicken hens, she says, are more attentive to the wants of their brood, more easily handled and quieter in confinement.

As soon as each poult is out of the shell it is dusted with sodium fluoride or buhach powder and placed in a warm basket to await the end of the hatch. When the mother hen is through hatching she is dusted well with buhach and allowed to run for a couple of hours and to eat her fill of corn or wheat. She is then placed in a lath coop two and a half feet square and high enough to permit her to stand comfortably, and given her brood of not more than ten or twelve poults. If a turkey hen has been used for hatching, two or more chicken hens were set at the same time, so that there are mothers for all and not too many to a hen.

The coop stands on cement floor in a small house which can be opened on two sides if the weather is pleasant and closed quite tightly if necessary. Clean straw covers the floor outside the coop, but under the coop it is covered with clean sand or gravel which is renewed daily.

After two or three days the coop is taken out each morning as soon as the dew is off the grass and placed in a large yard filled with growing melilotus. The hen stays in the coop ready to warm her brood if they are chilly, and they have the run of the yard. When the evening shadows begin to fall, coop and brood are returned to the house. When the poults are able to fly over the three foot fence which surrounds their yard they may run where they please.

The transition from being hovered to roosting is made very easy. The house is fitted with roosts which are put in before they are needed, and when the birds wish to roost, they roost, that is all. When the hen finds her charges roosting, she goes on the roost with them, and when they are three months old they leave the hen for the wire turkey house with its high roosts.

Feeding the Poults

Grit is before the little turkeys

After two weeks the boiled egg is gradually replaced by cottage cheese, and after the end of the sixth week sour milk is used instead of cottage cheese. About the beginning of the sixth week a little chick growing mash is added to the ration in place of part of the wheat flakes, and by the end of the eighth week the poults have been gradually worked off the nursery feed and onto a ration of growing mash diluted 50-50 with bran, with five per cent bone meal added, and whole wheat and rolled barley morning and night. As the poults grow older the bone meal is dropped and by the sixth month the ration is reduced to plain bran, whole wheat and rolled barley with as much green feed as is available.

Reliable Blue Flame Brooder

The leader of oil burning brooders. Easy to operate, economical, abundance of heat. Four sizes for flocks of 1 to 1000. We also have Queen coal burning brooders, electric and hot water systems. Baby chicks and pullets. Ask for 1922 general catalogue.

Sole Distributor for Northern California

Keep them Hungry

Overfeeding seems to be the predominant cause of the development of the blackhead germ in young stock, but it is not easy to know just when one is overfeeding. Mrs. Young not only keeps her little turkeys always eager for their meals, but she watches their crops as they eat. As soon as

any little crop begins to bulge that little turkey is removed and allowed to eat no more. This method gives each poult its chance and the more vigorous and greedy cannot stuff themselves while the weaker and slower ones go hungry.

In order that every bird shall have an equal chance at the feed hopper and that the feed shall always be absolutely clean, a slatted hopper is being designed for next season's use. This will be so arranged that the turkeys can reach the mash only from the side, and no turkey can monopolize more than one opening. In every flock there are turkeys that will "hog it all" if they can, but the slatted hopper keeps them under control.

Ipecac Treatment

The Drs. Wegeforth of San Diego announced their ipecac treatment of blackhead just in time to give Mrs. Young a chance to try it last spring. Seventeen turkeys that had already developed the disease were treated according to directions and ten recovered. Eight others were given preventive treatment and not one developed the disease.

SUCCESSFUL TREATMENT FOR CHICKEN POX

I have had so much benefit from the helps in the Cultivator from the various departments I can not refrain from offering my little mite if I can be of any help to the readers.

I want to tell what I did for my chickens that had the chicken pox, and they could not have been worse, as their heads were solid with thick scab when they were at the worst.

The first one, a little Seabright with little chicks, was bad before I discovered her. I put her in a pen to herself at first and gave her a teaspoon of oil and put permanganate of potash in the water she drank and mixed equal parts of kerosene and oil, rubbing it on her head several times a day, thoroughly soaking it. She could not see to eat and I was afraid she would starve, so I put her little chicks in with her and put the feed in a pie tin so that when they would eat the mother could hear them peck on the pan and she could find it. In that way I saved all that had the chicken pox.

Some just started a few white knots on the comb and I treated them the same and they developed no farther.

I used paraffine oil for the solution and also to give them. I hope if the readers try this they will be as successful as I was, for I never lost a chicken.—An Old Subscriber.

REPORT FOR 1920

The California state board of agriculture has completed and mailed its statistical report for the year 1920. The officers of the board are H. A. Jastro, president; T. H. Ramsay, vice-president; I. L. Borden, treasurer; Chas. W. Paine, secretary-treasurer; Fred W. Links, statistician. The first half of the book is given to general statistical report of the state's various productions while the latter part is given up to a summary of the agricultural resources by counties. A brief description of each county is given, followed by statistics. One of the most valuable features of the report is a folder map of the state of California.

WATER CONSERVATION POLICY ADOPTED

Among the most important actions by directors of the Los Angeles County farm bureau, December 15, was the adoption of the report of the water conservation committee to the effect that the farm bureau during the coming year urge investigation of every possibility of impounding run-off waters in the San Gabriel watershed. The committee urged request that the supervisors appropriate at least \$50,000 for investigation of dam sites and reservoir construction.

OILPULL TRACTOR

"The Cheapest Farm Power"

- ① Lowest Fuel Cost
- ② Lowest Upkeep Cost
- ③ Longest Life (10 years and more)
- ④ Reasonable Price

Why an OilPull Increases Farm Profits

Every farmer in the Imperial Valley should know that there are just four factors he must have in the tractor he buys to get cheapest power. These are (1) Low Fuel Expense. (2) Low Repair Expense. (3) Long Life. (4) Fair Price.

In the Rumely OilPull Tractor these Four Factors have been combined for the first time in any tractor. (1) An OilPull has held the World's Official Fuel Economy Records for 10 years. (2) Among many OilPulls of all ages the average yearly upkeep cost was found to be less than half the Government figures. (3) The average life of an OilPull is more than 10 years. (4) Rumely prices are very reasonable, and strictly in line with present economic conditions. Everything needed to make cheap power is here.

Triple Heat Control

OilPull records are due largely to TRIPLE HEAT CONTROL—a wonderful oil burning system that solves the problem of getting the power out of cheap kerosene and stove tops. It is the only system that uses oil in the cooling system instead of water. Absolutely controls motor temperatures. No freezing. No overheating.

Due to Triple Heat Control, the OilPull is the only tractor sold with a bona fide,

written guarantee to burn kerosene successfully at all loads and under all conditions, up to its full rated brake horse power.

Write for Free Book

Among the four sizes is an OilPull that will make a profit for you. Complete details and special book on Triple Heat Control sent upon request.

Rhubarb: Best, 1.00@1.10.

Squash: Banana, lb., 1 1/2.

Sweet anise: 60 doz.

Tomatoes: Market steady. Locals: No. 1, per lug, best, mostly 3.00; poorer, 2.00@2.50.

FRESH FRUITS

Apples: Demand and movement moderate, market steady. Locals: Romes and King Davids, 4@6; few best Delicious, 7@8 lb.; Jonathans, 7; B grade Delicious, 2.65@2.75; fy., 3.00@3.25 lb. Watsonville: Fancy, 3 1/2 and 4 tier, Bellefleur, 1.60@

1.75; poorer, 1.50; 4 1/2 tier, 1.40@1.50; B grade, 4 tier, 1.40@1.50; loose, per lb., 3 1/2@4 1/2. Idahos, Washingtons and Oregon: Jonathans, extra fancy medium to large sizes, 3.00@3.50; fancy, 2.85@3.00. Oregon: Spitzenburgs, medium to large, extra fancy, mostly 3.00@3.25; fancy, 2.75@3.00.
 Avocados: 50 lb.
 Cranberries: Market steady. Massachusetts: Late Howes, 25.00@27.00 bbl.; New Jersey, Late Howes, 25.00@28.00 bbl. Dates: Coachella, 25@26.
 Grapes: Demand moderate, market steady. Per lb.: Red Emperors, 6.50 per drum.
 Olives: Green, 4@5 1/2.
 Pears: Bartletts, 8@10; Winter Nells, 7.
 Persimmons: Lb., 10@15.
 Pineapples: 20@25 lb.

CITRUS FRUITS

Grapefruit: Market steady. Californias, northern: Packed, box, 3.00; small, 2.50; Imperial Valley, 4.25@5.00; Arizonas: Seedless, 3.75@4.75, according to size and quality.
 Lemons: Demand and movement slow, market steady. Locals: Special pack, mostly 3.50; market pack, 2.50@2.75; loose boxes, 1.20@1.50; poorer, 1.00.
 Oranges: Demand moderate, market steady. Navels, special brands, 150s-176s, mostly 5.50; 200s-216s, 4.75@5.00; choice, orchard run, 3.00@4.00; market pack, 3.00@4.50, according to size and quality; culls, field boxes, best, 2.00@2.50; poorer, 1.50. Tangerines: Demand and movement light; best, 7@8 lb.

HONEY

The general situation shows little change over that prevailing two weeks ago. Stocks continue to decrease and are much lighter than were those at the corresponding period last year. Demand is reported as light. Due to light supplies, the market, although quiet, has a healthy tone. Alfalfa honey is in heavier supply than white honey. Quotations per pound in carlots or less than carlot quantities, f. o. b. California points: White orange blossom, nominally 12@12 1/2; light amber, 11@12; light amber sage, 8 1/2; light amber alfalfa, 6 1/2@6 3/4. Growers are said to be asking 10@13 per pound for white orange blossom and 6 1/2@7 for light amber alfalfa. Beeswax is in fair local demand at present at 20@25, mostly 22 per lb. to the beekeepers by bee supply houses for use in making next season's foundations. Demand in the East is lacking, as imported wax offers too great competition.

HAY

Alfalfa Growers of California report: Country loadings of alfalfa hay during the past week were very light; arrivals in all markets showed severe shrinkage, thus bringing out the full effect of the long rainy spell by putting a stop to shipments of most growers.

There were 330 tons of grain and alfalfa hay received in the Los Angeles tracks the week ending December 31, with 190 tons held over.

Prevailing prices last week, delivered in the vicinity of Los Angeles:

No. 1 dairy alfalfa	25.00
Standard	20.00
Quotations by Nicholas-Loomis Company. Following are prices to growers f. o. b. Los Angeles in carload lots; handling and commission must be added to obtain retail prices on new hay:	
Tame Oats	22.00@28.00
Barley	18.00@24.00
Alfalfa, Rabbit	24.00@28.00
Alfalfa, No. 1 Dairy	20.00@22.00
Standard	16.00@18.00
Straw	10.00

Veterinary

Answers in this column by Dr. Wm. Petrie, 2714 South Harvard Blvd., Los Angeles, are without charge. For immediate mail answer remit \$1.00. In writing questions give full symptoms or particulars of injury of animal.

Loss of Cud

Have examined the cow losing the cud. The trouble is not with the teeth. The cud sits way back on the root of the tongue. Have pulled tongue out and examined it but find no sore. Was feeding some barley hay but have cut that out and am feeding only ground feed. Cow eats well and seems all right in other respects.—Subscriber, Newman.

If the cow eats well and seems all right how did you happen to find a cud in the mouth? Now you say you have cut out the barley hay and feed only ground feed. That will surely make the cow sick. She must have some kind of hay or fodder that will form a cud or she will not live long. If you can not get anything else give her the barley hay. Forget about the cud as long as she seems well and eats well.

Udder Trouble

Have a cow that is failing in her milk in one quarter. Is there anything that can be done to restore it to normal? This trouble appeared last year but is worse since she came fresh last time. She appears perfectly healthy in every other way.—Subscriber, San Gabriel.

When there is trouble with the udder we always advise giving salts in the feed. Mix three pounds of epsom salts with two pounds of common salt and a handful once a day. Every time you milk the cow spend ten or fifteen minutes rubbing that quarter and be sure to milk out every drop you can get. Just hand rubbing will often restore an udder to healthy action.

Calves Dying

Can you tell us what is wrong with our calves and what to do for them? They come from healthy cows that are well kept and well fed. The calves receive the mother's milk warm from the cow regularly but when they reach the age of three or four weeks they lose their appetite entirely and refuse to drink. They lose control of their hind quarters and can not stand and try to shake themselves. They linger this way for two or three weeks and die. Their pens are kept dry and clean with plenty of straw. We have not put one in same pen with sick one nor where a sick one has been nor fed them from the same bucket. We have lost eight in this way.—Subscriber, Watsonville.

You have used good judgment in caring for the calves. There must be something wrong with the milk or about the place that you have not found. It acts like a slow case of ptomaine poisoning. Dissolve four tablespoons of epsom salts and two tablespoons of common salt in a pint of cold water and put in clean bottle for future use. The next time a calf refuses its feed give half of the solution as a drench. In 24 hours, if you

think the calf needs it, give the other half. Please let us know what results you get.

Tumor in Cow's Teat

I have a cow that has had something wrong with one teat for about a month. A hard lump has formed about half an inch from the udder and with all I have done for it it has not disappeared. At first it was a hard ring around the teat and as that went down it left a lump inside which seemed to hurt when milking and made her kick. I put on hot lard and it improved a little, but now the duct is partly closed so she is hard to milk and it seems to hurt more again. What is the remedy?—Subscriber, Sisson.

Lumps such as you describe are often caused by a bruise. They form small tumors and sometimes close the teat. The only remedy we know of is to cut them out. This must be done by an experienced man. They have small instruments that they pass in through the opening in the teat and with that cut the tumor in pieces. After that it usually heals all right but sometimes it grows again and sometimes the operation sets up an inflammation of the quarter and makes things worse than before. These tumors are not nice things to have and are not satisfactory to treat.

Abscess on Udder

We have a Jersey cow that is fed alfalfa hay and also has green alfalfa in pasture. We also feed her about one-third pail soaked beet pulp with a common coffee cup of cottonseed meal added. With this she got very fat. About two months ago a hard lump came in udder above first front teat. It was the size of two fists. We poulticed it about two weeks and finally had a veterinarian open it and a lot of pus came out. We took good care of it and it healed all right. Now we notice another lump coming just above where the first one was and some larger. When the first lump appeared we reduced the feed to one-half beet pulp and cottonseed meal. Do you think she is overfed? We have had the veterinarian several times to see her but he does not say what causes the trouble. What would you recommend?—Subscriber, El Centro.

We do not think the cow is overfed. It is hard to say what causes the abscesses. One might suspect tuberculosis, and the fact of her getting fat might add to the suspicion because cattle when first taken with tuberculosis often gain flesh for a while. You cannot do much more for the abscesses than you are doing. Would advise having her tested for tuberculosis by the state.

QUESTIONS AND ANSWERS

(Continued from Page 14.)

erly. The larger cuts should be protected with white lead or asphaltum paint.—F. K. H.

Fertilizer—Cover Crop

Can you tell me if Mexican red beans would be good to raise in young vineyard for fertilizer? Also if Mococo would be good fertilizer for my orange trees.—Subscriber, Exeter.

There are perhaps some districts where Mexican red beans will be successful as a cover crop. This can be determined only by the amount of green tonnage which can be turned under. If they grow well in your district during the winter you can profitably use them. If not, then use some other legume which has proven a success. Mococo fertilizer is good for use when superphosphates are needed. This material is, of course, not a complete fertilizer and would not produce results on soils requiring nitrogen or potash to balance the fertilizer for the crop. In its place, however, Mococo brand superphosphate will give good results.—F. K. H.

Breeding Doe

How soon may goat be bred after kidding? Also how long before kidding should milking be discontinued?—Subscriber, Mountainview.

It is usually possible to breed a doe from seven to nine days after kidding. It is not considered best for a doe, however, to allow her to kid more than once a year. Milking should be dis-

continued six or eight weeks before kidding time if it is possible to do so.—G. B. H.

Stringy Milk

Would like to add to the answers to "Bitter Milk" and "Foul Milk" in "Questions and Answers" in California Cultivator of December 10, that generally a cow will eat something that is not fed to her. Chicken droppings and hog droppings about a coral or pasture will be picked up by a cow and will cause bitter or foul milk, also impure water or unclean drinking vessels. One should watch a cow closely for a day to see what she is eating. Some weeds or plants will also cause the same trouble. Perhaps the above will help those troubled in this way.—Frank Littig.

We may also add the following taken from "Diseases of Cattle," a publication issued by the department of agriculture:

"This may be caused by fungi developing in the liquid, and that the spores are present in the system of the cow may be safely inferred from the fact that in a large herd two or three cows only will yield such milk at a time, and that after a run of 10 days or a fortnight they will recover and others will be attacked. I have found that such affected cows had the temperature raised one or two degrees above the others. Like most other fungi this does not grow out into filaments within the body of the cow, but in five or six hours after milking the surface layers are found to be one dense network of filaments. If a needle is dipped in this and lifted the liquid is drawn out into a long thread. In one case which I investigated near Ithaca, New York, the contamination was manifestly from a spring which oozed out of a bank of black muck soil and stood in pools, mixed with the dejections of the animals. Inoculation of pure milk with the water as it flowed out of this bank developed in it the fungus and the stringy characters. By fencing the spring in and giving the affected cows each two drams bisulphite of soda daily, the trouble was arrested promptly and permanently."

CARELESSNESS CAUSES TROUBLE AND ACCIDENTS

It is difficult to understand why a man will spend several hundred dollars for a tractor or some other machine and then, through sheer carelessness and indifference, proceed to run it without oil, cooling water, or with parts loose or out of adjustment, when he must realize that such treatment will cause damage, if not utter ruin. Yet there are hundreds of cases where this very thing happens. In fact it seems to be almost an exception to find a tractor which is given first class care in all respects, says Tractor Farming.

A factory expert recently spent two days in visiting the tractors which his company had sold in a certain locality. There was a large number of these machines in use on farms in the neighborhood and he went from farm to farm in an automobile, inspecting approximately 30 machines in the two days. The machines in question were equipped with an air cleaner which was designed to remove dirt from the air by passing the air through water. The instruction book which went with each tractor, as well as instructions printed on the air cleaner itself, stated very plainly that the water reservoir in the cleaner should be kept filled with water. Yet among all the machines which the expert visited in two days he found only one which had water in the air cleaner.

This is just one of the many examples which might be cited to show how the average tractor operator neglects his machine. And it is safe to say that a little later on when the pistons, rings and cylinder walls of those tractors are badly worn because of the dust which has been taken in through the air cleaners with dry reservoirs, the owners will lay a large share of the blame on the manufacturers, just as frequently happens when the wrong kind of oil has been used or an engine has been overheated because the operator neglected to keep water in the cooling system.

TRAVELING REPAIR SHOP FOR TRACTORS

It is easy enough to get an automobile into the garage but it is not always so easy to bring the tractor round when repairs on it are necessary. For this reason it is altogether possible that the tractor repair plant of the future will be a portable one, and indeed some such have already been built and are in use. In some respects they are similar to the portable repair outfits used by the artillery during the war. They are equipped with a full set of metal working tools, a small forge, and some even have an electric welding outfit. The current for the welding is generated by an electric machine which derives its power from the engine of the vehicle which furnishes the motive power.

With a machine of this kind farmers will have at their beck and call a ready repair outfit which will handle anything in the way of repair jobs on farm machinery.

PRICE CATALOG

Leonard Coates Nursery Company of Morganhill is mailing out price catalog of convenient pocket size of fruits which have been tested and tried on the grounds of the company at Morganhill. Of course the leader of this company is still the Coates No. 1418 prune. The effective illustration on the cover indicates the actual size of that fine fruit.

TWENTY-NINTH ANNUAL

The Aggeler & Musser Seed Company, Los Angeles, is mailing its twenty-ninth annual catalog. It takes literally tons of paper to produce this 116 page book. Catalogs have been going out from the print shop at the rate of a wagonload a day. Mr. Musser is an authority on the subjects he has so ably handled in this book which farmers, growers of vegetables, fruits, flowers, grains, grasses, poultry, hogs and stock will welcome as a valuable addition to the reference library. Twenty-nine years in the seed business have given this firm a wonderful insight into conditions in Southern California, and this experience and knowledge are the basis of the catalog.

Motor Troubles Ended

New Invention Creates Wonderful Spark—Doubles Power, Makes Winter Starting Easy, Stops Oil Pumping, Eliminates Carbon, Saves Gas—Free Trial Offer

Any car owner who is bothered with a motor which pumps oil, fouls spark plugs, wastes gas or carbonizes badly can stop these troubles by using a remarkable device called Warren Transformers, perfected by W. H. Warren, a Kansas City motor expert.

In two minutes a boy can attach Warren Transformers. Then you will be amazed to see your car go whizzing up hills on high where you formerly had to shift gears. You will also notice a big increase in mileage and instant starting in coldest weather. Spark plugs that formerly fouled and cylinders that pumped oil will be clean and dry and fire with full power.

If you want to save 25 per cent to 50 per cent on fuel and repair bills, be rid of missing cylinders, dirty plugs and carbon, have a quick start in coldest weather and pep on hills, write the Warren Mfg. Co., 203 Gateway Station, Kansas City, Mo., and a set of Warren Transformers will be sent immediately, with the understanding that they do not cost you a cent if not entirely satisfactory.

So confident is the Warren Mfg. Co. that Warren Transformers will more than delight you that they offer to send a \$4 set for only \$2. This is a special introductory offer, good only for a few days, and readers should take advantage of it immediately.

Send no money with your order—just your name and address, name of car and number of cylinders. Warren Transformers will be sent immediately.

When they arrive merely pay the postman \$2 and postage. Use them 10 days. If not satisfactory return and your money will be refunded. Write today and end your motor troubles. This offer is fully guaranteed.—Advertisement.

Interplant the Young Orchard

Make money while you wait for the trees to bear. I did it. Ask me about it. See my orchard.

Three-Wheeled Economy

Hundreds of farmers have found a Harley-Davidson and side car a vital piece of farm equipment that pays big dividends on the investment. For economy of gasoline, oil and tires—for downright year 'round dependability on all kinds of roads—for speed and convenience in making hurry-up trips to town or neighboring farm, you can't beat a Harley-Davidson.

Speed, convenience, ease of handling, low upkeep and durability—you get them all in the Harley-Davidson. Make it your partner, and in a week you'll say it's the handiest rig on the farm.

Fifty miles for a dollar—gas, oil and tires—is mighty cheap transportation. Ask your dealer for demonstration, or write us for free illustrated literature and reduced prices (average of 25 per cent reduction on all models).

BOLTON ORCHARD HEATER

The U. S. Department of Agriculture estimates the annual loss by frost at \$75,000,000. It may hit you next. The Bolton Orchard Heater

Prevents Frost Damage

Safest and surest frost prevention method known. Coal and wood heaters take too long to generate required heat. The Bolton beats Jack Frost to it, generates heat rapidly, maintains the temperature above the freezing point. This is important.

Send for Booklet P-2

Tells you all about frost prevention. Filled with valuable information for the grower.

"Tests on Oldsmar Heater show 100% Efficiency."—Prof. Peeples of Armour Institute

Frost Insurance at Minimum Cost

You insure your house, why not your crop? Fruit growers everywhere can have assured crop protection through the use of this improved and efficient heater which has a number of notable advantages over any other kind.

Oldsmar Frost Protector Costs Less To Operate

Five gallons of distillate fuel oil burns 10 to 15 hours according to temperature desired.

All cast iron (stack excepted), the Oldsmar is waterproof and cannot get out of order. Lighted instantly, it requires little attention and temperature regulation is positive.

An Oldsmar costs less than other cast iron heaters, lasts longer, requires fewer to the acre; affords complete protection—California and Florida grove owners and truck farmers are ordering them by thousands.

Write today for literature and full information about how the Oldsmar can protect your crop

TEAGUE QUALITY TREES

CITRUS and TROPICAL

Make productive and profitable orchards. Our many satisfied customers will tell you that it pays to buy Teague Trees.

The supply of good citrus trees for 1922 is somewhat limited, so place your order early and get the best.

Our field grown avocados are the best that can be produced. We have all of the recommended varieties. Ask for our latest price list. It's free.

Our new book on Citrus and Tropical Fruit culture fully describes varieties and gives cultural directions for the planting and care of the orchard. Price 50c.

EDITORIALETTES

Since the organization of the fig growers the industry promises great development. California has the only commercial fig orchards of importance in the United States. The fig is grown in many of the southeastern states but only in an experimental or home orchard way. The growth of the industry has been all too slow, but we believe within the next few years the increase will be vastly greater.

Oroville is anticipating material increase in prosperity because of organization of new irrigation districts. The latest one contemplates bringing under the water at least 20,000 additional acres, and the reclamation work will cost approximately a million dollars. Two other districts of comparatively recent formation have brought 30,000 acres under more intensive cultivation in what is known as the Oroville-Wyandotte district and 32,000 acres in the Honcut-Yuba district.

"Faith, friendliness and gumption are three American farm products on which the market never slumps." That's why California cooperators have succeeded.

Many chambers of commerce and too many of the newspapers of California are conducting campaigns against the power act to be voted on next November. Perhaps it's all too long a subject to take up completely so far in advance, still we are aware that many farmers are asking: "Why this opposition to a measure which offers relief from excessive power rates?" There are several others who are also wondering why.

AGRICULTURAL CONFERENCE

Secretary of Agriculture Wallace has called the National Agricultural Conference which was requested by President Harding to convene in the city of Washington, January 23. The majority of those who have been invited to attend are farmers or leaders in farm cooperative effort. There will also be representatives of industries depending on agriculture, and especially friends of the federal farm loan. California delegates who have been elected and accepted are Dr. W. H. Walker of Willows, representing the farm bureau, and G. Harold Powell of the Fruit Exchange.

BUILD STRONGER

We need longer lived highways. The base should be thicker; the reinforcing more general and, if possible, the width greater. This because of the destruction from overloaded trucks. Then is it not more reasonable to put into effect certain control measures as to weight of load on these trucks? The Berkeley Gazette has stated:

"There is not a highway in the United States today that will stand up under truck traffic. No one has yet discovered how to build one that will and, even did we know, the cost would probably be prohibitive at present. We do not know that roads which cost \$50,000 a mile will stand up under the pounding."

If we start in to build roads which will stand up under this terrific pounding we will go bankrupt, and perhaps accomplish little. We should have a campaign of education in the matter of proper use of our highways.

WASTED FERTILIZERS

It has been stated that millions in value of fertilizer is wasted annually in the state of California because of the application of those fertilizers on lands where the soil is in such condition that the tree cannot take up the plant food. Time was when we felt that the application of a chemical, or possibly of three chemicals, would result in greatly increased production. But, as has often been stated in the Cultivator, greater fertility is the result of soil building rather than of the simple application of chemicals. If the physical condition of soil is at fault, whether because of too much or too little water, lack of humus or vegetable matter which permits of more complete bacterial action, or if the soil is too cold or too warm, all the chemicals we may see fit to apply will fail to function. A pound of organic matter in the soil increases its water holding capacity seven or eight pounds. This is a point for the irrigator, as well as the one who would apply fertilizers, to consider.

Don't doctor the soil; build it.

COLORADO COMMISSION

The first conference of the Colorado River commissioners has been called by Secretary of Commerce Hoover in Washington, January 26-28. Secretary Hoover hopes "that this con-

ference will outline plans for development of the greatest irrigation and power project ever yet undertaken." It is estimated that the ultimate expenditure in this great scheme will be in excess of \$600,000,000. There is a possible 6,000,000 electric horsepower development, and the ultimate bringing under the water of a total of more than 5,000,000 acres of land. This all within the seven states of the Southwest. Secretary Hoover says: "Our first step will be the collecting of data. After that is gathered we will go forward." The secretary will be in California making investigations early in February.

Commissioners appointed are State Engineers McClure, California; James G. Scrugham, Nevada; R. V. Caldwell, Utah, and Frank C. Emerson, Wyoming; Water Commissioner W. S. Norviel, Arizona; Attorney Delph Carpenter, Colorado, and Stephen B. Davis, Utah.

MORE COOPERATION

Nearly two score mutual fire insurance associations held their annual meetings last Monday. California has a most excellent enactment which permits the association of home owners with each other to guarantee protection against loss by fire. Some of these associations have been in existence nearly a quarter of a century and have saved hundreds of thousands in the cost of insurance. The companies are organized without capital other than that of integrity and the cooperative spirit of the members. Premiums are about half those of the "old line" companies. In most of the companies this amount has been sufficient to gradually create a reserve fund and in the eyes of some increase their security. In the eyes of others the best security on earth is the integrity and cooperative spirit.

One of the best features of these cooperative insurance associations is the encouragement given to fire prevention campaigns. Actual ownership in the company which is protecting the home owner encourages a greater public spirit and determination to protect more fully one's own. We believe these insurance companies might well enter more actively into the educational side of fire prevention campaigns.

AGRICULTURAL BLOC

Now the agricultural bloc is going to get its turn in the limelight. It's about the first time the farmer ever had a chance in a large legislative way, and no sooner does he begin to accomplish something in the matter of legislation, especially legislation which gives him a fighting chance, than all the country holds up its hands in horror because of class legislation. Washington dispatches announce: "President Harding today in a conference with Senators Capper of Kansas, Kellogg of Minnesota, and Kenyon of Iowa opposed having his hands tied by the bill now pending before the senate requiring the president to put a farmer on the federal reserve board. Senators Capper and Kenyon are prominent members of the agricultural bloc, and Senator Kellogg, though not identified with the bloc, has taken an active interest in various agricultural measures and has been urging legislation to put a farmer on the reserve board."

Other dispatches say: "The president, it was said by bloc members, stated he desired in every way to promote the interests of the farmers but that the pending legislation would tie

the hands of the executive with respect to appointments."

Many statesmen, more politicians, are looking with great disfavor on this so-called class effort. It is so entirely unheard of that the farmers should cooperate and stick together in the effort and secure simple justice for themselves that the politicians are finding willing ears as they raise the shout of "class legislation." There has certainly been no injustice done by anything accomplished by the bloc so far. We are glad to give this week a statement made by Senator Arthur Capper in The Forum. This article gives fullest particulars as to the activities of the bloc and of the handicap under which the farmers have labored in their scattered effort to prevent middlemen and others from dominating in tariff and other legislation.

FLOOD CONTROL

The recent storm proved several things. One of the most striking was the efficacy of flood control. The heaviest precipitation in the entire state was in the Sierra Madre. Four canyons draining those mountains in northern and eastern Los Angeles County are Arroyo Seco, San Gabriel, San Dimas, San Antonio. The Arroyo Seco was the scene of devastation a few years ago at the time of a similar flood. Nearly a score of houses within the city limits of Los Angeles were torn to pieces and washed down the stream. The devastation of that flood called for action and flood control measures. A dam was built at Devil's Gate a few miles north and west of Pasadena. It was sufficient to hold the waters pouring out of the canyon during the entire storm, and the damage from the floods was nil. As the storm ended the gates were opened and the waters allowed to escape.

The next canyon to the east, the San Gabriel, has as yet no control of its floods, and along the course of this stream bridges were washed out, much roadway destroyed and great damage visited on high priced orchard properties.

The next canyon, the San Dimas, like the Arroyo Seco, had been protected. There was no damage whatever.

San Antonio, with still greater watershed area, is not yet supplied with dams. It is, however, given a measure of protection by distribution of its waters over the coarse gravel beds of the great "fan" at the mouth of the canyon. People of Pomona and Ontario districts made preparation for handling the floods in these gravel beds, but the amount of water pouring out of the canyon was altogether too great to be handled effectively, hence much damage, especially in Pomona, whose streets were ankle deep.

The complete protection Arroyo Seco effected a saving sufficient to cover the entire cost of Devil's Gate dam. All who have interests in the path of floods from these canyons are free in their prediction that still greater efforts at flood control must be made—and immediately.

Only last week there was held in Los Angeles a conference called by Dr. Clements of the agricultural committee of the chamber of commerce, in which members of the farm bureau and others participated. At this conference it was urged that the Los Angeles County board of supervisors make an appropriation sufficient to cover surveys of the watershed in and above the San Gabriel canyon. There are known to be many sites suitable for storage and control. This survey will doubtless develop the fact that the cost of some of them will be great, but past events show that the cost of no-protection is greater. Without question the present season's flood will prove a good teacher.

One Dollar Yearly

Reasons for the Agricultural Bloc

By Hon. Arthur Capper in The Forum

CRITICISM of the so-called agricultural bloc in the present congress as a "class group" has come, so far as I have observed, from class groups who fear recognition of the primary national industry by the government. These men in congress, comprising about 100 in the house and some 22 in the senate, largely from the West and South, who know the needs of agriculture, are accused by representatives of other interests of seeking class legislation for the farm.

The legislation which the agricultural bloc supports as its contribution to the general welfare, however, speaks for itself. As one who has actively supported and advocated these measures, I have no sympathy with class legislation, and I need hardly say that I see nothing of the evils of class legislation in the agricultural program.

Base of All Industry

It is trite to say that "agriculture is the basis of our prosperity." But threadbare as the statement is, it has needed repetition and emphasis. At the base of all industry is the oldest industry of the land itself. We may say that until quite recent years we regarded the farmer as valuable in his capacity as a producer of the first needs of life, but all great business now equally considers him as purchaser. He produces the raw material for the factory and he supports the factory in his immense consumption of finished products. Our entire business structure rests upon the land. The farmer not only feeds us and clothes us, but is, as a class, our best customer. Without him the railroads would languish. The steel industry without the railroad demand for rails and other materials, and the demand of the harvester and farm implement industries for steel, would perish. Unless the farmer prospers there can be no prosperity of a single industry. So efforts to improve and stabilize conditions surrounding this ultimate industry of food production are of as vital consequence to the city and to business in general as to the farmer himself.

Heretofore government aid to agriculture has consisted in the support of agricultural colleges and experiment stations, and the department of agriculture. Valuable as this service has been in promoting better farming, improved seed, soil culture and livestock, it has no relation to other and increasingly pressing problems of the farming industry which concern such subjects as financial credit and markets, and marketing machinery and processes.

Left by Wayside

Farming is a peculiar industry. It has not participated in the modern synthetical processes of industrialism, the centralization of control, the combination of capital into great units. In the immense development of the division of labor in the factory system and through the corporation, agriculture has been left by the wayside. It remains as individualistic as a century ago, when all industrialism was

individualistic. The farmer is the sole survivor of an earlier industrial order, when the shoemaker made shoes on his knees in his shop, when domestic industry flourished, and the household spun its own wool and was sufficient unto itself. With the development of the factory system and the corporation, and the corresponding evolution of credit and banking with relation to these new forms, agriculture has been overlooked. Farming is the only business left that buys at retail and sells at wholesale; that pays what is asked when it buys, and accepts what is offered when it sells. The farmer remains merely a producer of the necessities of human life. After he has produced them other organizations take them over at their own price for distribution. This is true of no other important industry. The producer gets only one-third of every dollar paid by the consumer for the products of the farm. Our expensive and antiquated marketing system takes the other two-thirds.

To Distribute our Products

The marketing and distributing agencies, well equipped with credit, closely affiliated and linked with the highly organized industrial order, do not, like the farmer, dump the farmer's products, after they have passed into their hands, at once upon a congested market. Facilities have grown up, the warehousing system, the elevator, the cold storage plant, the grain, cotton and other exchanges, that nicely adjust supply to demand, and the "middlemen" feed out the world's food supplies as demand calls for them. Just as these merchants hold and store and distribute in accordance with demand for consumption, thereby obtaining what the products are fairly worth during the entire year, so the farmer is now proposing through self-organization to dispose of his products, to control elevators, warehouses, credit, to be represented on exchanges, to market his own products. This is the first agricultural bloc aid to the farmer, in the Volstead-Capper bill authorizing farm cooperative marketing.

Farmers Handicapped

The farmer's individualistic industry, the single farm being the unit, not the corporate aggregation of many farms, is not adapted to the uses of the modern corporation. What is suited to agriculture (unless it is to be taken over bodily by big business in great trusts) is cooperation. There is not an economist nor an authority on agriculture who believes that the method of the corporation will answer the needs of agriculture. Cooperation differs from the corporation in several important features, but it is unnecessary to mention more than that in cooperation the amount of stock shall be limited to any one stockholder to the cooperative project, and the stock dividends shall be limited to a fixed rate having no relation to the earnings, as in the corporation, but having regard to the ruling rate

of interest for money or capital. Only by these limitations can the farm marketing enterprise be protected against control by a few, and the vital cooperative spirit maintained. In cooperation capital and labor are one. The farmer supplies the capital and it is he who turns out the product. The ultimate earnings dividends are rated not on the capital invested, but on the product contributed. This is true cooperation.

Middlemen Object

What the agricultural bloc discovered is that existing "middlemen" through their organizations are determined to prevent the rise of farm cooperative marketing. Aspiring local cooperative organizations of farmers were attacked by these interests in the courts for violation of the anti-trust acts, and the cooperation was obstructed and discouraged by these and other measures.

Convinced that farm cooperation is desirable, the last congress by an amendment of the federal trade act undertook to release it from any suspicion of attempted monopoly by exempting combinations "not for profit" from the scope of the anti-trust acts, acts designed for wholly different forms of organization. The amendment proved ineffective, and the Volstead-Capper bill now being pressed by the agricultural bloc, authorizes and validates farm cooperation as such.

Leads World Per Man

The American farmer leads the world in production per man, but he can never be an efficient salesman of his own products without the clear legal right to market them collectively. This right is given by the bill. Mr. J. D. Miller, representing the National Milk Producers, testified before a commission of congress that it "will do more for the ultimate prosperity of America's farmers than any other measure." This nation stands alone in the world in its inhibitions against farm marketing cooperation. The agricultural bloc is not asking special class legislation for the farmer, but merely the removal of legal obstructions to the farm cooperation and the placing of the American farmer on the same footing as his competitor in every other country on the globe. Danger of an agricultural monopoly through cooperation is not seriously urged, but only for political purposes by special interests. Agricultural monopoly through cooperation is impossible, because by the nature of the cooperative enterprise it has been found to be ineffective except by producers of the same products locally organized. Farm cooperation has not been successful either in Europe or in the United States where the members are widely scattered, or where they are engaged in the production of different products. A universal agricultural cooperative enterprise is utterly impracticable and contrary to all cooperative experience.

Cooperation the Remedy

But it is a sufficient defense of

farm marketing cooperation to say that every economist who has made a study of agricultural history and every advisor, from so high an authority as Secretary Hoover or Mr. Bernard Baruch down, agrees that cooperation is the remedy and the sole practical remedy for his marketing losses. In a recent interview Mr. Baruch said:

"I do not believe the farmer receives a fair share of the value of his products. And this is aggravated by practices of undergrading, overcharging for services, and under-payment. The theory of my belief is that the farmer should be put on an equal footing with the man who buys his products."

Mr. Hoover, in an address before the Kansas state board of agriculture on Farmers' Problems, stated that "our marketing system today in certain commodities is extravagant, it is wasteful, and it imposes great penalty upon the farmer." On the question of monopoly Mr. Hoover remarked in this address: "My own opinion is that price cannot be controlled in a long term of years by any form of organization. It can, however, be influenced toward the elimination of intermediate fluctuation, and speculation can be greatly eliminated."

Not Seeking Special Favors

In clearing the way for farm cooperation the agricultural bloc is not seeking to give a special advantage to the farmer over other industrialists, but to open the way for the farmer to adopt a plan of industrial organization as suited to the conditions of his industry as the corporation is suited to others. Other measures to which the so-called farm bloc has given its sanction include the Capper-Tincher anti-grain gambling bill already enacted into law. This is a measure, not for class legislation, but of correction of abuses on grain exchanges. It abolishes the practice of "puts" and "calls," condemned by grain exchanges themselves and many years ago prohibited by their own rules. But the main provisions of the bill give the secretary of agriculture power to investigate and report any suspected manipulation of the grain market, to check the books of market operators, and to prescribe rules for boards of trade. Other measures included are Senator Dial's anti-cotton gambling bill, bills regulating cold storage and providing control of the packing industry, the Capper-French truth in fabrics bill—applying to fabrics provisions similar to those of the pure food act—and bills creating more liberal banking credit, particularly personal credit on crops and farm machinery, making such paper more easily discountable.

Of these measures the only one susceptible to the accusation of "class legislation" is the last, since it does attempt to enlarge the banking credit of agriculture. People in cities or engaged in mercantile, manufacturing, brokerage or other business associated with cities are not aware of the extent to which bank credit has been evolved with relation to the needs specifically of such industries, and the extent to which the evolution of bank

(Continued on Page 34.)

Agricultural News Notes of the Pacific Coast

Northern California

Japan is importing rice from Northern California.

Napa County shipped 600 carloads of grapes last season.

Something over 16,000 cattle brands have been filed with the state.

The California Fruit Distributors announces 40,308 carloads of green deciduous fruits harvested the past season.

The California Asparagus Growers Association was organized at Walnut Grove recently.

The state laboratory opened at Sacramento January 1, under supervision of W. S. Wilkinson, Jr.

The supervisor of Lassen National forest reports 932 sheep killed by wild animals during the last year.

The James Mills orchards near Maxwell will furnish 60 carloads of oranges for shipment this month.

California's rice crop for 1921 amounted to 5,088,000 bushels, according to federal bureau of crop estimates.

The Vetch Growers' Association of Humboldt County is making arrangements for extensive plantings this spring.

Local meetings of Glenn County farm bureau: Willows, January 16; Capay, 18; Plaza, 20; Grapevine, 25; Glenn, 27.

Placer County fruit growers are urging establishment of a branch deciduous fruit experiment station in that county.

Twenty-one thousand pounds of Tehama County wool of the 1921 clip has just been sold at prices ranging from 19 to 30 cents.

During December cost of operation of Poultry Producers of Central California dropped to 2.92 per cent of sales, lowest of the year.

It is announced that work will soon be started on the poultry experiment station at Petaluma. It is to be under supervision of the state university.

The sale exchange of the Rice Growers Association opened January 5 at Sacramento. It will be open Tuesday, Wednesday and Thursday.

The Sutter County farm bureau is this year making distribution of purple vetch seed to members. The purple vetch has proven very satisfactory in that section.

Automobile transportation companies of California having gross operating revenue of more than \$20,000 must have a uniform system of accounts after January 1, according to an order made yesterday by the state railroad commission.

W. E. Rust, parasite collector for the California department of agriculture, who has been working in South Africa and Australia since July, 1919, reached San Francisco December 20. He brings with him valuable parasite material that will be reared and cared for at the department of agriculture insectaries.

The California Almond Growers Association has telegraphed the senate finance committee Prof. Jaffa's analysis of food values of California and imported almonds. This in protest against claim of the National Confectioners Association that California nuts are inferior, hence should not be given protective tariff.

Central California

Fresno supervisors have approved a number of road contracts.

Fresno County supervisors are considering truck load regulation.

A new Stanislaus County cow testing association is being organized.

The sixth annual fig institute was held at Fresno yesterday and today.

Reedley grammar school district in Fresno County has 1,122 children registered.

The Potato Growers Association of Shafter has bought \$35,000 worth of potato seed.

The California Fig Growers Association foresees a bright future for fresh fig shipping.

Fowler chamber of commerce, Fresno County, is to start a home building organization.

No farm home department meetings are planned by the Kern County farm bureau during this month.

Contracts have been given for the construction of three bridges on the Sanger-Centerville road, to cost \$4,420.

Sanger Citrus Association shipped 75 cars of navel oranges this season and the Stewart Fruit Company about the same.

P. G. Grundt of Wasco is chairman of the dairy department of the Kern County farm bureau. Mrs. Viola E. Rasmussen of Bakersfield is secretary.

Farm bureau meetings in Kern County: Mountain View, January 16; Pond, 18; Inyokern, 19; Rosedale, 20; Shafter, 23; Arvin, 27; directors at Bakersfield, 28.

The Santa Fe has taken over the operation of the railway line running from Bakersfield through Pentland, Maricopa, Taft and Fellows for a period of five years.

Farm bureau hog auction sales at Merced, January 17; Turlock, 18; Madera, 19; Fresno, 20; Bakersfield, 21; Tulare, 24; Visalia, 25; Hanford, 26; McFarland, 27.

The new citrus packing house at Sanger, Fresno County, has closed after putting out the 40 carload crop of the season. Lindsay, Porterville, and Exeter houses have also closed.

The California Peach and Fig Growers has employed a specialist to study causes and control of fig smut and report of his investigations was made at the institute just closed at Fresno.

The commission on agricultural education appointed by Governor Stephens will inspect the Kearney vineyard at Fresno, January 20. The commission will then visit southern agricultural schools.

As a Christmas present to the people of Tulare County, the new concrete highway into Globe from Porterville was opened the day before Christmas. Only a short distance now remains to complete the highway into Springville.

The 12 million dollar bond issue of the Merced irrigation district has been validated by the state irrigation bond commission. The proceeds of the issue will be expended in irrigating some 180 thousand acres in Merced County.

Senator Dennett spoke last week in favor of the proposed state water and power act before the Rotary Club at Porterville and the Terra Bella chamber of commerce. Senator Dennett is counsel for the Terra Bella irrigation district.

The Apple Growers association of Costa Mesa, Orange County, is now formally incorporated. First meeting will be held February 7.

The city of Anaheim and the Santa Fe cooperated in putting a big bunch of men at work with sand bags closing the gap in the Santa Ana.

Clam beds along the Santa Barbara coast have been raided by piggish diggers recently so that the game warden has had to be appealed to.

Many visitors have motored to the Devils Gate dam above Pasadena to see the great lake formed by impounded waters of the Arroyo Seco.

The state commission on agricultural education will visit Chaffey Junior College, Riverside citrus experiment station and the Meloland station.

Five demonstrations of correct methods of pruning one year grape vines were given in Imperial County the past week by Prof. F. T. Bioletti.

D. C. Milbrath, formerly specialist in plant disease at the United States station at Alhambra, has taken up work of the state department of agriculture.

The opening reunion for state societies for the season will be the Utah-Idaho rally in Sycamore Grove Park, Los Angeles, Saturday, January 14.

Orange vinegar is being manufactured at the San Dimas plant of the Exchange Orange Products Company. The finished product is ready for use within five days from extraction of juice.

Citrus shipments by the Placentia Mutual Orange Association for the fiscal year ending November 30 were 67 per cent greater than for the same period last year, according to Manager H. I. Easton.

Home department meetings of the Imperial County farm bureau at Jasper, January 17; Seeley, 18; North End Calipatria, 19; Mount Signal, 20; Westmoreland-Trifolium, 24; Magnolia-Mulberry, 26; Eastside-Sunset, 31.

Horticultural Commissioner Call of Ventura County in his report on biological control of the citrus mealy bug says that during the past month the citrus mealy bug has made a decided increase in the citrus orchards of this county. Nearly the entire time of one inspector has been devoted to the collection of food and the rearing of the natural enemies of this pest.

The Coast and General

Bitter Root Valley, Montana, shipped 700 carloads of apples the past season.

Orchardists of Washington are also beginning to appreciate the value of alfalfa as fertilizer.

Many farmers in the Silverton district of Oregon have set walnut trees in their home orchards.

Picking of olives, interrupted by the rains in the Salt River Valley of Arizona, has now been resumed.

Alfalfa is growing nicely in the Yuma section of Arizona where the ground is still too wet to work.

Sixteen carloads of hops were sent from Yakima, Washington, recently to England. Price around 30 cents.

Hop raising has almost been discontinued in Lewis County, Washington, only 257 acres being planted last season.

The Tillamook County Cow Testing Association will market calves from tested cows through County Agent W. D. Pine.

The directors of the Washington Holstein-Freisian Association met recently at Seattle to plan their activities for 1922.

Cotton picking has been much delayed in Arizona by the wet weather. Only about two per cent of the crop remains unpicked.

"A flock of chickens and a patch of berries is the best opportunity for the small farmer in this part of the county," says J. R. Stewart of Kirkland, Washington.

Farming operations in Arizona have been somewhat delayed by recent rains but on the whole benefit has accrued to crops, particularly to late planted lettuce, which has made considerable progress.

At the recent annual meeting of the Farmers Union of Washington and Northern Idaho J. I. Adams of Spokane was elected president to succeed W. J. Robinson, who has become manager of the Washington Wheat Growers Association.

The first dividends paid by the Lower Columbia Dairymen's Association gave shippers of butterfat two cents per pound above the Astoria market, four cents above Portland and six cents above Junction City. The association paid its patrons 49 cents.

Range steers in the White Mountain section of Arizona are still in fit condition for beef as ranges were covered with excellent pasture all autumn and the water supply adequate. Roads have not been damaged but will be too soft for auto travel for some weeks.

The Oregon Wool and Mohair Growers' Cooperative Association has changed its name to Pacific Cooperative Wool Growers, to include growers from Washington and California. It now has 1800 members. The association handled about 2,000,000 pounds of wool this season.

Range conditions in Arizona and New Mexico have been greatly improved by the heavy rain and snow, although a depth of from eight to 12 inches of snow in some portions of the north has interfered with the pasturing of stock. In the Flagstaff section an average of eight inches covers the ground while in the Grand Canyon section five inches of wet snow separates stock from feed.

The Bulk System of Grain Storage

By Arthur L. Dahl

THROUGHOUT the entire Pacific Coast the method in vogue for many years for handling grain is in the sack.

The cost of sacks, however, has been gradually increasing and during the war their price went way up, and as a result more thought has been given to the bulk handling of grain.

As one travels on the train through the great grain states of the Middle West there appear elevators of every description, some of them standing out like lighthouses in a sea of grain fields, while others are grouped at terminal points along the line. There are thousands scattered everywhere, many of them owned and operated by farmer associations and communities. Bulk handling of grain has been found to be the most efficient and economical system yet devised, and many of the largest milling companies of California are adopting the system, and even though the grain is received at the warehouse in sacks it is immediately emptied out and the grain merged with that from other sources and thereafter handled in bulk. The railroads make provision for bulk handling, furnishing proper cars and adjusting their tariff regulations accordingly.

Manufacturers of combined harvesters have developed their machines to permit of the handling of bulk grain from the time it is cut until loaded into wagons for hauling to the elevator, and the only thing necessary for the farmer to do is to provide the necessary storage facilities on the ranch to take care of the grain until it is sold and delivered to the purchaser.

Sacked grain, when stored in the open, or even under temporary shelter, is subject to many kinds of deterioration. Moisture is apt to be communicated to the contents in one way or another and rats and mice inflict serious damage to sacks in very short order. Insurance rates are so high that many farmers do not carry any in spite of the fact that their whole season's work is tied up in a stack of

grain that might be destroyed over night.

A practical solution of the storage problem is the maintenance of a metal storage bin on every grain farm. This bin occupies the same place toward grain that the silo does toward forage crops, and with a proper place to keep grain stored the producer can sell when and where he pleases.

The necessary equipment for the handling of grain in bulk can be purchased for a comparatively small amount of money, and the cost of this equipment will in most cases be returned in the form of savings in a few years. Farm wagons can be easily converted to carry bulk grain, and the purchase and handling of sacks be avoided.

Metal grain bins can be purchased in a size to meet the needs of the most modest ranch, or by combining a number of units the capacity of the largest grain field can be met. At numerous points on the Pacific Coast grain farmers have tried out the system of storing their grain in metal bins, and invariably they report after a year or two's trial that they would not go back to the sack method.

The Crocker-Huffman Land & Water Company purchased two 6,000 bushel metal bins which were installed on their ranch near Merced in 1918, and since that time these bins have effected great savings in handling and storing. Fire hazard is practically eliminated as well as damage by rodents.

Frank S. Reager of Orland reported that his metal grain bin effected a saving of more than \$600 in the handling of his 1919 crop. The harvesting was done more quickly and with less men and the bulk handling resulted in saving many bushels of grain that would have been lost through defective and torn bags, and once this grain was stored in the rat-proof bin it was safe until sold.

A metal bin 6 feet high and 12 feet 7 inches in diameter will store 600 bushels of grain, and by increasing the height and diameter the capacity is increased so that one 18 feet high and 22 feet in diameter will store about 6000 bushels of grain. By providing a proper foundation, and choosing a bin made from rust resistant material it will last indefinitely and will serve as a store room for corn or other crops if grain is not grown.

That the metal bin is an ideal type of storage for grain and other farm products is shown by the fact that many of the big commercial warehouses and milling companies are using the bins for the storage of their grain. In communities where farmers form cooperative elevator associations for handling their products the metal bins can be used to form units that can be expanded indefinitely to meet the increased needs of the members. In one such case a system has been worked out whereby a total storage capacity of 72,000 bushels can be obtained at one plant by the use of 12 bins, each of 6000 bushels capacity, arranging them in two parallel rows with each bin mounted on a conical reenforced concrete base. Each of the bins is connected with a conveyor system for handling the bulk grain, and an operator stationed in the tower over the workhouse regulates the delivery of the grain to any particular bin. Chutes lead from these bins to the workhouse so that grain cars can be loaded directly from the workhouse just as is done in the large commercial elevators. The grain is delivered at the plant by the farmers into a receiving pit below the level of their wagons, from which it is conveyed to the bins by mechanical elevators.

A metal grain bin on the farm will prove of value in many other ways, for it serves as excellent storage space

for all kinds of material. The bins are usually provided with ventilators at the top so that it is possible to regulate the temperature and humidity inside. Such a bin is excellent for storing seed corn or other seeds grown on the farm and kept over from one season to another. The absence of moisture, freedom from rats and other pests will permit the keeping of seeds so that their full germinating powers are not impaired, and where corn is kept for feeding to work animals it has been the experience of many farmers that animals will eat more of the corn kept in metal bins than in wooden corn cribs. Where the latter are used it is practically impossible to keep rats out and their running back and forth through the corn imparts an odor and taste that is disagreeable to stock. Where corn is kept in a metal crib or bin it is not subject to the changes in atmospheric moisture and it can be kept dry and wholesome for many months.

In modern agriculture the tendency has been toward making the farmer more independent and free from influences and conditions beyond his control. The tractor and other power machinery enables him to do more work himself and frees him from reliance on hired help. Improved farm implements enable him to plant, cultivate and harvest his crops in less time and with less labor than formerly, and the only thing needed to perfect their independent position is in the matter of storage for their products until a desirable market is found. When everybody is selling is not the time to sell, if one has the facilities to keep products free from deterioration until the demand is keener and prices higher. A metal grain bin installed as storage equipment on the farm will soon pay for itself in many ways, and such an investment will be another rung in the ladder on which a farmer can mount to prosperity and independence.

The Decline of Old Citrus Orchards

From Address by A. D. Shamel Before
State Fruit Growers

THE time is not far distant when the problem of the old orchard will be of much greater importance than it is now.

There are in California a few commercial orchards of Washington Navel, Valencia and Seedling orange, Eureka and Lisbon lemon and Marsh grapefruit varieties which are ordinarily called old orchards. I have also had the interesting experience of studying Navel orange orchards at Bahia, Brazil, where some of the trees are known to be about 100 years old. The ideas presented in this paper have been developed as a result of my studies and observations of tree conditions in these older orchards.

Vitality of Citrus Trees

The productive life of citrus trees has not been determined so far as I am aware. In Spain there are citrus trees more than 500 years old. At Bahia there are citrus trees producing satisfactory crops that are known to be about 100 years old. In California there are productive seedling orange trees that are known to be more than 50 years old. In Ventura County there are Eureka lemon trees in full production that are about 50 years old. In Santa Barbara, San Diego, Los Ange-

les, San Bernardino and Riverside Counties there are a few commercial orchards of some of the established citrus varieties in which the trees are from 30 to 45 years old. In some cases these trees are productive and vigorous.

The culture of citrus in California has not reached sufficient age to warrant definite conclusions as to length of time trees under favorable conditions may be expected to produce satisfactory crops. The decadence of individual trees or of orchards is dependent to such a great extent upon local environment that it is difficult to draw final conclusions. Furthermore, it is my opinion that the trees of different varieties possess characteristic constitutional vigor and that they may need particular care with regard to varietal considerations, such as the kind of root stocks, the type of pruning and the necessity for tree renewal, the location of the orchard and the cultural treatments which may be expected to prolong the life of the trees in a satisfactory condition of growth and production. Little is known about

these problems as yet. Until they are settled it will be impossible to state very definite opinions as to the ultimate length of productive life of citrus trees or varieties.

Causes of Decline

There are several known conditions which lead to the decadence of citrus trees in California. I will attempt to mention and discuss briefly only a few of those which have come to my attention while carrying on our bud selection studies during the last 12 years.

It seems definitely settled that the kind of root stock is related rather definitely to the health and vitality of citrus trees. I often think of the influence of the root stock upon the tree as somewhat comparable to the relation of the foundation to the stability of the building standing upon it. If the foundation is unsuitable or weak the building is likely to be short lived. Sufficient time has not elapsed to state finally the best kind of stocks for all varieties and under all conditions. The resistance of the sour stocks to diseases, including gummosis, which

has been definitely established by a study of the behavior of citrus trees grown on sour orange root stocks in some of our older citrus orchards, is an important consideration in this connection. Until some better kind of stock is introduced commercially it seems apparent that we should use for most conditions sour orange root stocks in propagation of the trees of all commercial citrus varieties for the Southwest.

The lack of satisfactory production in some of the older orchards has been found due to presence of trees of vegetative strains. Healthy trees of vegetative strains can usually be successfully top-worked with carefully selected buds. Vegetative branches can be cut out in otherwise satisfactory trees and through continuous pruning largely controlled. Unfavorable soil conditions are responsible for tree decadence in some of the older orchards, due in some instances to grading to level land for irrigation. By resurfacing such areas the unproductive trees have been brought back to profitable growth and production.

Where use of fertilizers containing injurious substances has developed unfavorable soil conditions their use should be discontinued and an effort

Aspinwall Potato Machinery

Prices Materially
Reduced for 1922

BUY THE ASPINWALL No. 3 Potato Planter

With or Without Fertilizer Attachment

The secret of the success of the ASPINWALL POTATO PLANTER is in the fact that it is AUTOMATIC, ECONOMICAL, EFFICIENT, and requires only ONE MAN TO OPERATE. It is the 100% planter—less labor, less time lost and less waste of seed. One man can plant from five to eight acres a day and PLANT THEM RIGHT.

The new 1922 prices on Aspinwall Potato Machinery permits you to buy the best at no more than cheaper, less reliable potato machinery.

The New Aspinwall No. 3, with or without the fertilizing attachment, is absolutely automatic, is free from trouble and positive in its planting.

The new price is so low that you can afford to replace your old planter with a new No. 3 Aspinwall. Write for folder and 1922 quotation.

Oliver riding two row cultivator does your cultivating, furrowing and hilling. We can supply your needs for other implements of standard quality at surprisingly low prices.

made to correct the unhealthy soil conditions. Where soil has become heavily charged with injurious substances or brought into poor physical condition by use of improper fertilizers or faulty irrigation water, there is doubt as to whether it can be brought back economically to a favorable condition for citrus culture. The best plan may be to remove the citrus trees and replant with some other crop.

Undesirable cultural practices or neglect frequently lead to decadence. Amongst the most common of the undesirable cultural practices may be mentioned the cultivation of the heavier soils too soon after irrigation or rainfall so that the soil becomes puddled and hard upon drying out. This interferes with the normal development of roots. Soil thrown up or washed up against the tree trunks is likely to be injurious. If such soil is continuously moist this frequently favors the development of serious citrus tree diseases. If the soil reaches above the bud union adventitious roots are likely to develop which seem to be particularly detrimental to the health, growth and fruitfulness of lemon trees. The liberal use of organic fertilizers, rich in humus and nitrogen, and thorough cultivation are now considered the most efficient means for improving soil conditions in orchards suffering from neglect.

Severe frost, heat and wind injuries without adequate tree protection and care have been known to lead to citrus tree decadence. The problem of frost protection is peculiar to the individual orchard. The damage from excessively high temperatures seems to be less in orchards where the trees are in good physical condition. Wind injuries can sometimes be avoided or minimized by suitable windbreaks. Lemon trees are not so resistant to extremely low temperatures as orange and grapefruit trees. A knowledge of the local climatic conditions through a study of climatological records and previous orchard history will often prove helpful in considering location of the orchard and the advisability of frost and wind protection.

Fungus diseases are important

causes of citrus tree decadence. Some of the commonly found fungus diseases can be controlled by systematic treatment. The development of some of the most injurious of these diseases is favored by unfavorable soil conditions. In these instances it is necessary to remove or correct the objectionable conditions as well as to treat the diseased trees. In other cases the diseases develop as a result of tree injuries such as those due to careless pruning or the reckless use of orchard implements. The treatment of such injuries when practicable is usually expensive and the necessity for it should be avoided wherever possible. In order to renew decadent citrus trees all scales and other insect enemies must be killed or controlled before good results from other care can be expected.

Rodents sometimes girdle or otherwise injure trunks and roots. In severely girdled trees inarching or bridge grafting can sometimes be successfully used. In all cases the wounded areas should be carefully treated, protected with a suitable covering such as grafting wax, and the tops cut back somewhat in proportion to the severity of the injuries.

The foregoing discussion is only a brief summary of some of my ideas as to the causes of citrus tree decadence. In this connection I would like to say that as the problem of the old orchard becomes more acute there is a tendency to attract the selfish interest of so-called tree doctors who advertise the cure of all tree ailments by mysterious or secret treatments. We have something of a parallel to this condition in the case of the human family. Physical ills are likely to develop which on account of our lack of knowledge may be difficult or impossible of cure. Here is the quack's opportunity. He blandly offers a free diagnosis and makes extravagant promises of a sure cure for all and every trouble. I would like to suggest that the grower beware of all extravagant claims for success in treating decadent citrus trees until local orchard experience has demonstrated the value of any particular treatment.

Bureau of Plant Industry

THE government's services to the plant life of the nation, during the past fiscal year, from its role as physician to ailing trees and cereals to the part it took in importing new and valuable species for ultimate use on American dining tables, is set forth in the annual report of the bureau of plant industry, United States department of agriculture.

As usual the bureau's activities during the year covered a wide range of scientific and practical work. From investigational work, with increasing corrective benefits in the wheat and corn fields of the country, the bureau extended its activities to a study of ailments affecting truck crops, grapes, oranges, lemons, pecans, figs, tobacco and other products in common use. Its work of this character in the orchards of the country resulted in valuable contributions to the knowledge of fruit tree enemies and diseases, and an extensive inquiry into troubles affecting the cotton crop was conducted; further work in combating the blister rust, which has played havoc in white pine forests of the New England and Lake states, was continued; the cause of the hardening of irrigated lands, which in some cases become so impermeable to water as to be unsuited for crop production, was determined and a preventive found; plant nutri-

tion and soil fertility investigations were continued; further progress was made in the identification and study of poisonous plants.

The widespread demand among individuals for information and plans with which to start grape growing was noted during the year. Two important new grape industries started during the year. The growing and curing of the currant grape and the growing and shipping of the Ohanez and other Mediterranean varieties in America owe their origin to the bureau's activities. Methods of pruning citrus trees and of growing prunes were studied, and valuable recommendations made. The apple, too, came in for study, especially its behavior during the various stages of evaporation. Fruit juices were studied and an investigation made of the troubles encountered by pecan growers.

Rubber can probably be produced in the United States, and a few native species of plants containing gums that can be used as rubber substitutes are worthy of thorough investigation.

In its study of diseases of fruit and nut trees the bureau reports continuation of the destructive inroads of pear blight; more prevalence than usual of peach yellows; and the severity of apple cedar rust, especially during the spring of 1921. Brown rot among plums and peaches, scald of apple,

Australian Brown Onions

pineapple diseases, and apple powdery mildew, were studied during the year with resultant acquisition of knowledge upon which to base campaigns against these plant diseases. The brown rot disease of prunes and cherries in the Pacific Northwest, the bureau reports, can be completely held in check by spray.

Among vegetables the bureau continued to fight against potato mosaic and leaf mold, potato tuber rots, sweet potato diseases, cucumber mosaic disease, nailhead spot among tomatoes, and onion diseases.

The campaign to eradicate citrus canker in the Gulf Coast territory west of Florida continued without abatement during the year. Renewed interest was awakened in the tangelo, a hybrid of tangerine and pomelo, which is found especially well adapted for the fancy fruit store and mail order demands. Why the flesh of this fruit dries out on maturity has been discovered, and suggestions for its prevention made.

Citrus canker has been practically eliminated from the Gulf states as the result of a vigorous campaign conducted in cooperation with the bureau.

Some of the most fertile irrigated lands of the West have become so hard after a few years of irrigation that cultivation has become increasingly difficult and in some instances the lands have become nonproductive. Into this situation the bureau has conducted an investigation, and has found that the hardening of the soil is due primarily to salts of soda, carried in irrigation water. "Indications are that it is possible to prevent the injury caused by the sodium salts," the bureau asserts, "through corrective applications of salts of calcium, iron, or other salts, and it may be found practicable to reclaim and bring into profitable production areas of land that have been abandoned because of injury from sodium salts."

FIG SMUT CONTROL

Report on investigations into control of fig smut was made at the fig institute held at Fresno yesterday and today, January 13 and 14. From the Lindsay Gazette we take the following. Report from the institute we hope to give in the Cultivator soon.

"The fig tree and fruit are often regarded as being 'fool proof,' able to grow anywhere and anyhow and not subject to many pests. Growers of figs have long since learned that some insects and diseases affect either tree or fruit and often cause serious damage. Among the fruit troubles, the disease known as fig smut has given more concern than any other, both in the field and packing house.

"This is a black fungus which invades the fruit and turns the interior into a mass of black powder. It is often difficult to detect from the outside and is therefore troublesome to packers who desire to put out a clean product.

"The California Peach and Fig Growers, after receiving the 1920 crop of figs on consignment perfected a machine which would tear open the individual figs sufficiently to enable girls to pick out the smutted specimens. Believing, however, that control in the orchard was the logical procedure, the board of directors authorized their horticulturist, Professor I. J. Condit, to employ a specialist in plant disease to make a thorough study of the smut and its life history and to work out practical methods of control. Miss Edith Phillips of Berkeley was therefore employed in December, 1921, and has spent all of her time in the field and laboratory working out the identity and the various stages of the smut fungus.

"The smut spores or seeds are very abundant in fig orchards and are blown about freely by the wind all winter, spring and summer. They are produced in stick-tight figs, in dead twigs, and in bark, and are undoubtedly present in the soil throughout most of the year. The spores are very minute and have no difficulty in getting into the eye of a fig with the aid of the wind. It is believed, however, that dried fruit beetles which are so numerous in fig orchards during the drying season, are largely responsible for spreading infection. Beetles which crawl into a smutty fig come out thoroughly covered with black spores and these are carried into both green and ripening figs. In some cases the smut fungus causes the fruit to rot with a characteristic pink discolora-

tion. In other cases the fungus grows and fruits on the inside of the fig and there is no indication of its presence from the outside except a slight darkening at the eye. While smut has been regarded as primarily a fig disease, similar if not identical smuts have been found on peaches, grapes, and in pomegranates, facts which complicate the situation and make control measures more difficult."

IMPROVED CROP REPORTING

One of the newer forces of value to producers, which has been introduced by the department of agriculture, is the crop reporting service. It has failed at many points; it has succeeded at others. Those in charge are determined to make it more complete and as nearly as possible perfect. Making address on the work of the service, Leon M. Estabrook asks suggestions from those connected with the service who know of deficiencies, and from all who are interested in marketing and know of marketing conditions. The service has tried every known method for estimating and arriving fairly accurately at crop and livestock production, but still wants other suggestions. Mr. Estabrook said:

"There is growing and insistent demand that the estimates be localized by counties. During the last three years the department has gradually extended its system to making

county estimates through its state statisticians. It is hoped now to publish maps for each state at or about harvest time, indicating surplus and deficient production by counties for each of the important crops.

"It is planned to issue figures showing the marketable surplus production, that part of the crop that is sold and actually leaves the farm and goes into the channels of trade. Up to the present time the department has simply estimated total farm production because of lack of funds except during the war period when emergency appropriations permitted estimates of commercial production of fruit and truck crops.

"Complete, accurate, and timely information with respect to livestock production is needed, perhaps, more than anything else," Mr. Estabrook said. "Additional funds would allow the department greatly to enlarge its livestock reporting service and to forecast the production of beef, hogs, lambs, wool and dairy and poultry products with the same frequency and degree of accuracy as the staple crops of the country are now estimated.

"An improved foreign information service is needed that will give timely, unbiased and dependable information at all times with respect to crop and livestock production, stocks on hand, consumption, imports and exports, surpluses and

deficits for all countries. The department now receives regularly the official reports of the International Institute of Agriculture at Rome and direct reports from the adhering governments. While valuable, these reports are not timely, as they are too slow in reaching this country. It is, therefore, necessary to supplement these sources of foreign crop information, and the department is advocating the employment of agricultural attaches in the same way and for the same purposes as these officials are now employed by many foreign governments.

"It is planned, also, to improve the methods of presenting the data obtained by the department. The commodity economists will be expected to prepare careful analytic statements in popular form, setting forth the essential facts with respect to relative supply and demand, for publication in periodical and special reports and in the press. These reports will be brief and well illustrated by maps, diagrams, and charts so as to be readily understood at a glance even by those who are not accustomed to analyzing statistics."

TAKE NO CHANCES

Have every part of your vehicle, implement and harness in good repair. Do good work and avoid dangers of accidents.

An Open Letter

TO ALL PRESENT AND PROSPECTIVE TRACTOR USERS:

We are conducting a series of PUBLIC DEMONSTRATIONS of Tioga Strength Tested Tractors in sub-soiling, discing, plowing, etc., and various kinds of belt work. These demonstrations will be held in all the principal communities in Southern California, and we want you to make it a point to attend at least one of them.

You, as a Tractor user in California, know that it requires the best quality of material and workmanship in a tractor to do your work efficiently day in and day out without continual grief.

TIOGA STRENGTH TESTED TRACTORS are built on this basis.

Tioga Tractors have been in operation in California for approximately three years and Tioga owners are always pleased to go out of their way to tell anyone the real service the Tioga has given them.

The Tioga Tractor will solve your Tractor problem, no matter what size farm or orchard you may operate.

Tanning Skins

THE Cultivator is repeatedly requested to give information regarding tanning and curing skins for leather or to retain fur. Here are a number of methods which have been given in former Cultivators, now gathered together and repeated in these columns.

Rawhide

The skin should be salted on the flesh side as soon as the hide is cooled after removal, using ten to 12 pounds to a full sized skin. After salting roll the hide tightly. When ready for tanning place the hide in "soak," simply water to remove blood and salt. After being left in this 24 hours the tail and feet may be cut off, after which the hide should be placed in lime water. To make the lime solution take a bucket of water to each quart of lime.

When thoroughly slaked and mixed, immerse the skin and allow to lie for three to four days. Thoroughly wash in cold water. Scour and pound in good soapsuds for half an hour, after which take white vitriol, alum, and salt, one tablespoon each to skin, and dissolve in sufficient water to cover skin. Let remain in this 24 hours. Wring out and dry. To soften, oil with neat's foot oil or currier's oil. It may again be washed out in soapsuds and hung until nearly dry, when it should be worked and softened. If it should remain hard and refuse to soften, repeat the soaking in suds.

Government Formula for Leather

To each gallon of water add one quart of salt and one-half ounce of sulphuric acid. This mixture should not be kept in a metal container. Thin skins are tanned by this liquor in one

day; heavy skins must remain in it longer. They may remain in it indefinitely without harm.

When removed from this liquor, the skins are washed several times in soapy water, wrung as dry as possible and rubbed on the flesh side with a cake of hard soap. They are then folded in the middle, hung lengthwise over a line, hair side out, and left to dry. When both surfaces are barely dry and the interior is still moist, they

Every Man's Hand Against Him
The United States Biological Survey is cooperating with various counties in California and Arizona in shooting and poisoning coyotes.

are laid over a smooth, rounded board and scraped on the flesh side with the edge of a worn flat file, or a similar blunt edged tool. In this way an inner layer is removed and the skins become nearly white in color. They are then stretched, rubbed and twisted until quite dry. If parts of a skin are still hard and stiff, the soaping, drying and stretching process is repeated until the entire skin is soft. Fresh butter or other animal fat, worked into skins while they are warm and then worked out again by a hasty bath in gasoline, increase their softness.

Curing Fur

To prepare skins for making ladies' boas, muffs, capes, etc., take the skin off whole by cutting from hock joint across vent to hock joint on opposite side and draw the pelt off over the head and cut off at a point back of ears; or, if the ears are to be left intact, let the cutting be done on a line extending around the point of nose. Then place the pelt on a stretcher made of half-inch board six inches wide at the top and four inches wide at the bottom. Cut this in two parts, from end to end. Stretch the pelt over the two, place edges together and rub salt over the pelt while fresh, and then sprinkle with powdered alum and allow it to dry. When about dry remove from boards and rub with the hands until dry. The skin will then be as soft and pliable as buckskin. Place your pelts where there will be plenty of fresh air, yet not in the direct rays of the sun.

Another method is to tack the skin taut, the fur side under, on a board, and after scraping the bits of fat off, moisten all over and sprinkle with a mixture of seven parts salt and one part pulverized alum. Leave about two days to absorb the salt. Then wet it again and repeat the mixture. About the fifth day wet it again and sprinkle with a mixture of two parts alum and one part salt. When dry it is cured and can be taken off the board. The above is from the "Belgian Hare Guide."

Here is another method of retaining fur:

There are numerous ways to tan a deerskin so the hair won't come out. Many processes will cause the tanned skin to be hard and stiff. The following will leave the hair on, yet the skin will be soft and pliable:

Soak skin in water over night, then remove all flesh and fat. Be careful not to cut the skin. Put good hard salt one-quarter pound, and alum three pounds, in sufficient water to cover the skin. Set over fire and boil until salt and alum are dissolved. When it cools to lukewarm put in the skin and soak five days. Work it well with a blunt stick once or twice every day. Then take it out and dry in a warm place in the shade. When apparently dry heat the tan water again and soak four days, working it every day as before. Then wash in several waters, soaking an hour or two in each. This is to get all the salt and alum out. As soon as the washing process is complete, beat with a wooden mallet until quite soft, then dry again in the shade. From time to time until it is thoroughly dry, rub and work the skin with the hands. This seems a good deal of work, but a soft pliable skin can only be obtained by work.—Rural New Yorker.

Still another: Remove all particles of flesh from the skin and give it a heavy dressing of equal parts of salt and powdered alum wet with a solution made from two parts of water to one part of liquid muriatic acid. Mix the salt and alum thoroughly dry. Mix the two parts of water to one of muriatic acid thoroughly, then use enough to wet the dry substance just enough to make it moist, but not really dripping. Having rubbed this into the flesh side of the skin, leaving a good dressing all over, fold the edges of skin in until they meet in the center all around. Do not let the dressing get on the fur side of the skin; when all folded right, roll up tight and place where it will be cool for 24 hours. At the end of this time examine the hide and, if dry, apply the dressing again and leave for 48 hours well rolled as before. At the expiration of the stated time unroll, stretch on a board and tack firmly in place. Melt up half a bar of soap and add to this as much cottonseed oil as it will

absorb by shaking hard. Rub the skin soft as desired; apply this again and one that should not be trouble with rub till about dry. This simple rule followed exactly should insure a smooth, soft, whitely tanned hide and one that should not be troubled with moths or insects. We have had a home tanned wolf skin rug in the house for many years and it has never had a moth in it and it is soft and pliable as need be. This is a simple and reliable rule and anybody need not fear to tan the skins he may get in hunting or trapping.

ALFALFA GROWERS' LETTER

The year closes without any material progress having been made in the solution of the most serious problem facing the farmers of the country, and indirectly all other interests, that of the great discrepancy in price between what the farmer has to sell and what he has to buy.

The cause of this discrepancy is undoubtedly to a large extent to be found in the heavy taxes and interest, besides his own, which the farmer has to pay. Manufacturers, railroads, merchants, etc., all add their taxes and interest "overhead" to their prices and thus pass it on from one to the other until it reaches the farmer, who pays for all in the prices for what he has to buy. The farmer is the last man in the line and cannot pass these charges on because under the existing marketing system his cost of production is not taken into consideration at all in the fixing of prices for his products.

The solution of the problem would therefore seem to depend on the finding of a marketing method by which his cost of production is the principal price determining factor. So far it has not been possible to find a general solution along this line. A partial relief has, however, been afforded by cooperative marketing. It cannot be denied that where farm products have been marketed by cooperative growers' associations, the prices obtained have usually been materially better than where they were marketed without such associations and, generally speaking, these prices were comparatively best where these associations were strongest in membership and efficient management.

Taking as an illustration our association: Though the cooperative marketing of our product, alfalfa hay, presents probably more difficulties than most other farm products, and though our association is still comparatively weak in membership it has nevertheless been able to secure for the California growers considerably better prices than they would otherwise have received, and also better than the growers in other states, without organization, have been able to obtain under otherwise similar conditions. In other words, cooperative marketing is the only way in which it is at present possible for the farmer to obtain some slight recognition as a price making factor on basis of his cost of production.

We do not claim that cooperative marketing alone will bring back prosperity to the farmers of the country, in fact we do not believe it will, but we feel sure that without cooperative marketing their fight for existence will be all the harder and the final outcome all the more doubtful.

POTATOES AND NEMATODES

The nematode question is becoming more and more serious to the potato grower. Touching upon its spread and the greater care required of potato growers Horticultural Commissioner Ryan of Los Angeles County says:

"Increased attention of recent years by state and county horticultural officials and growers to the nematode, or eelworm, problem has resulted in an agreement that thorough inspection of trees and nursery stock and the rigid exclusion of infested material must be supplemented by stringent rules directed against the sale of infested potatoes.

"It is expected that the state department of agriculture will soon issue rulings which will insure uniform procedure throughout the state. The Los Angeles County horticultural commissioner's office through the district inspectors is urging necessity of inspection of all potatoes used for seed purposes during the spring planting season. The thorough cooperation of

grower and dealer is necessary to accomplish comprehensive results in this work.

"The sale of potatoes from one grower to another must be followed by inspection. The planter of potatoes which were grown outside of his ranch who neglects to notify the inspector so that an examination may be made before planting is not only violating the state law but is taking a chance of growing a crop that may be denied a

market next fall if they should prove to be infested with eelworm.

"In the opinion of the officials and growers who are best acquainted with the menace of the nematode an effective check against further spread of the eelworm will not be secured until the sale of infested potatoes for any purpose is forbidden. Such a ruling, because of its far-reaching effect upon market conditions, cannot, however, be put into effect without due notice to

producer, consumer and dealer. In the meantime every effort should be made to insure the planting of clean seed potatoes and to prevent the planting of any potatoes in infested ground."

"Why don't you curse the blade?" he said,
'It lost its temper first.'

A Bit of the State Highway in Mendocino County

The NEW Bean Turbine Pump

Here is an entirely new idea in turbine pump construction—new, in the sense that it has not been offered generally to the growers of the state, although during the past year and a half there have been nearly a hundred of them installed in the Santa Clara Valley and elsewhere, and they have surpassed our highest expectations in efficiency, economy, and freedom from trouble.

No Bearings Below the Surface

We have eliminated all the drive shaft bearings below the surface. (Note the diagram.) A radial thrust bearing in the head takes up all end thrust, and operates in an oil bath. Lubrication troubles are unknown because there are no under-surface bearings to lubricate.

Built for 6-Inch Wells and Up

No need to bore a new well, for this new Bean pump is suspended entirely from the top and can be put into your old well, regardless of its size, from six inches up. It can be had direct connected with motor, or for belt drive.

Send for Turbine Pump Bulletin — which tells you more about this improved Turbine pump. Also—ask for our catalog of horizontal pumps, if interested in this type.

REASONS FOR THE AGRICULTURAL BLOC

(Continued from Page 27.)

credit has overlooked the peculiar conditions of agriculture.

Not Devised for Farmer

Commercial paper is the key of banking credit. Credit machinery and facilities have accommodated themselves to the needs of commercial and manufacturing business. Since this business ordinarily has a turnover measured in weeks, bank credit has adapted itself to such periods of duration and renewal. We have the thirty day, sixty day, and at most ninety day note, and this arrangement perfectly suits commercial business. In fact that is the reason we have it. It does not suit farming business, yet this fact has not in the least modified the practice, demonstrating conclusively that bank credit does not concern itself seriously with the industry of the production of the world's food supply. The farmer's turnover is

of the facilities of bank credit for the special benefit of merchants and manufacturers, and their particular function is to find the widest market, often in the small country or farm bank, for the paper of great commercial houses.

But where do we see any extension of bank credit that helps the farmer finance his business? He has paid the highest interest rate for working capital, not because his credit is naturally inferior to that of commercial business, but because the banking system has grown up in places and under conditions remote from those of farm industry.

To Fill Credit Gap

It is not the purpose of the agricultural bloc in the banking credit measures it advocates to supply the farmer with a more generous line of credit than other industries, but to fill the wide gap that has existed between his industry and the credit that all other industry enjoys. It is merely a belated effort to meet a profound need of agriculture. The purpose of the credit bills is to create banking facilities for the farmer adjusted to the times and seasons of his need, not

Bordered With Olives

Many ranchers, especially in older settled sections of California, have utilized the olive as a street tree.

mainly once in twelve months. Furthermore, the supply of bank credit has no relation to agriculture, but regards commercial and manufacturing business only. The banks have mainly concerned themselves with supplying the credit needs of "business," in which farm business is not consciously included. But even so, the banks have not adequately met the need of commercial business. This appears by the development of one auxiliary credit organization after another. We have the discount companies or commercial credit companies that buy accounts of merchants and manufacturers to increase mercantile and manufacturing working capital. These modern institutions of very recent creation now do an extensive business of auxiliary banking for the benefit of business in cities. Of recent origin too, are the commercial banking departments of trust companies, under more liberal regulation than banks, created to meet the demands of commercial and manufacturing industry. And finally we have the commercial paper houses. According to Prof. H. G. Moulton, of Chicago university, in his book recently from the press, "The Financial Organization of Society," these last did a business in 1919 of upwards of \$4,000,000,000. They are an extension

to give credit where credit is not warranted. The bills provide for ample security for any credit the farmer asks, but they take notice of the longer period of his business turnover both as to crops and as to livestock. The farmer in the past has had the credit facilities only of the little country bank. The agricultural bloc was instrumental in obtaining the enactment of the agricultural credit bill, through which a maximum of \$1,000,000,000 credit may be extended to farm loan organizations and to banks and trust companies making loans to farmers, and through which the War Finance corporation may make advances not exceeding one year to producers or dealers in the event of a market glut, and may advance credit to any cooperative association, bank or trust company which has advanced funds for agricultural purposes, as well as credit for the breeding, fattening and marketing of livestock.

Fed Up on Oratory

Many Americans give little thought to the agricultural industry. It is removed from the populous centers of the country. The farmer is isolated, he stands alone, the last of the individualists, depending for his success upon his own efforts unassociated with

others. Yet he conducts an industry aggregating an investment value of \$80,000,000,000, and with a normal output of something like \$20,000,000,000. He is "fed up" on political camouflage and promises, on Fourth of July oratory extolling his loyalty, his industry, his patience, and his fidelity to his job. He is weary of hearing that he is the "backbone" of the country, its "bone and sinews," only to be forgotten when business is to be done and results harvested. He is asking for a square deal and equal treatment and consideration with others, for the right to act in cooperation and to handle his products through to their ultimate market, with adequate credit facilities. Oratorically the farmer has been well treated. Practically his needs have been neglected by those who have made the laws and the modern machinery of the industrial order. He has awakened to his own situation. When the after-war collapse occurred it was the farmer who was without the organization and machinery to protect himself, and he saw his products made the football of speculation and gambling.

Should be Hailed with Joy

When an \$80,000,000,000 industry capable of supplying the nation annually with \$20,000,000,000 of new wealth, and 50 per cent of its bank deposits lies flat on its back, it would seem that rescue parties might better be hailed with joy than viewed with alarm, and that whatever will promote the primary industry of food production might well be regarded as of the common good, rather than as class legislation and a menace.

Selling Olives

By request we recently wrote the state board of health asking as to the present ruling in the matter of producers selling olives cured by the cold lye process. Secretary Dickie writes:

"In reply to your letter, would beg to state that the rules and regulations of the California state board of health are still operative in reference to the requirement that all olives offered for sale or consumption shall be sterilized at a temperature of 240 degrees Fahrenheit for a period of not less than 40 minutes by means of a retort or autoclave which shall be controlled by an automatic self recording thermometer or heat measuring device in proper working order.

"It is not our desire to work an injustice upon the growers, but after the unfortunate occurrence of botulinus poisoning from ripe olives and the exhaustive investigations that have been made by the foremost scientists on food poisoning (especially botulinus poisoning) we feel the necessity of rigidly enforcing these regulations, and desire in the interests of the public health the cooperation of the olive industry as a whole."

In addition Mr. Dickie encloses a circular letter which gives much information as to the effort to restore confidence with the Eastern trade.

"Because of the occurrence of an olive poisoning case in Greensburg, Pennsylvania, on June 21, 1921, and the consequent newspaper publicity thereon, the impression probably has gone forth that ripe olives are still dangerous or that the regulations of the California state board of health issued last year have not been effective. Both these assumptions are incorrect. The olives in the Greensburg case were of the very large or Ascolano variety and were packed in glass. The temperature at which they were cooked did not exceed boiling point. They were found to be a part of a lot that were processed in November, 1919, nearly a year before the California state board of health issued its ruling requiring the cooking of all ripe olives at 240 degrees Fahrenheit for 40 minutes.

"The rules and regulations of the California state board of health require that all olives offered for sale or consumption shall be sterilized at a temperature of 240 degrees Fahrenheit for a period of not less than 40 minutes by means of a retort or autoclave which shall be controlled by an automatic self recording thermometer or heat measuring device in proper working order, and that the temperature records shall be available at all times to the representatives of the state board of health, and that the

Nobody can impartially study the history of agriculture and conclude that it has not been sorely neglected. It has "just grown." For a century and a half, nearly everything we have done, every system we have contrived in marketing, transportation and banking, has been built to fit the development, happiness, and profit of city life. A department of agriculture and a few agricultural colleges have been regarded as meeting our obligations to agriculture. And so they would, if all that agriculture needed was advice. But it needs to grow and prosper in organized efficiency like the rest of the modern, highly organized world.

Many Farmers Insolvent

In Central Illinois, the heart of the most fertile agricultural region on the globe, more farmers have gone bankrupt and been sold out by the sheriff in the last year than in many preceding years together. One of the most successful and respected farmers in the United States, J. R. Howard, president of the American Farm Bureau federation, has declared that 1,500,000 of the 6,000,000 farmers of the country are today insolvent. Agriculture is sick. The measures supported by the agricultural bloc are not proposals to give the farmer something for nothing, nor are they class legislation. They are the remedies urged by economists and students of agriculture, and above all by the farmers themselves, to uplift this fundamental industry to a place where it will be a blessing to the country because it is self sustaining and prosperous.

food and drug department of the state board of health is instructed to seize and quarantine all ripe olives which are not produced in conformity with the rules and regulations of the state board of health and to institute action for their condemnation and destruction.

"In view of the extensive investigations made in reference to the processing of ripe olives, especially with reference to botulinus poisoning, the California state board of health is persuaded that the enforcement of the above regulations removes all danger from ripe olive poisoning."

Notwithstanding the necessity for restoring confidence to the trade we should give justice to the producer and permit disposal of his product if he can do so without menace. It is worthy of most careful consideration on the part of the board of health and the growers. Meantime, if the regulations are to be enforced the only recourse open to the producer is to sell to packers who are fitted for the processing of olives or provide his own sterilizer. This latter may be done without prohibitive cost.

DEHYDRATER EFFICIENCY

"Some Factors in Dehydrater Efficiency" is title of Bulletin 337 just issued by the University of California Press. It is written by W. V. Vuess and A. W. Christie and gives results of careful investigation and experimentation in much practical detail. It may be secured by request to Agricultural Experiment Station, Berkeley, California. From summary and conclusions we quote:

The cost of a dehydrater erected by the average fruit grower for operation during a season of only one or two months must be as low as is compatible with reasonable efficiency if it is to be profitable.

A completely equipped and satisfactory dehydrater can be built for \$500 or less per green ton capacity per 24 hours.

The air blast tunnel type of dehydrater is the most economical to operate in regard to both fixed charges and operating costs.

For efficiency, the velocity of air across trays should not fall below 500 feet per minute, while the total volume of air per 100 square feet of tray surface should not be less than 250 cubic feet per minute.

In order to reduce static pressure and secure maximum fan capacity, all air passages should be as large in area, as short in length, and as direct as possible.

Inefficiency will result unless all the heated air flows between the trays of drying fruit and is equally distributed among the several trays. This can be accomplished readily by proper relative dimensions of the drying chamber and trays, supplemented by the intelligent use of baffles and dampers.

Multivane or steel plate fans, although more costly, more than repay their extra cost by their greater efficiency, especially in large dehydraters where high static pressure must be overcome.

Fruits which are sulphured should be dried on wooden trays, preferably with slat bottoms. Unsulphured fruits are most rapidly dried on screen trays.

Air of 20 to 50 per cent relative humidity is advantageous in the dehydration of fruits which case harden readily. Such moist air permits the steady evaporation of moisture from the fruit at relatively high temperatures.

Prunes and grapes are most rapidly dried if previously dipped in a boiling lye solution. The first requisite of any

dipper is a source of heat sufficient to maintain the lye solution boiling constantly during operation.

TARIFF OR BUST

Manager Tucker of the California Almond Growers Exchange writes: "The situation in which 5,000 California almond farmers find themselves is more acute than ever. They have reached the limit of their ability to take losses. Unless congress grants the five and 15 cent import schedule asked by our growers against the flood of peasant raised almonds of Southern Europe, we who have nurtured almond growing in California for the past 12 years hesitate to reckon the sacrifice."

Examination of candidates for county horticultural commissioner and deputy will be held at Los Angeles, February 16-17; Fresno, 20-21; San Francisco, 23-24; Sacramento, 27-28.

Who Gets the Rent?

I agree to sell rental property to a party through title company and give instructions to the escrow office to make search of the title. The purchaser deposits the money with the escrow office with instructions to pay over when the title search shows a clear title. The title search is accordingly made and the deed passes about three weeks after the purchase money had been deposited. The vendor claims the rent of the property up to the date of recording of deed. The vendee claims the rent from the day of deposit of purchase money. Is he entitled to this rent?—Subscriber, Glendale.

The vendee deposited the purchase money upon condition that the title search show a clear title. If there had been a defect in this title, by the terms of this deposit he would not have considered himself at all liable for the payment of the money. He merely deposited this money with his own agent, the title company, for the payment to the vendor in case the vendor's title was good. This condition was not fulfilled until the date of the recording of the deed. Therefore the vendor was the owner of the property up to the date of delivery of the deed. When the title company made delivery to the vendee, recording the deed, then title passed. The vendor would accordingly be entitled to the rent of the property up to date of delivery or recording of the deed.

Better Make Will

My aunt desires to build a house on my lot so that I may look after her during her lifetime, settle her affairs after her and retain the balance. The moneys in the bank are deposited in joint name, payable to both her and myself. On her death does the house revert to me as owner of the real estate? Should there be any other provisions concerning the money or the property so as to eliminate any trouble from other heirs?—Subscriber, San Bernardino.

It is true that a house erected upon land of another becomes a part of the real property and therefore belongs to the owner of the land. The money is subject to the check of either of the parties, but it would be a very wise precaution, especially where there are other heirs, to have the aunt make a will giving all the property to you in case of her death. It may be you would not be required to probate such will, but if it became necessary it would relieve you of much trouble and possible litigation.

Will Undated

My sister some time since made a will but omitted to put a date on the will. Is such a will valid?—Subscriber, Los Angeles.

If the will is an olographic will, that is, one written and signed only by the testator herself, it does not need to have witnesses, but must be fully dated by the testator. In the case of what is termed a written will, there is no requirement of law that it must have a date.

Wife's Signature

In case I have my bank account in my wife's name, is it necessary for her to sign her maiden name or married name?—Subscriber.

It seems to be the universal custom that after marriage a woman takes her husband's name, so it would seem to

be that she should sign by her married name.

Separate Property

A man has accumulated property during the period of his first marriage. The first wife died. He has two children. The husband again married. Should the man die without a will, what share would the second wife receive under the law? In case the husband desires to have the wife and children share equally at his death, would this be done by means of a deed or would it be better to make a will?—Subscriber, Puente.

On the second marriage the whole of the property was the separate property of the husband having two children. On his death without a will, the wife would receive one-third and the other two-thirds be divided equally between the two children. This property being separate is absolutely at the disposal of the husband by will. The property can be disposed of by deed, but such deed must be delivered during the lifetime of the husband. The difficulty of such disposal of property consists in proving delivery where the deed is not in fact recorded. It is always better and safer to make a will in such instance.

Wife's Property Lost

In case of the death of a wife what share of the property goes to the children by a former marriage? When she married the present husband she had money of her own, which with her consent was invested in a business and lost.—Subscriber, Fresno.

The money which she had at the time of her marriage was separate property. As it was invested and lost it has gone and all property would be community property. In case of community property on the death of the wife the whole property without administration belongs to the surviving husband. Consequently in the event stated the wife would have nothing to leave to her child by her first husband.

Pasture Rent

A party has pastured three horses with me for some three years. He has never called for them nor paid pasturage. How can I settle this matter?—Subscriber, Caruthers.

Those who pasture horses are by law given a lien, dependent upon possession of such animals. If he be not paid the amount due for his pasture account within 20 days after the same shall have become due he may proceed to sell the animals or as many of them as may be necessary to satisfy this lien and costs of sale by giving at least ten days' previous notice of sale by advertisement in a newspaper in the county in which the property is located. The proceeds of the sale are applied to the discharge of the lien, the cost of keeping and selling the property, and the remainder, if any, is paid over to the owner; if default of such owner then in the county treasury.

Sewer Assessment

I purchased land last January. A deed and certificate of title showed the property clear. It now seems there is an assessment for sewer which was levied on the land prior to the time of purchase. Who is obligated to pay this assessment?—Subscriber, Arlington.

Frequently the title people reserve from the guarantee any undertaking for city assessments. So it would be necessary to look to the exact terms of the guarantee as to whether they could be held liable therefor. However, under the deed, if it is the usual form of grant deed, the grantor covenants by the use of the word "grant" just as though it was written in the deed, that the estate granted is at

the time of the execution of the conveyance free from encumbrances done, made or suffered by the grantor or any person claiming under him. Suit may be brought on this covenant to recover the amount of encumbrance which the grantee has been obliged to pay to clear the land. It would seem, therefore, that you should pay the assessment and then bring suit against the grantee.

Land Sold for Taxes

I purchased land in October, paid the taxes thereon, but when next year's notice came I saw that the place had been sold for taxes. It seems that a personal tax of the grantor's husband had been assessed against the property. Am I under obligation to pay this personal tax?—Subscriber, Hemet.

The tax was levied while the property was owned by the grantor and although the personal tax was that of the husband it was evidently assessed with the consent of the wife. The tax collector is not at all concerned with matters between you and the grantor, so it would be necessary for you to pay the tax, together with the penalties to date, and then you could recover this amount from the grantor.

Performance of Contract

A lease on land was made nine years ago by husband with option to buy inside ten years. The husband died, leaving deed of gift to wife, who wants to know if she is bound by contract which was not signed by her. Gift deed was prior to lease.—Subscriber, Charter Oak.

If the lease and option were recorded prior to the deed the lessee would undoubtedly be entitled to enforce this contract, not only with the husband but with any assignee or grantee of the husband. If the deed was first recorded, of course, the wife would not be bound. In case the property is community property it very probably will be true that the lease made without the signature of the wife would be insufficient to bind her and the lessee would find that he is not entitled to maintain any action for specific performance for this contract.

Which Pays Taxes?

Which party is expected to pay taxes on property sold September 21?—Subscriber, Covina.

State and county taxes become a lien upon real estate on the first Monday in March of each year, although the amount is not definitely fixed until later. Taxes upon all property sold after that date must be paid by the grantor unless it is otherwise agreed between the parties, and the grant deed of the grantor by express terms otherwise states.

Horses Break Pasture

Horses break out of a pasture and go on the state highway at night. A party driving on the highway runs into and hits two of the horses, causing damage to the car. The owner of the horses had a good fence but in some way the horses broke the fence down. Who is obliged to pay damages?—Subscriber, McFarland.

The motor vehicle act provides that no person owning or controlling livestock should voluntarily or negligently permit said animals to stray upon or run unaccompanied by a herder on the public highway either side of which is adjoined by property separated from such highway by fence, walk or building. Nor should the tether of such animals be permitted to lie across or on the highway; any person driving livestock upon the highway between sunset and sunrise must keep herders ready to keep the road open. It thus becomes a question as to whether there was any negligence

in permitting the animals to go on the highway. If there was a good fence and a good gate and it was only through some unforeseen circumstance that the horses got out, it would appear that this owner is in no way liable for damages to the car.

TRUCK PLANTS START 1922 BUSINESS DRIVE

By E. Y. Watson

That the motor truck industry is entering on a period of intensive merchandizing to realize on possibilities for better business that are presenting themselves is indicated in plans that several of the leading factory units are making to put the retail end of the business on a better basis.

Profiting by the experience of the readjustment period the factory executives now realize that truck salesmanship is going to be a process of education. They are going to "sell transportation" in reality and not merely offer it to the user more or less blindly as the practice has been in the past. In this respect, liquidation of business generally has resulted in a situation which favors the larger makers. The process of survival of the fittest, which has been going on for a year or more, has eliminated a host of the small fry who were flooding markets in all sections with assembled products. Their resources were small. Their trucks were poorly engineered and designed and the service they gave left them one step removed from the "orphan" designation. Schools of truck salesmanship have been conducted by several of the larger factories in the past but the results from them have fallen short largely because the business slump slackened normal demand and caused the effort of the "educated" sales force to be lost.

It is certain that the present outlook indicates a renewal of buying on a scale that will promote much factory activity.

HOME SEED TESTING

A very simple seed testing apparatus is one composed of two plates, china or tin, and two pieces of blotter cut to fit the plates. In the bottom of one plate is put one of the blotters which has been well soaked in water. On this piece of blotter is put a counted number of seed. On this is put the other piece of blotter, which has also been well soaked in water, and over it all the other plate. The tester is then put in a fairly warm house and looked at every day. If the blotters are dried they must be wetted again; otherwise nothing is to be done. At the end of ten days to two weeks a count is made of the seed that have germinated and from this one determines whether the seed is worth planting and how thick to plant it.

IN 1922

In a telegram to the editor of a western agricultural paper Secretary Henry C. Wallace made the following encouraging statement:

"The agricultural outlook for 1922 is favorable. We should see marked improvement over conditions as they have existed this year. Time will be required for full recovery, but we have reached the bottom and are on the upgrade. The most important things farmers should work for are the perfection of their cooperative selling organizations with a view to putting the marketing of farm products on a thoroughly sound business basis and the careful study of needs of the consumer and intelligent adjustment of production to these needs."

CANTALOUPE IN NEVADA

From a few small demonstration plats in 1917 the muskmelon industry in Churchill County, Nevada, has developed until 350 crates a day were shipped by express during the 1921 season, besides a carload to Pennsylvania and another to San Francisco. A goal of 1,000 acres has been set for 1922. A small acreage in 1919 was more than doubled in 1920. The county agent, employed cooperatively by the United States department of agriculture and the state agricultural college, assisted in the location of markets and advocated the organization of a cantaloupe association which was later effected.

GOODYEARS, THROUGH AND THROUGH

Alongside the famous 30 x 3½ inch Goodyear All-Weather Tread Clincher shown here, is its companion, the 30 x 3½ inch Goodyear non-skid.

More than 5,000,000 of these Goodyear non-skid tires have been sold in the last five years.

Built of the same high grade Egyptian cotton fabric that goes into the All-Weather Tread Goodyear, with a long-wearing but differently designed tread, they have given remarkable service.

Their splendid performance has proved to thousands of car owners the folly of buying unknown and unguaranteed tires of lower price.

Ask your Goodyear Service Station Dealer about them.

Lessons From the Recent Windstorm

By Robert W. Hodgson, Farm Adviser, Los Angeles County

GAIN the usual "unusual" thing has occurred. Although by no means as severe or injurious as its predecessor of two seasons ago the recent windstorm demonstrated that wind prevalence and exposure is an important item in relation to successful citrus and walnut culture. And while some districts suffered less than others it is now fairly evident that no district in Southern California can claim to be free from occasional injurious winds. If there be any special lessons which orchardists may derive from the occurrence of the recent windstorm, it seems primarily the realization that just as in the case of

frost wind probability exists as a definite hazard of the business which every well informed orchardist will prepare against insofar as the hazard warrants the expense.

Windbreaks

Windbreaks properly handled in districts where wind prevalence is normally high have accomplished wonderful results. The yearly lowering of the curve of mean wind velocity through extensive planting of windbreaks through the Fontana-Cucamonga section is a matter of scientific record and the best possible proof of the efficacy of windbreaks, and the same has been demonstrated most sat-

isfactorily elsewhere in numerous instances.

The writer feels, however, that as a means of insurance against wind injury in districts where only occasionally do injurious winds occur, the planting of windbreaks is a practice which may hardly be expected to prove a profitable investment. The space required for an effective windbreak, the ground taken out of profitable cultivation, the water necessary, and the frost hazard through banking up of still air, taken together may be sufficient to make a windbreak undesirable.

Framework

The most important means of insuring against wind injury is formation of the framework of the trees to secure maximum strength.

Much of the injury in the recent storm could have been avoided had more care been taken in the training of the young tree. In practically every case where citrus trees had split badly it was noticed that all the main framework branches, from three to six or eight had been allowed to come out at about the same point, thus focusing all the strain at one point in the framework system. The greater part of the breakage in walnut trees was observed to occur under almost similar conditions and especially where the open vase form for the main framework branches had been followed. In no case was a tree formed of a main central leader with well-spaced laterals found showing much breakage.

Bracing

With the majority of orchardists, however, the trees are long since past the period of framework formation and interior bracing is necessary. Movable props can only be recommended for unusually heavy crops and not as a means of prevention of wind injury. For this purpose the best system yet devised consists of permanent interior wire bracing, using a central ring from which wires extend to the principal framework branches. If the work is carefully done the strain is divided equally among the branches supported and breakage reduced to a minimum. This is not the case where cross wiring is resorted to, wires extending through the center of the tree and fastened to branches on opposite sides. With the former system if through accident one branch breaks, the others share the strain equally and no further breakage results. In the latter, if one breaks the other is almost certain to as well.

With citrus trees and most deciduous varieties ordinary galvanized wire about the size of baling wire is sufficiently strong, but with walnuts a much heavier wire and double strands are necessary. Wire should never be wound about the branch braced as this means girdling. The safest method of attachment is the screweye excepting where the branches are unusually large, in which event eye bolts extending clear through the limbs should be used, as is the practice with walnuts. Some walnut growers, however, favor use of heavy screweyes. Where the branches are not large an ordinary cement covered staple gives good results and is much more easily and quickly used. Heavy enameled or galvanized rings or strong washers are satisfactory. The use of long bolts is losing ground on account of the expense involved.

Once a year or thereabouts the bracing should be inspected and broken branches repaired and additional work done as may be necessary. The expense of such work varies from 15 or 20 cents per tree to a dollar and a half or more for large walnut trees, but if properly done is practically everlasting.

Treatment of Injured Trees

Many of the trees broken down during the recent storm may be salvaged if given proper attention. Few of them will ever again be as strong as before but may be saved for profitable bearing. Where breakage is severe it may be necessary to rehead the tree. In the case of citrus the broken branches should not be removed at this time but allowed to remain either temporarily braced or as they occur until late spring, when they can then be removed and the tree cut back to throw out new growth and form a new head during the coming season. Where the crotch limbs have been split the limbs should be pulled back into position as soon as possible and braced as

described above and in addition drawn tightly together at the point of splitting by means of slender bolts on both ends of which good sized washers are used. The shredded and dried bark should be pared away and all exposed surfaces covered with a good wound dressing. If the work is done carefully in two or three years the wounds will many of them be entirely healed up and the tree almost as good as ever.

In a number of instances where irrigation had just been completed or was under way large walnut trees were blown down. The majority of these may be saved by pulling back into position and propping until the ground dries out somewhat in the spring. Where breakage has also occurred topping may be necessary to secure a well balanced top.

FIGHTING THE PEA APHIS

By A. W. Morrill, Consulting Entomologist

The pea aphis has the reputation of being one of the particularly difficult species of plant lice to combat. Several methods of control have been used with more or less success. Spraying with soap mixtures is probably the oldest method, modified in late years by the use of nicotine sulphate combined with soap, the latter in a relatively minor proportion. Wet spraying with a nicotine and soap mixture by means of a power or traction sprayer gives good results when the pea vines are small. At the Maryland experiment station about 20 years ago a simple method of pea aphis control was devised whereby the insects were brushed or shaken off the vines into collecting pans which were drawn along between the rows, or were knocked off onto the ground and buried by following immediately with a cultivator. This method dispensed with insecticides except for a very small quantity of kerosene when the pans were used. This method has been modified in California with good success by several pea growers by shaking the insects off on one side of the row, turning the vines toward the opposite side and killing the aphids on the ground with nicotine dust. For small home gardens probably the best method of pea aphis control consists of covering a ten or 12 foot section of a row of pea vines with a sheet or a piece of canvas resting on a frame made of light scantling and fumigating with nicotine fumes by burning a small piece of nicotifume paper, leaving the cover in place for 15 or 20 minutes before moving it ahead in the row and repeating the operation.

During the last two seasons control of the pea aphis by dusting has become the principal method used in some of the leading pea growing sections. Nicotine is the "active ingredient," legally speaking, of the dusts used, but few who use these insecticides realize that the effective strength against insect pests is not measured by the percentage of nicotine or nicotine sulphate contained in the finished product or used in its manufacture. The so-called "inert" ingredients in the case of nicotine dusts are of the greatest importance in connection with the commercial value of the insecticide. Sulphur as a substantial part of the carrier or inert ingredient (leaving out of consideration its value in checking the mildew of the pea vines) may give nearly twice the effectiveness of a lime dust containing exactly the same amount of nicotine. It is also known that the different grades of lime used as a carrier give insecticides of different values with the same amount of nicotine. Without going further into this subject it is sufficient to say that the guarantees as to nicotine content or nicotine sulphate content are very likely to be misleading to one who does not understand the difference between nicotine sulphate and nicotine, and the difference in the effectiveness of different combinations of the "inert" ingredients. Everything considered it is safest to rely upon the reputation of the manufacturer and of the special brand of dust recommended for the pea aphis. Use the dust that gives the best results at the lowest cost regardless of the percentage of nicotine or nicotine sulphate guaranteed on the label.

Ramona, San Diego County, received about 18 inches of rain during the storms from December 18 to January 2. This insures plenty of water in the wells for several years.

CALISPRAY DUST

Kills Pea Aphis Instantly

Pea Vines of this year are having a hard fight against Pea Aphis. Protect your crop from this pest by dusting with Calispray No. 1 Nicotine Sulphur Dust—which kills Aphis instantly and prevents Mildew!

Citrus Trees should be examined at once for the appearance of Aphis. At the first indication of Aphis dust with Calispray No. 1 Nicotine Sulphur Dust to protect your trees and fruit. Insist on Calispray and be sure of results!

The American Beauty Dust Sprayer

Use this economical machine for applying all forms of dry insecticides. The cost of operation is low, it does the work easily and surely and is operated by one man. The grinding and sifting device furnishes a perfectly blended, pulverized dust—which is forced inside of the tightest curl or bud by means of the powerful bellows.

Be sure you get an American Beauty!

*Largely border rows and small acreages with many oil varieties.
**Groves generally neglected and of unprofitable varieties of fruit.

MARL

There is many an orchard in California planted on rich appearing surface soil, the growth of the orchard proving luxuriant for a few years and later leaves yellowing and showing sickly condition of tree. Some of these orchards have been found upon investigation to be underlaid with a marl or calcium carbonate formation which in such excess quantity proves injurious to some trees, yet, strange as it may seem, that same marl pulverized and applied to other orchards and fields under other conditions proves one of the most beneficial applications which could have been made. This form of calcium carbonate is a wonderful soil sweetener and where acid conditions obtain has proven a profitable application. Prof. Voorhees of the New Jersey agricultural experiment station says:

"Marl is an important amendment to the soils, not only because of its content of mineral constituents, but because these constituents are associated with products that exert a very favorable mechanical effect upon soils. Large areas of land in the state of

New Jersey, formerly unproductive, chiefly because of physical imperfections, have been made very productive mainly through the application of marl. Although lime has been employed as a fertilizer for so long a time, it is only in recent years that its action has been explained, and at the present time there remain for investigation many questions concerning the action of lime upon the soil."

Lime in the form of marl may be pulverized and prepared for application to the soil much cheaper than limestone may be ground and is abundant in many sections of the state. It has been declared to be a most convenient form to apply to citrus and walnut orchards and alfalfa fields.

REDUCES WALNUT LOSSES

Pursuant to provision of the act approved May 27, 1919, for the control of the walnut codling moth, Harry Stiner of the bureau of pest control, California department of agriculture, has returned from a three months detail in Southern California where he inspected the walnut packing houses in connection with the treatment of

sacks to destroy the hibernating stages of this destructive pest.

After the costly outbreak of the codling moth in 1918 it was found that the principal means of distribution of the pest was through the medium of empty sacks moving from the packing house back to the grove for refilling, thus in many cases nullifying the good results of spraying adopted by careful growers and causing infestation of clean premises.

The "sterilization" process consists principally of treatment with live steam, vacuum fumigation or ironing out the sacks on a laundry machine, and during Mr. Stiner's southern inspection trip some 650,000 empty sacks were so handled by the walnut packing houses.

INTERSTATE SEED EXCHANGE

Potato growers in all parts of the world have found that seed potatoes from other parts produce better than local seed, some for the first year only, but some continue vigorous for several years. Gardeners in the eastern states and elsewhere claim that sweetpea seed grown in California and flowered in damper climates produces the finest blooms on the longest stems. It is well known that sections of the great United States are so remote from each other that fine strains of flowers, fruits and vegetables long are grown in one part without being known universally. More interstate exchange should prove of great value. A. D. Shamel, local physiologist in

charge of Uncle Sam's work, recently found a pea in Louisiana that appeared superior to anything grown in California, a pea also of superior flavor. Mr. Shamel suggests it may even prove weevil resistant in California. So he brought some home and will have it grown to prove its value. If it proves superior to any we have it will be of immense local value; if it prove poor the trial will still be of interest and value. More of such seed exchange should be carried on.

Treat Your Soil With Toro Brand Agricultural Sulphur

Improves alkali soil, transforms latent potash and phosphates into available plant foods.
Prevents wire worms, eel-worms or nematodes, smutty grain, ants, and potato scab.
220 lbs. per acre has increased crops up to 500%.
For dry dusting, use "ANCHOR" Brand Velvet Flowers of Sulphur.
For Lime Sulphur Solution, use DIAMOND "S" Brand Refined Flour Sulphur. Sold by leading dealers.
Write for circulars Nos. 6 and 6, price list and samples. State for what purpose sulphur is to be used.
SAN FRANCISCO SULPHUR CO.
624 California St. San Francisco, Cal.

"More Potatoes"

From ground planted secured by use of The KEYSTONE POTATO PLANTER than by any other method of planting. Work perfectly accurate. A simple, strong, durable machine. Write for CATALOG, price, etc. A. J. PLATT, MFR. BOX 8 STERLING, ILL.

Temecula Grown Seed Potatoes

Experiment has proved that potatoes from the hills of Temecula on account of the unique soil and climatic conditions as well as the possibilities of isolation are healthiest, most dependable and most prolific in yield.

A & M Special Brand Certified White Rose Seed potatoes—the very cream of Temecula—are grown in uninfected soil and all hill selected. Raised by the best growers in the state and free from disease or defect.

Insist on A & M seed potatoes. They're the best and most reliable.

THE OPTIMIST

I sing a song to the Optimist,
To the man who is brave and strong,
Who keeps his head when things go right
And smiles when things go wrong.

I'm proud of the genial Optimist,
His radiant voice and speech;
He helps to smooth the rugged path
Of all within his reach.

I like the way of the Optimist,
Who looks for the bright and best;
He scatters sunshine as he goes,
And leaves his fellow blest.

So here's a song to the Optimist,
Who works and laughs and sings,
And daily shows this weary world
The way to better things.
—Grenville Kleiser in January Nautilus.

WHEN MARY PAVED THE WAY

By Mabel McKee, in Youths Companion

ALL the morning the first floor of Wright's Bazaar had been in a state of suppressed excitement. If the manager of the store had announced a change in the time schedule, or in the wage schedule, he could not have aroused more emotion than did Miss Peters, the little, middle-aged woman who had had charge of the toilet requisites at Wright's for several years.

"For one week beginning tomorrow," she said, "there will be in this department a demonstrator from New York."

A chorus of protests followed her announcement. "Miss Lane is Baer's best demonstrator," continued Miss Peters, not a whit disconcerted by the protests. "She gets a salary of one hundred dollars a week and expenses. Mr. Sam Wright says that one of the Baer's managers told him that she was worth a great deal more, too. It's a splendid chance for you girls to learn more about selling toilet goods. And more than that, Mr. Wright has decided to let Miss Lane choose one of you girls to demonstrate toilet articles for the month after she leaves."

She paused impressively. For a minute the girls were silent, and then little Lottie Martin giggled, "Who wants to demonstrate after she has been here? No one would even look at you or your goods after they had seen her."

Several of the other girls nodded; all of them showed that their interest in the subject was waning.

"You might say that, if that were all," Miss Peters went on quietly, "but it isn't. It means a raise in salary for the fortunate girl—two dollars a week. Also Mr. Wright said Baer's firm was always watching for new girls to train to be their demonstrators. All any girl needs who wants to get a chance with Baer's is Miss Lane's reference. I only wish I were younger."

This time her speech won instant attention. Lottie Martin's scorn lessened, and she began to ask eager questions. Soon questions were pelted Miss Peters thick and fast. Before she left for luncheon she knew that every girl in her department longed to be the new demonstrator's appointee.

In the rest room while they were eating their luncheons the younger girls continued their discussion. "I'm glad Miss Peters told us today," said Lottie. "It gives us a chance to make a better appearance before the demonstrator comes and sees us. My sister, who is a milliner, says that first appearances count most."

That night Mary Hewlett told her mother of the coming of the demonstrator.

"Of course every girl in our department is going to try for the place," she said. "And all through the noon hour and during every spare minute this afternoon they planned how they would dress. They have to wear the store's regulation white waists and black skirts, but they're all going to wear their best ones, and some of them bought new, white crepe de Chine blouses."

Her mother smiled encouragingly, and Mary continued: "I wish I had a crepe de Chine waist, mother, or at least something more attractive looking than just my plain linen blouses. I don't feel as if I'd have a chance for that place. I know my linen waists are pretty enough for this little home town, but the demonstrators from New York, and what will linen waists look like to her?"

Mrs. Hewlett laid her sewing in her lap. "If you bought and wore a new crepe de Chine tomorrow, you wouldn't be natural, dear," she said quietly. "The demonstrator would know it, just as well as everyone else who bought of you. Besides, your pretty, plain linen blouses are just as expensive and much more tasteful than most of the girls' cheap crepe de Chineses are. Remember, you are a worker at the store, not a customer. And you must dress as a worker, if you want the respect of your customers."

Mary assented, but in her heart she was discouraged. She was even more discouraged when she saw the other girls' elaborate coiffures and manicured hands. She knew that her companions would look just like the shop-girls in New York, and that Miss Lane could not fail to notice it. She herself felt so much out of place when the demonstrator came in that she tried to keep in the background.

"She is beautiful," Mary told her mother that night, "very, very beautiful, mother, but in such a quiet way, just like you, dear. She has masses of bronze hair, but she wears it in a simple coil at the nape of her neck. And she wore a plain serge skirt and a white linen waist. I was so glad that I didn't get a crepe de Chine. It made us seem sort of comrades, and she asked me to do more things than she asked any of the others to do."

When, after a month Miss Lane left, Mr. Wright told Mary that she was to do the demonstrating for the following month.

"It gives you a chance to rise even higher than this, Mary," he said as he stood at her counter. "Miss Lane said that when you are a little older she would recommend you to her company. She said that, although there were other girls here who are as quick and intelligent as you are, they have not yet learned the true dignity of simple dress and actions."

"You noticed that Miss Lane sold both to our wealthier customers and to our poorer ones. They all liked to buy of her; they hated to see her leave; they stopped at first to see her demonstrate, and afterwards because she had won their respect and confidence—all because she had dignity, the quiet, substantial kind. That's what makes for success, Mary."

That night Mary again talked to her mother. "I love it," she said, giving her plain, linen blouse an affectionate pat and her plain, black skirt a caressing look, "but not nearly so much as I do you, for teaching me to dress this way and just making me do it, when I wasn't an apt pupil. And now I'm ready to take your entire course in dignity and simplicity. After that I believe I'll be ready for Baer's."

OLD TIME SOUTHERN RECIPES

By Mrs. G. W. Squire

Virginia Fried Chicken

Cut up two fryers, salt, pepper, and roll heavily in flour. Brown in bacon grease or butter and lard, add one pint hot water, one-half an onion sliced, two green peppers seeded, and let simmer till tender. Pour the gravy into the platter around the chicken. (This is fine put to simmer in a fireless cooker).

Mammy's Chicken Stew

Cover with cold water one young chicken, two slices of bacon cut up, four sliced potatoes, four sliced tomatoes, one sliced onion, one tablespoon sugar, with pepper, salt, cayenne or green peppers to taste. Boil gently one hour, or even two, stirring often. Twenty minutes before dinner, add corn from five cobs, four more diced potatoes; add three-fourths cup of cream at the dinner hour and thicken with flour.

The Post's Corn Bread

One cup white flour, sifted with one-half teaspoon salt and two heaping teaspoons baking powder, two cups of corn meal, four tablespoons sugar, two tablespoons melted butter or other oil, two cups milk and three eggs beaten very light. (Not the most economical but the very best recipe I ever used. Much praised).

Southern Lettuce

Cut up with the lettuce a very small

New Lamp Burns 94% Air Beats Electric or Gas

A new oil lamp that gives an amazingly brilliant, soft, white light, even better than gas or electricity, has been tested by the U. S. Government and 35 leading universities and found to be superior to 10 ordinary oil lamps. It burns without odor, smoke or noise—no pumping up, is simple, clean, safe. Burns 94% air and 6% common kerosene (coal-oil).

The inventor, V. S. Johnson, 31 N. Fifth St., Portland, Ore., is offering to send a lamp on 10 days' FREE trial, or even to give one FREE to the first user in each locality who will help him introduce it. Write him today for full particulars. Also ask him to explain how you can get the agency, and without experience or money make \$250 to \$500 per month.

SALE OF WOOL EMBROIDERED SERGE DRESSES \$3.88

Newest Parisian Style

Don't miss this amazing bargain! Only a few of these stunning style, fine quality Serge Dresses to go at this sensationally low price. Fashioned from extra quality Serge; always looks nice and gives excellent wear. WONDERFUL CONFIDENCE

Many charged with the care of children, turn instinctively to

Scott's Emulsion

as a dependable means of sustaining growth and vitality. You could not do better than profit by this confidence.

Scott & Bowne, Bloomfield, N.J.

Take KI-MOIDS for Indigestion.

ADAMS PIPE WORKS

New and second hand pipe and casings. Riveted steel pipe, valves and fittings. Mail orders given prompt attention. Write, phone or call.

2025 Bay St., Los Angeles, Cal.

bit of onion, salt it, and when ready to serve toss it in the salad bowl with equal parts of vinegar and hot bacon grease.

Davison Ginger Bread

One cup black molasses, one-half cup sugar, one cup hot water with one rounded tablespoon of butter or lard put to melt in it, two eggs well beaten, one teaspoon each of ginger and cinnamon and soda (level) sifted with the flour, and enough flour to make batter a little thinner than usual cake dough. Beat. And do not over bake. Have oven as for loaf cake. Serve with this either a glass of milk to drink or the following apple sauce with raisins.

Crystal Apple Sauce

Slice six apples and put in buttered casserole or baking pan with one cup washed raisins. Pour over this one cup hot water and one cup cane syrup and bake. If apples are very sour use more syrup and less water.

SOME "DIFFERENT" RECIPES, BUT THE BEST EVER

By Mrs. Clarence Dougherty

Charm Toast

Toast nut bread on one side only. Butter untoasted side and spread with brown sugar. Sprinkle a little cinnamon on top and set in oven until sugar is melted. Serve at once.

Spiced Walnuts

1 cup sugar, $\frac{1}{4}$ cup water; boil until a little dropped in cold water becomes brittle. Remove from fire and add $\frac{3}{4}$ teaspoon cinnamon and stir in quickly 2 cups walnuts (as large pieces as possible). Each piece of nut becomes coated with sugar. They make very nice confection for after dinner.

Fruit Cookies

$1\frac{1}{2}$ cups sugar, 1 cup butter, 3 eggs. Cream together well. 1 teaspoon soda in 1-3 cup hot water; 1-3 teaspoon salt, 1 teaspoon cinnamon, $3\frac{1}{2}$ cups flour, 1 cup walnuts (broken), 1 cup raisins (chopped), $\frac{1}{2}$ cup currants (or seedless raisins), 2 tablespoons molasses. Drop on greased tins, three inches apart (about a heaping teaspoon). Do not bake in too hot an oven. Coconut or chocolate may be added. If so, add $\frac{1}{2}$ cup more flour and a little water.

Chocolate Nougat Layer Cake

Two cups brown sugar (very light color, or 1 white and 1 brown), $\frac{1}{2}$ cup shortening, 1 cup sweet milk, 1 teaspoon soda (scant), $\frac{3}{4}$ cup chocolate (sweet), 2 cups flour (sifted), $\frac{1}{2}$ teaspoon salt, 1 teaspoon vanilla, 3 eggs. Mix in usual way. Use either white or brown chocolate frosting. Very nice to make a two layer cake with a chocolate cream filling and chocolate icing.

Jam Cake

1 cup sugar, $\frac{1}{2}$ cup butter, $\frac{1}{2}$ cup buttermilk, 1 teaspoon baking powder, 2 eggs (beaten separately), 2 heaping cups flour, 1 small teaspoon soda dissolved in milk, $\frac{1}{4}$ teaspoon cloves, pinch salt, 1 teaspoon cinnamon, 1 teaspoon nutmeg, $1\frac{1}{2}$ cups jam (I prefer Satsuma jam). Cream butter and sugar well. Add eggs, creaming thoroughly. Mix spices, baking powder and flavor, adding alternately with milk and soda; lastly fold in jam. If jam very rich, skimp proportion. Cover with any simple icing if desired.

Honey Cake

4 eggs, 2 cups brown sugar stirred very light. Add 3 tablespoons chocolate, 1 tablespoon cinnamon, 1 teaspoon cloves, $\frac{1}{4}$ teaspoon allspice, $\frac{1}{2}$ teaspoon chopped almonds, 1 cup honey, $2\frac{1}{2}$ cups flour, 2 teaspoons baking powder. Bake in moderate oven 20 minutes.

Frosting—1 cup sugar, $\frac{1}{2}$ cup water. Boil frosting until a little dropped on cake turns whitish (about 20 minutes). This frosting looks like ice.

TO IRON PLAITS

The home laundress will find the ironing problem greatly lessened if, after pressing each plait in exact place it is clinched through the two under thicknesses by one of the little "spring" clothes pins. Each plait will hold its place firmly while the others are being ironed, and when the skirt is ready for the clothes frame, it will not have the loose, mussed appearance so often noticed from handling over the ironing board.

MAKING SAUSAGE

Trimnings and pieces of meat which otherwise might be wasted may be converted into some form of sausage. Sausage making is a trade well worth learning. Often on the farm when animals are butchered for home consumption portions of the carcass are not utilized to the best advantage. A demand for fresh and smoked country sausage always exists, and it is just as important for every farmer to know how to make good sausage as it is to know how to make good hams and bacon.

The only equipment necessary to make sausage is a meat cutter with a stuffer attachment. A knife, cord string, and casings or muslin bags also will be needed. Muslin bags can be made of any size, but the most convenient are 12 inches long by 2 inches in diameter. When sausage is stuffed in muslin bags they should be paraffined after stuffing. Sausage stuffed in muslin bags and paraffined keeps longer and better than in casings. Sausage will keep very well in stone crocks or tin pans if a layer of hot lard or paraffin is poured over the top.

Pure Pork Sausage

Good pork sausage may be made as follows: 65 pounds fresh lean meat, 35 pounds fat, $1\frac{3}{4}$ pounds salt, 2 ounces fine sage, 1 ounce ground nutmeg, 4 ounces black pepper.

Cut the meat into small pieces, mix and add the spices, and then put through the grinder, using the small plate. After it is well ground, mix thoroughly to be sure that it is uniformly seasoned. No water should be added if the sausage is to be stored away in bulk. If it is to be stuffed in casings a little water may be necessary to soften the meat so that it will slip easily into the casings.

Smoked or Country Sausage

The following ingredients are used in making smoked or country sausage:

85 pounds lean pork, 15 pounds beef, $1\frac{1}{2}$ or 2 pounds salt, 4 ounces black pepper, 1 ounce red pepper, 1 ounce sweet marjoram, 1 ounce mace.

Cut the meat into small pieces and sprinkle seasoning over it, then run it through the grinder, using the small plate. Put it away in a cool place for from 24 to 36 hours, then add a little water and stuff into hog casings and smoke in a very cool smoke until a dark mahogany color is obtained.

Frankfurt or Vienna Sausage

Frankfurt or Vienna style sausage is more popular with the manufacturers and the trade than any other kind. It is made as follows:

70 pounds beef, 30 pounds pork (not too lean), 20 pounds water, $1\frac{1}{2}$ or 2 pounds salt, 2 ounces nutmeg, $\frac{1}{4}$ ounce black pepper, 1 or 2 ounces red pepper.

Cut the beef into small pieces, salt it, and allow it to cure for 48 hours in a cool place. Cut the pork into small pieces and put the beef and pork through the grinder together. Put into a container and add the water and spices. After it is all mixed put it through the grinder again, using the fine plate. Stuff into sheep casings. After the sausage is stuffed into the casings by means of the thumb and forefinger, press the casing together at about four inch intervals. Twist the first link two or three times. The next link made should be twisted in the opposite direction to keep the casing from untwisting. After it is twisted into links, hang it in the smokehouse for about two hours at a temperature not to exceed 125 degrees Fahrenheit. After it is smoked, boil it for 5 or 10 minutes; then plunge it into cold water and hang it in a cool place.

Bologna Style Sausage

Bologna style sausage is used extensively for lunches or picnics or outings. Its keeping qualities are excellent. The following ingredients are used in making it: 60 pounds cured beef, 40 pounds pork, 20 pounds water, $1\frac{1}{2}$ or 2 pounds salt, 2 ounces mace, 1 ounce coriander, 4 ounces black pepper.

Grind the beef and let it cure for 24 hours in a cool place, then grind it very fine. (Beef should be ground, salt and seasoning added, and the bulk stored away for from 24 to 48 hours before using it for sausage. Fresh meat stuffed into casings and smoked invariably spoils.) Put the pork through the grinder, using the medium plate. Then put the beef and pork to-

Had Your Iron Today?

The Luscious Dish That Keeps You Fit

When Your Usual Exercise is Lacking

Sun-Maid Raisin Bread

Next time you bake bread make a loaf like this with Sun-Maid Raisins, and try it on your men folks.

Raisin Bread

3 cups flour, 4 teaspoons baking powder, 1 teaspoon salt, $\frac{3}{4}$ cup sugar, 1 cup Sun-Maid seeded raisins cut in pieces, 1 egg, 1 cup milk.

Soak raisins in boiling water for 15 minutes. Drain and dry. Sift flour, baking powder, salt and sugar together. Add raisins. Mix beaten egg with milk and add to flour, stirring constantly. Pour into greased bread pans. Let stand for 10 minutes and bake in moderate oven for 40 to 45 minutes.

This makes two small loaves or one large loaf.

All measurements for this recipe are level.

Red package (Seedless), best for stewing.

HERE'S a luscious dish to help you to keep well when there's less work and more leisure on the farm, and the old foe "inactivity" causes trouble.

Exercise is the best way, but *delicious* raisins, stewed and served with cream, is also a *natural method* of keeping the body in good trim. You'll want them every morning as your regular breakfast dish, for their luscious flavor alone.

It's the raisin's practically predigested sugar and the *bulk* and roughage of the skins that make it an effective food. So this isn't any *notion* about raisins. Great sanitariums serve stewed raisins because they know these facts.

Merely try the raisins for a week or two, and you can prove them for yourself.

Food-Iron, Too

Remember, too, that raisins are rich in food-iron, which the blood needs to maintain vitality and strength. So in eating luscious raisins, which you like, you eat one of the greatest *health foods* known.

SUN-MAID RAISINS

Always ask for Sun-Maid Raisins, made from California's finest table grapes, yet costing no more than ordinary raisins. Seeded, blue package (seeds removed) best for pie and bread; Seedless, red package (grown without seeds) best for stewing; Clusters (on the stem), a luscious, quick dessert.

Raisins are 30% cheaper than formerly. See that you get plenty in your foods.

FREE BOOK

Send the coupon and we'll mail you more than 100 tested recipes for raisin foods in a valuable free book. Send for it now.

gether into a container and add the spices and water. Mix thoroughly until it takes on a dull color and becomes sticky. Stuff into weasands, large beef casings, or in beef rounds. This sausage can also be stuffed into muslin bags and paraffined. It will keep perfectly prepared in this way. Allow it to hang about 20 minutes in a cool place. Smoke for about two hours, or until a good color is obtained, at a temperature not to exceed 140 degrees Fahrenheit. After the bologna is smoked it should be cooked, the weasands and rounds about 30 minutes, and the larger bolognas about one and a half hours, at a temperature of 160 degrees Fahrenheit. To tell when bologna is cooked enough, squeeze it in the hand, and if done it will squeak when the pressure is released. Place in cold water for about 30 minutes and then hang it up in a cool place to keep.

HINTS FROM HOUSEKEEPERS

Grape Pie—White Cookies

Sometime ago I read in your household department a recipe for grape pie and the contributor asked if any reader had one she liked better to send it to your paper. In answer to this I am sending a recipe in which rhubarb, currants, gooseberries or grapes may be used.

Grape Pie

Cook together 1½ cups grapes, 1 cup sugar, ¼ cup water, 1 tablespoon flour and the yolk of 2 eggs and pour into a baked crust. Make meringue of whites and put on top.

White Cookies

1½ cups white sugar and 1 cup shortening creamed together. Add ½ cup sour cream, 2 eggs, ½ teaspoon soda, 2 teaspoons baking powder, 1 teaspoon vanilla and flour to roll. Roll in sugar and bake in quick oven. This makes a rich, flaky cooky.

I have read your household pages for years and have found many useful articles.—Mrs. Walter A. Carr, Hemet.

Apple Dumplings

I notice in December 31st Cultivator that Subscriber, San Fernando, would like some recipes, so I send one which is an heirloom in my family and always "tastes like more."

Apple Dumplings.—Make a rich baking powder dough (same as for biscuits) stiff enough to roll out like pie crust. Roll out about as large as a small plate or large saucer, as many as you wish dumplings. Slice tart apples and place enough on each piece of dough to make a nice "fat" dumpling when edges are wrapped up and pinched together so they will keep their shape while cooking. Place them in a deep baking dish, put a small piece of butter on each one, sprinkle with cinnamon. Add one cup of sugar for six dumplings. Be sure some sugar stays on top of each. Let the rest fall in the dish between them. Pour boiling water inside dish till it is nearly full, leaving enough space at top so it will not run over while baking. Bake in hot oven about 20 minutes or until they test done with straw and are nicely brown on top.

Serve hot, using the sweet syrup in dish as sauce.—Another Subscriber.

HOUSEHOLD QUERIES

Italian Salami

I would like to make what they call "Swiss sausage" or "Italian salami," and I don't know how much I should use of pork meat with beef, and also in measuring out the spices and liquor. I thought of the Cultivator and so I am writing to ask you if you or some kind reader could help me. I stopped at a friend's home and they had made some, which they said would last them for months and months. I would be glad to help you or someone in return for the correct recipe.—Subscriber, Lompoc.

We do not have at hand recipe for salami but may be able to obtain it later. If so, it will appear in this department. Meanwhile here is one for summer sausage which is similar to the salami:

25 pounds cured beef free from sinews, 15 pounds pork with trimmings, 6 ounces white pepper, 1 ounce whole black pepper, 1 ounce whole mustard seed.

This sausage can be made only in cold weather. All the meat is put through the grinder and spices added. No salt is needed, the cured beef being

salty enough. Mix it all thoroughly until it is evenly seasoned. Spread it out in a cool place and leave it for 36 to 40 hours. Then stuff it into hog bung casings and let hang over night. Smoke over very cool smoke for several days. This sausage can be kept in a dry place the year round. If it gets moldy, simply wipe off the mold before using it.

We hope that some of our readers may be able to supply the salami recipe and we will all appreciate hearing from the Lompoc subscriber with some of her favorite recipes.

Hand Knitting Machine

Have been a reader of your valuable paper for a number of years and always read the items in the query department with pleasure. I would like to ask you or some of the Cultivator readers what you know of the hand knitting machine for wool socks and ladies hose? Are they a complicated machine? Do they do first class work, and about how long does it take to complete a pair of socks or ladies hose? Any information regarding the above will be gladly received.—Subscriber, Visalia.

Can any of our readers give help to this inquirer?

RIPE OLIVES IN COMBINATION

Olive and Egg Cutlets

Four tablespoons fat, 4 tablespoons flour, 1½ cups milk, 2 egg yolks, 4 tablespoons chopped green pepper, 4 hard cooked eggs, chopped, ½ cup minced ripe olives, salt and pepper.

Make a white sauce of the fat, flour, milk and seasonings. When partially cooled add the slightly beaten yolks and remaining ingredients. Cook in double boiler until very thick. Spread on platter to cool and when cold shape into cutlets. Dip in beaten egg and then in fine bread crumbs. Saute in hot fat. Serve with tomato sauce. (Sufficient for four servings).

Olive and Oyster Roast

One pint oysters, ½ cup oyster liquor, ½ cup milk, 2 cups cracker crumbs, 1 cup cooked celery, ½ cup minced ripe olives, 4 tablespoons fat, salt and pepper.

Put layer of cracker crumbs into a buttered baking dish, then a layer of oysters, celery and olives. Season. Dot over with butter. Repeat until all ingredients have been used. Pour over liquids. Bake in a moderate oven 20 minutes.

Macaroni and Olives

Two cups macaroni, broken into 1-inch pieces, 1 tablespoon flour, 1½ cups milk, 1 tablespoon fat, 1 teaspoon mustard, 1 teaspoon salt, ½ cup minced ripe olives, ½ cup chopped cheese, ½ cup cooked green peppers, chopped, 2 tablespoons chopped pimentos, ¼ cup buttered crumbs, pepper.

Cook macaroni in boiling salted water until tender. Drain. Make a white sauce of the fat, flour, milk and seasonings. Add chopped pepper and cheese and cook slowly until cheese is melted. Put a layer of macaroni into a buttered baking dish, then a layer of cheese mixture and olives. Repeat until ingredients have all been used. Cover with buttered crumbs and bake in a moderate oven 20 minutes.

1¼ cup raw rice may be substituted for the 2 cups of uncooked macaroni. Cook in double boiler the 1¼ cup of raw rice in 4 cups boiling salt water.

Cheese and Olive Roast

Four cups stale bread crumbs, 3 cups tomatoes, ½ cup minced ripe olives, 1 cup cheese, chopped, ¼ cup finely chopped onions, 2 tablespoons olive oil, 1 teaspoon salt, pepper.

Brown onion in oil. Add tomatoes and seasonings and cook ten minutes. Add cheese and cook slowly until cheese is melted. Put crumbs, tomato mixture and olives in layers into a buttered baking dish and bake in a moderate oven 20 minutes.

Creamed Lobster and Olives

Three tablespoons fat, 3 tablespoons flour, 1½ cups rich milk or cream, ¼ cup minced ripe olives, 1 cup shredded lobster meat, few drops onion juice.

Make white sauce of the first three ingredients. Add lobster and olives. Season with salt, pepper and cayenne to taste. Serve in patty cases or pepper cups or on rounds of buttered toast.

Crab meat or parboiled sweetbreads

may be used instead of the lobster.

Chicken Marengo

Cut up a five-pound chicken, salt and fry until brown in one-half cup olive oil. Remove chicken and in the fat fry two cloves of garlic, thinly sliced, and one thinly sliced onion; add 2 tablespoons flour and brown.

To this add two cups tomatoes, two cups boiling water, 1 teaspoon salt, 1 tablespoon paprika and ½ teaspoon pepper.

When slightly thickened pour over chicken. Cover and cook slowly until chicken is tender. When half done add ½ cup ripe olives cut in small pieces.

This may be cooked in a casserole. Last half hour of cooking is done with cover removed. (Sufficient for eight servings).

Olive and Tomato Sauce

Three tablespoons flour, 3 tablespoons fat, 2 cups tomatoes, 1 tablespoon minced onion, ½ cup minced ripe olives, 1 cup Brown stock (beef cube), 1 tablespoon chopped parsley, 2 cloves, salt and pepper.

Cook tomatoes, onion and seasoning 15 minutes, then rub through a sieve. Melt the fat, add the flour and the brown stock gradually. Cook five minutes then add olives and strained tomatoes.

He Smokes Meat Without a Fire

Washington Farmer Simply Applies Liquid Smoke—Flavor Is Improved and All Shrinkage Prevented.

Victor Hillhouse of Conconully, Wash., smokes meat by simply painting it with Wright's Smoke.

"I am convinced that it is the only system of smoking meat," says Mr. Hillhouse. "No more of the smoke house way for me. I wouldn't be without Wright's Smoke if it cost \$10."

Thousands have found that the Wright method improves the flavor, keeps meat sweet and free from insects and prevents all shrinkage. Wright's Ham Pickle, mixed with salt, sugar-cures meat to perfection.

Get these genuine, guaranteed Wright Pure Food Products from your dealer.

Simply send your name to E. H. Wright Co., 841-C Broadway, Kansas City, Mo., for valuable illustrated book on expert methods of curing meat. Also learn how you can get a complete, highest-grade butchering set at lowest factory cost.

Questions and Answers

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Japanese Walnuts

Can you tell me where I may procure Japanese walnuts? I should like to grow some trees from seeds.—Subscriber, Elsinore.

Dealers inform us that on account of inadaptability to California conditions the Japanese walnut is not grown here and that an importation of nuts from Japan at present would have to be under a special permit of the federal quarantine board. Years ago some Japanese walnuts were planted in California and unless one of these trees could be found we fear the chances of getting nuts is remote.

Getting the Hawks

In a copy of the Cultivator I read an item regarding hawks getting chickens and your recommendation of wire, which I consider good, as it keeps the hawks out and the chickens in. As not everyone can afford wiring a chicken pen all around and overhead, will offer method sure to get the hawks.

Feed the chickens nux vomica in their mash occasionally, about a tablespoon to two or three quarts of mash (wet). Any hawk that eats from a nux vomica fed chicken will be sure to die. It kills hawks but is not injurious to humans. About twice a week, two or three times a year, is about all it will take to do the work.—A. F. Schenken, Chico.

Maybe this would prove effective, but it appears to us that between buying nux vomica and feeding the chickens to the hawks it would prove more expensive than wire.

Darnel or Ray Grass

A few years ago I received this grass seed in my seed oats. I should like to know the name of it. I believe it is a weed. If it is a weed, I would like to know how to get rid of it, for the plant multiplies very fast.—Subscriber, Miranda.

Your weed is darnel or ray grass. It is of some value for feed but is not a good pasture grass. The species seems to be *Lolium multiflorum*, though the material sent is not sufficient for determination of many grasses. Leaves and part of stalk is often necessary. We know of no way of getting rid of it other than that usually employed for other weeds.

Sudan Grass

When should Sudan grass be cut to make the best feed?—Subscriber, Fullerton.

The best time at which to cut Sudan grass is still a debatable question among growers, but the majority are agreed that when the flowers are showing well it is in good condition, and chemical analyses show that it is then of greatest nutritive value. Of course the time cannot be fixed on the calendar as it is so elastic under various care and climatic conditions.

Pruning Himalaya

How and when should Himalaya blackberries be pruned?—Subscriber, Upland.

The Himalaya blackberry is such a strong grower that it seems to make little difference how it is pruned; a good time is at present. Himalayas unpruned, having vines 40 feet long, have borne good crops when grown on fences, trellises, arbors, etc. Success with crop does not seem to depend on pruning. For commercial

purposes it is perhaps best to cut back to four or five canes of last year's growth to four or five feet long and the laterals on these to one foot long. Cut the rest, including all old or last year's canes, entirely away and as close to the roots as possible.

Nematodes

Will you please tell me if asparagus roots and grape fruit trees are immune to nematodes.—An Old Subscriber.

Unfortunately, no. Both are attacked by this pest.

Tanning Cowhide

Would you please explain in your next issue how to tan cowhide for leather.—Subscriber, Orange.

On another page may be seen hints in this matter of tanning skins. However, wishing more complete information we have applied to the department of agriculture at Washington to aid us and are hoping to have some further suggestions in a later issue.

SEED LOANS IN NORTHWEST

In the face of another unfavorable crop year farmers of the Northwest are gradually repaying the government the loans for seed advanced them early this year as an emergency measure made necessary by three years of total or partial crop failure in drouth stricken areas. Total collections up to November 15 amounted to \$286,000, according to returns reported by representatives of the United States department of agriculture, who are handling the work at the temporary field office established for the purpose at Grand Forks, North Dakota.

Within 20 days after the passage of the act the department had perfected an organization and began to make loans to farmers. In return the farmers gave promissory notes on the crops to be grown from the seed, payable November 1. Early in October repayments began coming in, and the work of collecting the loans has gone steadily forward since, in spite of the fact that the farmers are in but little better position now than they were last year. The crops have been only fair this year, with partial failures in many places, and as a result the borrowers are in financial straits again.

POTATO EXPERIMENTS

The value of systematic selection is instanced by the results of an experiment recently carried out by the agricultural department of New South Wales. Thirteen selections were planted, all except two of these being made simply on the appearance of the tubers, and the two exceptions comprising second growth tubers broken from large potatoes. The advantages claimed for this type of seed were that the tubers were immature and were the progeny of potatoes of strong vitality, both of which are essential points in the reproductive quality of seed potatoes.

This argument the results amply justified. The two highest yields were obtained from the second growth immature seed, the winning yield being at the rate of four tons per acre. The best yield obtained from seed selected by growers from their ordinary stock only totaled two tons nine hundredweight.

CITRUS EXPERT FOR THE UNION

R. E. Nebelung, formerly county agent in California, who has been engaged by the government of the Union of South Africa to supervise citrus growing, spent some time in examining the market conditions in London and says that what he has already seen convinces him that "right here you have probably the greatest market for citrus fruit in the world. Any fruit growing country making a special study of the London market's requirements is bound to reap big returns."

What It Means to be a Pelton Dealer

THE MAN who handles Pelton pumps must do more than simply carry a few pumps and parts in stock and be ready to order others from the manufacturer. It isn't nearly so easy as that. He must be both able and willing to give real service to the water user, to see not only that he gets the type and size of pump best suited to his needs but also that he gets the best results when the pump is installed, and in the rare event of anything going wrong, to see that replacements or repairs are made in the shortest possible time.

PELTON DEALERS are a selected group of men, acquainted with irrigation requirements in their respective localities, and able to help water users in the solution of their problems. Working in co-operation with our dealers are the Pelton field representatives, who devote their time to traveling and advising with dealers and pump users, and finally there are the sales engineers and designers at the San Francisco office, the three together forming the co-ordinated body of Pelton Service.

WE WOULD like to have you get acquainted with all three branches of Pelton Service and suggest that, for a start, you call upon the Pelton dealer in your territory. For the benefit of those who do not yet realize how completely Pelton Service covers the irrigated districts of California we will publish in the Cultivator for January 28th a list of Pelton dealers. In the meantime, if you do not know the name of your nearest dealer, let us know, and we will be glad to tell you. Whether you are in the market for a pump or not, you will find your Pelton dealer a man worth knowing.

Evolving Better Range Cattle

RADUALLY the margin of profit from range cattle operations in this state is narrowing. Range values and leases, labor, cost of money, and all the other charges that enter into the cost of producing cattle have constantly increased to a point out of all proportion to selling prices, and the majority of cattle outfits are being hard put to make both ends meet. At the same time there is not much evidence to indicate any speedy improvement in the general situation. Range values are not expected to decline materially, although rentals and leases have shown an inclination to reach lower levels. Labor has receded quite a bit from the peak point but is not expected to get much nearer pre-war levels. Interest rates will show considerable improvement during the coming year, and will sooner or later get back to normal. As to what the future holds in the way of markets no one cares to venture an opinion. All of which emphasizes the absolute necessity for California range interests to evolve a better class of cattle if they expect to continue in business. The possibilities along the line of better cattle are tremendous in this state, and as yet mighty little has been done save in comparatively few isolated herds. California is behind the Northwest and Southwest in the quality of our cattle, and it cannot be expected that we can meet that competition without producing a class of cattle comparable to that smashing the markets from those sections.

The problem of improving the general average of our cattle stock resolves itself to the simple and fundamental matter of using a better class of bulls than are now found on our ranges. No good fairy is going to wave a wand, and neither is a beneficent Providence going to turn the trick while cattle owners sit on the top rail of the home corral and spend the time cussing the packers—even though the latter may need the cussing. We have simply to face the problem, "cold turkey." It can be done. A few California range operators have demonstrated that a year or more can

be cut off the selling age of these steers and that the weight can be increased very materially through the use of well bred bulls. What these progressive men have accomplished others can duplicate—but it's a matter of individual concern.

First of all, a lot of our range men need to discard the idea that a hundred or half again as much is enough to pay for a bull. Sometimes a good bull can be bought cheap, but one shouldn't buy bulls on the basis of cheapness—buy on the basis of correct beef making type and quality. This last point—buying on the basis of correct beef making type and quality—cuts too small a figure in the average man's buying. Apparently all some cattlemen want is a bull—usually a red one—and about all they expect of a bull is that he get their cows in calf. Such men do not look to a bull as a means of improving the type and quality of their calves, and as a consequence their cattle show little or no improvement from year to year. It is such men who are usually found decrying the cattle business in general and blaming their lack of profits on the packers.

There may have been some justification for the sort of bulls used on California ranges in years past, when there were but few breeding herds in this state to furnish well bred bulls, but there is little excuse now that the leading breeds are well represented by many herds that are the equal of any. California range men can now fill their needs within this state, and they will find our breeders producing a class of cattle that cannot fail to work improvement in our range stocks.

An opportunity to secure good bulls will be offered next month when both the Hereford and Shorthorn associations will hold their annual spring sales at the university farm, Davis. Each association plans to offer bulls of useful ages in lots of five or more—up to a carload.

Advantage should be taken of these sales, and every bull offered should find its way to the ranges of this state.—R. P. R.

Putting the Loss on the Producer

By A. L. Spellmeyer.

THE cattlemen have had entirely in mind the price the consumer pays, but the time for that is past when it has come to the question of a survival of the cattleman himself. The bogey behind this has been the idea that the consumer was quitting the use of meat. Let us analyze the facts we have of numbers and supply, slaughter and inspection. In the figures compiled by governmental sources we have estimates and we have actual counts and records. The census is a count and federal inspection is a record. Slaughter is a record. When estimates conflict with counts and records we cannot consider them but must take the count.

Other Than Dairy Cattle

Census 1900, 50,585,777; 1910, 41,178,434; 1920, 35,424,458. Government guess 1900, 27,610,000; 1910, 47,279,000; 1920, 44,750,000; 1921, 42,870,000. According to census cattle decline in 20 years in the United States, 15,000,000.

Total slaughter (John Roberts report bureau animal industry), typical years only are chosen to cut bulk figures: 1907, 13,469,900 cattle, 6,026,800 calves; 1914, 11,004,500 cattle, 4,661,400 calves; 1918, 15,750,400 cattle, 7,767,200 calves; 1920, 12,176,400 cattle, 9,662,800 calves.

The first eight months of 1921, on which I have complete figures, are verified by last two months, but I will give you the proportion of how 1921

is holding up in meat slaughter as compared to 1920. Necessarily the figures are from federal inspection to which, however, all slaughter conforms: 10 per cent decline in cattle in 1921 as to 1920; 5 per cent decline in calves; nogs even; 20 per cent increase in lambs and sheep.

While the per capita pounds of meat consumed are less bulk volume of cattle numbers slaughtered have shown no alarming decrease in meat. Considering the hard times it shows a bulk increase.

As compared to the slaughter of 1915 in cattle the bulk kill shows increased numbers roughly as follows: 10 per cent minimum increase in 1921 in cattle killed as to 1915; 85 minimum increase in calves.

1915 was a light year, but this year of 1921 we are killing more cattle than in 1915 and about double the calves. You can check up the total slaughter of cattle and calves for any year from 1907 to 1916 inclusive and we are killing more cattle in 1921 than they killed then.

This country lost some 15,000,000 of its beef cattle on a slaughter average under 19,000,000 cattle and calves. This year's slaughter will total over 20,000,000 and according to census returns we have 30 per cent less cattle to stand it. This dairy increase since 1900 amounts to 5,000,900 head in the government guess. It did not prevent us falling behind. If it is 10,000,000 dairy increase it won't prevent the decrease of 2,000,000 cattle for the next year when the government finishes estimates. If you know the ranges of the West you know without any doubt as to tremendous depletion and liquidation, and that slaughter has only been upheld through the sacrifice of breeding cows for the last two years or more.

When any man goes into this ques-

Her Comfort is Your Gain

To neglect any discomfort of the udder or teats is costly. The slightest

soreness or abnormal condition makes the cow restless and reduces the flow of milk.

Cuts, Chaps, Scratches, any congestion or inflammation can be quickly cleared up by using Bag Balm, the great healing ointment for cows. Caked Bag is promptly reduced by this softening remedy. A great aid in treating Bunches and Cow Pox.

Bag Balm, in the liberal 60c package, is inexpensive insurance against serious troubles. Keep a package on hand. Sold by general stores, feed dealers and druggists. Booklet, "Dairy Wrinkles," Free.

W. F. YOUNG, Inc., 244 Temple St., Springfield, Mass.

The Cultivator costs only one dollar yearly

tion that I am going to open up of packers' margins and retailers' profits he is asking for an argument, unless he deals with it from positive facts, and that must necessarily be in a local spirit. Recently the cattle loan and packing house conversation in Los Angeles aroused no enthusiasm in me because I knew what they were up against. I knew no two per cent could save some of them, and that the overhead was what was hurting. I knew the banks were afraid, not so much of first loans as of later advances, and that the cow men who were hard up were the ones whose outfits could pay out as the banks had to carry the ones that could not. I also knew that competition against the present killers, packers or independents, was no easy job and that all margins were rather close on cattle at present.

The packers' list in Los Angeles today, December 28, is: No. 1 steers, 12½; No. 1 cows, 11½. The actual prices I have seen in repeated instances on bills are: Steer carcass, 10.50 to 11½; cow carcass, 9.50 to 10. I could have topped coolers for 11½ steers and 10 cent button heifers in several plants. Here at least there is a severe and deadly effort for volume kill.

On test I killed steers that averaged me \$6 for hide and offal and it cost ¼ to ½ a cent for delivery and ½ a cent to sell. Therefore, without interest on investment a 1200 pound steer, shrunk, at 6 cents live weight could sell at 10½ carcass, but considering interest, etc., 11 to 11½ is close. It cost me \$1.50 for killing, the killer taking the waste offal and the hide and edible offal, netting \$6 on a large steer.

Packer's profit margins vary all the time and everywhere, on the steer, the lamb or the hog.

For instance, hogs have made several trips up and several down this year. When they go down the vats load up. When they rise people hold back for the permanent raise they expect, and not so many come in. The bacon and ham gets ready about the time of the rise after a drop, and so it goes. One killer here cleaned up nicely on lambs he bought 60 days ago at 5 cents and is selling today at 20 cents carcass price.

At the same time cattle were selling somewhat on this basis: My shrink on weighed off cars is about right: Producer—6 cents for a 1200 pound steer shrunk to the tissue, or \$72; actual loss about \$30 per head.

Packer—700 pound meat at 11½ and \$6 hide and offal, or \$89.50 or \$17.50 gross profit.

Retailer—700 pound meat, \$140.

However at same period other cattle made returns that cut it close.

Steers costing (1200 pounds) \$84 selling at 11 cents or \$77 plus \$6 hide and offal, \$83, and losing the packer money. It's not all cream. A \$12 gross on a steer is usually a nice packer margin these days, and it's doubtful if a large packer can clear for less, so these hog and lamb plays are necessary for the profit, limousines and diamonds.

Also, these big lawyers and politicians don't work for glory, and support by the financial strongholds is costing about 9 per cent interest rate.

Some men were misled into shipping here through a high quoted 7 cent price for fat steers. It was only paid so far in a few isolated instances, and while 8 cents would surprise no one here by February 1, beef sells from 6 to 6.50 now and some at less. Los Angeles is getting to be quite a market and things appear corking up for killers as grass is late, but all depends upon other markets and ability to ship in.

Packers went to Idaho, Wyoming, Montana, Kansas and Texas this year to supply Los Angeles, leaving fat cattle sweat it out for a 6 to 6.50 price here when the imports often cost 7 cents. Ordinary Northern Arizona grass beef was brought in at 6.50 when California fed steers in small lots sold at 5 to 5.50. The intention was no doubt to safeguard a supply here later.

In conclusion there are some things about the cattle trade that cannot help but cause some serious consideration. What is the end as it's going? Is that change coming to the West that took place in Illinois and Iowa a generation ago? All this talk of cheaper range rentals, etc., is all right applied to forest or government lands, if it can be put over, but on private land is the

veriest bunk. Whether you own or rent land its cost depends upon its value and Western lands are not decreasing. Western land is increasing with millions coming here every year in increased population. It can't help it.

Also there must be evident reason back of the packer low price beef policies, as these are men who know fully what shortage must inevitably mean. One idea may come from knowledge of the great increase of large meat markets and chain markets with fine refrigerator systems and stock and bond control and the fact that some districts of South America can produce a steer for \$4 that would cost us \$64. Those Platte and other plants are in fine shape and a shortage would not hurt packers who own them nor a 2 cent or double that meat duty stop imports. We can't fight a battleship with a leaky rowboat. The success of the Citrus Association shows a proven method of marketing.

LIVESTOCK ASSOCIATION CHOOSES OFFICERS

The first board of directors of the National Livestock Producers' Association met in the Chicago offices of the American farm bureau federation on December 28-30. Officers were elected as follows: President, John G. Brown, Monon, Indiana; vice president, C. E. Collins, Kit Carson, Colorado; secretary-treasurer, E. H. Cunningham, Des Moines, Iowa. The officers constitute the executive committee.

Urgent requests were received to establish terminal commission associations and the allied stocker and feeder companies at Chicago, Indianapolis, Pittsburgh, Cleveland, Buffalo, Detroit.

The national board of directors decided to undertake a thorough investigation of the conditions surrounding each market during the next 30 days before authorizing establishment of any terminal commission company. No cooperative company will be established at any terminal before the trade prospects warrant it as a sound business venture. If the board's investigation shows that the business of the market and the attitude of the producers warrant, the association will proceed at once to organize terminal cooperatives.

The Producers' Livestock Commission Association, National Stockyards, Illinois, opened for business January 2. This is the first of the terminal commission associations to be organized.

SOUTHERN CALIFORNIA LIVESTOCK BREEDERS' ASSOCIATION

A number of breeders of pure bred livestock in Southern California, and others who are interested in the success of the industry, recognizing the great need for organized effort, have formed an association known as the Southern California Pure Bred Livestock Association.

The object of this association is to combine in a compact and effective organization those men and institutions engaged in promoting various lines of livestock breeding. Their problems are the same and the benefit of thorough organization will come through a consistent spirit of cooperation. The various phases of the marketing problem can be best handled through organized effort; freight charges and transportation regulations; onerous health and inspection regulations which need adjustment from the standpoint of the breeder; the promotion of the pure bred in all lines of livestock; new legislation and general encouragement of the livestock industry in the South, may be successfully handled through organized and cooperative effort.

In this organization each breed is represented by a prominent breeder on the board of directors and it is the policy to foster in every way breed organizations and breed spirit.

To make this organization a success and the benefit it should be there must be a large and active membership. Everyone in Southern California who is interested in the promotion of the livestock industry should see that his name is written in this organization. The membership fee is \$5.—W. W. Van Pelt, Secretary, Riverside.

"Happy Days! I'll say!"

"MY brothers were fine upstanding youngsters. As for me—I was badly sweetened and nobody gave a hook-joint whether I became a plough-horse or a saw-horse. I WAS swapped around 'till finally I got a regular boss who said, 'Sound as a nut, except that blamed sweeny. We'll soon get rid of that.' And he did with Gombault's Caustic Balsam".

GOMBAULT'S CAUSTIC BALSAM does the work better than firing. Hair will positively grow back natural color.

A positive remedy for Curb, Splint, Sweeney, Capped Hock, Strained Tendons, Founder, Windpuffs, Skin Diseases, Thrush, Spavin, Ringbone, Throat and Bronchial Troubles. Will not scar or blemish. Supercedes all firing and cautery.

Sold by druggists, or sent by parcel post on receipt of price \$1.50 per bottle.

AS A HUMAN LINIMENT It is unsurpassed for muscular and inflammatory rheumatism, sprains, sore throat, burns, bruises, cuts, etc.

No Money Down!

Catalog tells all—write. **Caution!** U. S. Bulletin 201 shows that vibration of the bowl causes cream waste! The Melotte bowl is self-balancing. Positively cannot get out of balance therefore cannot vibrate. Can't remix cream with milk. The Melotte has won 24 Grand and International Prizes.

Catalog FREE

Write for new Melotte catalog containing full description of this wonderful cream separator and the story of M. Jules Melotte, its inventor. Don't buy any separator until you have found out all you can about the Melotte and details of our 16-year guarantee which is infinitely stronger than any separator guarantee. Write TODAY.

The Melotte Separator, H. B. Babson, U. S. Mgr. Dept. 3021, 2843 W. 19th Street, Chicago, Ill.

Runs so easily, bowl spins 25 minutes after you stop cranking unless you apply brake. No other separator needs brake. Bowl chamber is porcelain lined.

Ten Per Cent More Milk

Alanson Swain, manager, Morrison Ranch, Lancaster, Calif., says: "Prior to April, 1920, we had been hand milking and had kept accurate records of the milk production. Since acquiring the Sharples Moto (electric) Milker, the milk production from the same cows, under the same conditions of feed and care, increased slightly more than ten per cent with increase in butter fat." The Morrison Ranch is the home of some of the finest Pure Bred Holstein cattle in the state, where the best of hand milking was obtained. If they can increase production ten per cent, what would the use of the Sharples mean to you?

There is nothing unusual about the above record; it is the direct result of fast and clean milking. The Sharples Moto-Milker milks four quarters at once and two cows at a time. One person, with the Sharples, can milk fifteen or twenty cows per hour. The Joy-Reams Co., 1908 S. Main St., Los Angeles, distributors, have a special illustrated booklet for you. Write them and tell them how many cows you have.

The Mings Sale

The present strength of the market for registered Holsteins in California was clearly in evidence at the T. B. Mings dispersal at El Monte on January 5. This sale marked the beginning of the 1922 sale season following the heaviest selling year in California's Holstein history, as during the past year new buyers had absorbed over 1,500 head of registered Holsteins in the public sales alone. Outside of one cow the Mings herd contains no high record females, and half of the herd was composed of heifers from yearlings down to young calves. The top of the sale was made by the 30 pound cow, Fay Tritomia Hengerveld that fell to the bid of James Edmondson, Los Angeles, at \$1,075. The bred heifers were topped at \$475 by Isabella Korndyke Pontiac Walker, a daughter of King Korndyke Pontiac 20th, going to J. B. Smitson, El Monte.

Marion Hengerveld Pontiac, another daughter of King Korndyke Pontiac 20th, topped the open heifers at \$525, going to L. B. Van Blaricom, El Monte, one of the great bargains of the sale at that figure. Mrs. Perle R. Penrose, Pomona, made a most promising selection in Pauline Pontiac Abbecker Segis, sired by Walter Mitchell's \$5,000 son of the famous Bridgford cow, Adirondac Wietske Dairy Maid. Two choice daughters of Prince Riverside Walker were bought by Charles MacDonald for Anita M. Baldwin at \$600 and \$575, respectively. The offering of 58 females was absorbed by 26 buyers, only about a half dozen established breeders appearing among them. The sale was managed by California Breeders' Sales and Pedigree Company, with Ben A. Rhoades on the auctioneer's block.

Following is the sale summary with individual purchases:

Twenty-seven tuberculin tested females of milking age sold for \$9,815, average \$363; 14 bred heifers sold for \$3,285, average \$234; 13 open heifers and heifer calves sold for \$2,620, average \$201. Four reactors sold for \$695, average \$174. Total sale, 58 head sold for \$16,415, average \$283.

1. Fay Tritomia Hengerveld, May 29, 1913. James Edmondson, Los Angeles, \$1,075.
2. Marion Hengerveld Pontiac, January 20, 1921. L. B. Van Blaricom, El Monte, \$525.
3. Ellen Korndyke Pontiac Hartog, October 2, 1919. J. B. Smitson, El Monte.
4. Queen Korndyke Pontiac Colantha, April 18, 1919. D. L. Wright, Pasadena.
5. Isabelle Korndyke Pontiac Walker, July 5, 1919. J. B. Smitson.

52. Rock Daisy, November 10, 1916. Mark Percy, \$140.
53. Heifer calf, August 4, 1921. Sargent Bros., \$145.
54. Segis Korndyke De Kol Beauty, February 20, 1916. Geo. R. Wilson, \$300.
55. Juliana Walker Segis Pard, June 1, 1920. A. E. Frampton, \$190.
56. Lady Belle Colantha Prilly Pard, February 18, 1920. D. L. Wright, \$365.
57. Segis Prilly Holland Pard, July 15, 1920. F. F. Pellissier, \$220.
58. Virginia Burke Prilly Pard, February 9, 1920. Anita M. Baldwin, \$225.
59. Heifer calf, September 30, 1921. Sargent Bros., \$190.

Livestock as a Sideline

GREAT many California ranchers seem to feel that the matter of producing livestock is best handled as a specialized business.

True it is that when undertaken on an extensive scale the business usually develops into a specialty, but the major production in most states originates on small farms where livestock is merely a sideline—a few cows kept to utilize farm roughage and furnish milk and butter for the home, a few brood sows to consume the waste and furnish delicious home cured hams and bacon and incidentally a load or two of market porkers, and perhaps a little flock of sheep to keep the place free from weeds.

It is under such conditions that livestock farming becomes one of the safest and surest sources of income to the man who is endeavoring to eliminate risk from his yearly operations.

Throughout this state, in every county and every township, there are at least a few ranchers who can very materially increase their income in 1922 by following such a plan as suggested above.

Every condition for reasonable success is present and favorable in California. Our natural conditions for growing all kinds of livestock cannot be excelled. Except in the mountain sections very little expense is required for shelter, the possibility of provid-

ing cheap forage the year around is far greater than in other sections, and finally, our markets usually rule satisfactory.

The management and settlers of the two great land colonies, Durham and Delhi, recognize the importance and possibility of livestock in small farming operations and in each colony the settlers have been encouraged to maintain small herds and flocks. Not long ago the superintendent of one of the colonies told the writer that more than one settler had been able to pull through the disastrous season of 1921 because of his cows and pigs. This same superintendent holds an allotment and practices what he preaches—and he is about as level headed a chap as one will meet.

In making a start with livestock, the sort determined upon should be governed largely by the character of one's farm, the sort of feeds grown, the experiences of one's neighbors and one's personal choice. The prices paid for foundation stock can vary widely and will depend on whether one elects pure breds or grades. If the former, the beginner need not be misled by reputed high prices. Generally speaking, pure bred values have receded from war time levels, and at present are as low as can be reasonably expected. If grades are selected, the beginner should bear in mind that there is a vast difference in quality

and producing ability in grades. Some grades (as well as some some pure breds) are dear at any price. Other grades that have had the benefit of several generations of pure bred sires approach near the pure bred standard. If grade females are selected, by all means install a pure bred sire at the head of the herd or flock or patronize the owner of a pure bred sire.

Once a start is made, determine to make the matter of livestock maintenance a permanent part of your operations. Give your charges good care and be willing to take your profits from the increase over a period of eight years.—R. P. R.

LOS ANGELES COUNTY TESTS

Supervisor L. J. Birge of the Southern Los Angeles County Cow Testing Association reports tests for November and December in following herds:

November

Peter Wilber, 3.78 average per cent fat, 39.1 average pounds fat; Fred De Vries, 4.4, 30.9; J. H. Leahy, 4.75, 39.9; W. Zylstra, 3.8, 37.9; S. W. Bockema, 4.58, 43.2; Joe Telford, 4.31, 39.0; M. Harvie, 4.71, 38.3; Paul Taylor, 3.58, 29.8; Geo. Webb, 4.0, 37.7; J. G. Gains, Jerseys, 6.3, 40.4; Geo. Hight, 4.0, 35.2; Chas. Harrington, 3.68, 37.7; D. H. Dillon, 4.07, 43.6; R. Palmer, 4.29, 30.9; M. A. McClain & Co., 4.15, 34.0; C. V. Harris, 3.51, 43.0; Earl Graham, 4.14, 49.7; Geo. Trail, 3.87, 40.5; Chas. Harrington, highest pounds fat for one cow for December (Holstein pure bred), 91.8; Earl Graham, highest herd average of fat, pure bred Holstein, 49.7; J. G. Gains, highest average herd test, 6.3.

December

Fred De Vries, 4.35 average per cent fat, 42.6 average pounds fat; J. H. Leahy, 4.54, 38.6; J. Tilford, 4.32, 41.1; W. Zylstra, 4.0, 43.0; S. W. Bockema, 4.45, 42.8; G. J. Gains, 5.62, 44.5; Geo. Webb, 4.07, 37.3; Earl Graham, 3.67, 61.0; Peter Wilber, 3.58, 33.9; Paul Taylor, 3.7, 42.0; John Van Ruiten, 4.29, 45.4; R. M. Howie, 4.97, 41.5; D. H. Dillon, 4.03, 42.6; R. L. Palmer, 4.24, 33.5; Geo. Hight, 3.39, 35.9; Chas. Harrington, 4.1, 47.5; C. V. Harris, 4.0, 41.8; M. A. McClain, 4.19, 33.0.

Highest pounds fat of association. M. A. McClain & Co., one cow, 97.6. Earl Graham, highest herd average pounds fat, 61.0 pounds; J. G. Gains, highest herd test for month, 5.62.

CALIFORNIA CATTLEMEN HAVE SOUTHERN OFFICE

The Southern California branch of the California Cattlemen's Association is now occupying offices with the state department of agriculture in the Pacific Finance Building, Los Angeles. This branch takes in the counties of Inyo, Santa Barbara, Ventura, Los Angeles, Orange, San Bernardino, Riverside, Imperial and San Diego. Officers and directors are: Hubbard Russell, president; N. R. Vail, vice president; O. B. Fuller, Lloyd Summers and James Sloan, directors; John E. Robert, zone manager.

The annual convention of the American National Livestock Association will be held at Colorado Springs, Colorado, commencing the week of January 9, at which time very many important subjects will come up for discussion, affecting the industry all over the United States. A large delegation will go to the convention from Southern California.

Mr. Robert and the directors are working out a plan whereby the various interests in the cattle business will be brought together under a comprehensive cooperative working agreement. This plan will be known as a meat council, and will be composed of cattlemen, packers, retailers, and the public will be represented by the chamber of commerce.

PURE BRED BREEDERS MEET TODAY

A meeting and luncheon of the Southern California Pure Bred Livestock Association is being held today, January 14, at the Clark Hotel, Los Angeles. It is a general meeting of breeders, and Secretary Van Pelt writes that matters of great importance to the breeders of pure bred livestock in Southern California are to be considered.

Livestock News Notes

Miss Ormsby Alcartra Prilly, a first calf senior two year old daughter of the Bridgford four times grand champion bull, King Segis Alcartra Prilly, calving at two years seven months, has just made 28.35 pounds butter from 520 pounds milk in seven days, giving her the California state record in class by a comfortable margin. Her full sister, Ormsby Mechthilde Prilly, also milking as a first calf two year old, has now been on long time test for five months and for that period has to her credit 496 pounds butter and 11,736 pounds milk, and is still milking 70 pounds per day. It is a foregone conclusion that before another year has passed, during which a number of daughters of King Segis Alcartra Prilly will have completed 305 day and 365 day records, that this famous show sire will have established himself as one of the greatest sires of yearly record heifers yet developed in California.

Miss Aaggie Ormsby Segis, the great senior two year old heifer that has just broken the world's milk record in class in the 305 day division in Fred Hartsook's herd at Lankershim, making a production of 22,072.6 pounds milk and 811.3 pounds butter in the 305 days, carries blood lines that have long held a prominent place in the breed's production lists. She is sired by King Pontiac Ormsby Segis, who is by King Pontiac Netherland Segis, a son of King of the Pontiacs and out of a daughter of King Segis Pontiac. His dam is Cristeria Overton Mechthilde 4th, the noted 31.70 pound four year old daughter of Sir Skylark Ormsby Hengerveld. The dam of the new record holder is Moorland Josephine Colantha, a 22 pound daughter of Colantha Sir Pontiac Aaggie, son of Colantha Johanna Lad.

Earl Graham, Compton, has completed a number of noteworthy long time records in his choice herd of registered Holsteins, bringing into greater prominence at least two sires that have figured largely in the recent breed development in California. Notable among these records are those of the first two daughters of King Pontiac Netherland Segis 3d to complete long time test. The first of these, Cora Jarie Pontiac, as a senior three year old made 976.55 pounds butter from 18,993.8 pounds milk in 365 days. The other, Miss Segis Pontiac Walker, calving at two years two months, finished her 365 day record with 795.78 pounds butter from 16,776.7 pounds milk. The latter heifer is out of Miss Walker Gelsche Korndyke, daughter of Prince Gelsche Walker Korndyke and the noted foundation cow, Locust Terrace Gold Drop. Miss Walker Gelsche Korndyke herself just recently completed a 305 day record in Mr. Graham's herd of 750 pounds butter from 17,663.3 pounds milk. The six year old cow, Gamma Sarcastic of Millbrae, finished a 365 day record of 967.5 pounds butter from 21,702.8 pounds milk. It will be remembered that Mr. Graham purchased Miss Segis Pontiac Walker in the Rosamaines Rancho dispersal sale in October, 1920, and purchased her dam from Bridgford Holstein Company in the Sacramento sale in December, 1920. Both are splendid individuals and both are due to calve in January to King Korndyke Pontiac 20th, the \$12,000 son of Miss Valley Mead De Kol Walker.

The J. S. Gibson Company herd of Holsteins at Williams has contributed the twenty-second highest yearly butter record to the breed's production lists in the recently completed record of Aaggie Korndyke of Nevada, that made 1,297.3 pounds butter from 30,669.5 pounds milk in one year, also adding another to the select list of 30,000 pound cows. She began her test at eight years 29 days, again demonstrating the oft overlooked fact that many eight and nine year old cows are just in their prime as far as production goes.

Burr Farm, Los Angeles, has added a number of excellent records in official testing of its high class registered Holsteins. Buena Alta Aaggie Ormsby, after completing a 365 day record of 873.2 pounds butter from 25,200 pounds milk as a three year old, calved as a senior four year old and has made

33.76 pounds butter from 652.5 pounds milk in seven days. Lady Veeman Happy Thought, a three year old daughter of Sir Veeman Korndyke Pontiac, has made 592.96 pounds butter from 13,252 pounds milk in 305 days. Carnation Segis Mechthilde, a five year old, made 20.89 pounds butter in seven days, while Bess Aaggie Creole, another five year old, made 23 pounds butter from 531.3 pounds milk in seven days.

Gracia Pontiac Burke, that made the splendid record of 33.17 pounds butter in seven days as a senior four year old in the Burr Farm herd at Los Angeles recently, is going along strong on the beginning of her yearly work. Her dam is now on yearly test in the herd owned by H. J. Long, Fallon, Nevada, and in 227 days has to her credit 735.03 pounds butter and 17,377 pounds milk.

At the annual meeting of the American Shetland Pony Club held last month at Chicago W. S. Guilford of the Butte City Ranch was named a director. Mr. Guilford is now director of two national breed associations, having been elected to the board of the American Shropshire Association a year ago.

The annual meeting of the American Berkshire Congress which was to be held at Riverside the third week in February has been called off owing to the inability of the Eastern directors to attend at that time. It is now proposed to hold the annual meeting of the Western Berkshire Congress, which was planned in conjunction with the Riverside meeting, at the university farm, Davis, during Stockmen's Week. A sale will feature the meeting.

Sir Ormsby Skylark Rauwerd, the bull at the head of the Sierra Vista Holstein herd, was recently killed following an accident he sustained in which a leg bone was fractured. Messrs. Kyne and Cash purchased this bull in the Rosamaines Rancho dispersal sale in October, 1920, for \$3,500. He was sired by Sir Ormsby Skylark and was out of the 34 pound cow, Beauty Rauwerd Hengerveld 2d.

Professor Gordon H. True of the animal husbandry division of the University of California has announced that several men of national prominence will participate in the program now being arranged for Stockmen's Week, February 20-25. Among the speakers will be Frank S. Hastings, manager of the famous S. M. S. Ranch of Texas and one of the best known livestock authorities and writers in America; Herbert W. Mumford, head of the Illinois State Agricultural Association and a leading member of the farm bureau committee of fifteen, and W. A. Cochel of the American Shorthorn Breeders' Association. Other speakers will include B. H. Rawl, formerly head of the dairy division of the United States department of agriculture.

Howard W. Vaughn of Dixon has been appointed by the California Shorthorn Breeders' Association to manage the forthcoming sale to be held at Davis, February 22. Vaughn states that he expects to be able to offer around 75 bulls and 25 females. Entries should be made with Mr. Vaughn.

Helma of Ashwood, a Jersey cow owned by McArthur & Stauff, Rick-erall, Oregon, has just completed a yearly record of 903 pounds of butter fat from 18,532 pounds of milk.

The California Poland China Breeders' Association is planning to hold a sale of bred sows and gilts at the university farm during Stockmen's Week. It is probable that the sale will occur on Thursday.

The next meeting of the members of the Poland China breed promotion committee is set for Tuesday, January 24, at Peoria, Illinois. Plans in full detail of the work for 1922 will be made.

SHORT COURSES IN DAIRY MANUFACTURING

The college of agriculture of the University of California is offering a new form of instruction this year to experienced butter makers, cheese makers and milk plant operators, for ten days,

beginning February 6. The instruction will include three lectures each day by members of the dairy industry division, three hours practice work in the commercial plant under the direction of an instructor, and two hours devoted to the discussion of commercial manufacturers' problems. Outside speakers, men connected with commercial manufacturing work, will be secured to lead the discussions.

These courses are planned to meet the needs of men now employed in dairy manufacturing and milk plant operation and to meet with men engaged in the same line of work for their mutual benefit.

Detailed information may be secured by writing to the dairy industry division, University Farm, Davis, California. Applications should be mailed in advance to the dean's office at the University Farm.

PROTEIN IS NEEDED

"If our best dairy records are made by cows on 'narrow' rations, why isn't it practical for the average dairyman to imitate such feeding?" Ivan McKellip, dairy specialist of the Ohio state university, who raises this ques-

tion in his new dairy feeding bulletin, believes that most farmers feed to "wide" a ration. He suggests more careful computations as to nutritive ratio.

Nutritive ratio, he explains, is the ratio of the protein to the carbohydrates and fat in any ration. Fat produces in the animal body about two and one-fourth times as much heat as carbohydrates; therefore, in computing the ratio, the fat is multiplied by two and one-quarter before it is added to the carbohydrates, and the sum divided by the protein.

"For example," writes Professor McKellip, "100 pounds of cornmeal contains 6.9 pounds of protein, 69 pounds of carbohydrates and 3.5 pounds of fat.

"Multiplying the fat by 2 1/4, we get 7.87; adding the 69 pounds of carbohydrates, we get 76.9 pounds of what we call 'carbohydrate equivalents.' Divided by the protein, 6.9, we get 11.1, which means that the nutritive ratio of cornmeal is one to eleven.

"Such rations are far too wide. They should be as narrow as 1.5. Most of our record cows are fed still narrower rations. We need more protein in dairy feeding."

Sir Prince Aaggie Mead

CONSIDER THE TREMENDOUS PRODUCTION AND DEMONSTRATED ABILITY TO TRANSMIT PRODUCTION ON BOTH SIDES OF HIS PEDIGREE.

His sire, King Aaggie Mead, is a son of the 1,000 lb. foundation cow Aaggie Acme of Riverside, who produced the 1,331 lb. world's strictly official record cow, Aaggie Acme of Riverside, who in turn produced California's only 1,000 lb. junior 2 year old, Miss Aaggie Acme Burke.

His dam, Miss Valley Mead De Kol Walker, with two records above 1,000 lbs. butter in one year, and now making a yearly record that promises to exceed her previous best record of 1,113 lbs., is a daughter of the 1,011 lb. 4 year old De Kol of Valley Mead 2d, who in turn is out of the foundation cow, De Kol of Valley Mead.

HE IS BEING GIVEN HEAVY SERVICE IN BOTH OUR HERDS. KEEP ONE OF HIS SONS IN MIND FOR YOUR HERD SIRE.

OWNED JOINTLY BY Fred Hartsook and A.W. Morris & Sons Corporation LANKERSHIM, CALIF. WOODLAND, CALIF.

Herd Bulls
Harris Standard 2d
Beau Blanchard 76

Nevada
Hereford
Ranch

J. H. Cazier & Sons
Wells, Nevada

A government accredited herd. No reactor in 16 years. A herd whose record in the show and sale ring is only surpassed by the esteem accorded its productions by cattlemen. We can furnish bulls or females to fill any need—and at sound prices. Visit our herd or write for information.

DIAMOND G HEREFORDS

I now offer 10 extra good open registered heifers, at real bargain price, sired by a son of an International Champion. Start your herd with these.

H. H. Gable Esparto, Cal.

Mission Herefords

One of the good herds of the State. Headed by The Peer, a son of Beau Blanchard. Young stock for sale from time to time. Visitors welcome and correspondence invited. JOHN A. BUNTING Mission San Jose Calif.

HOLSTEIN Fred Hartsook CATTLE

We have assembled an excellent foundation herd of females and will be glad to have breeders call. Fred Hartsook, Lankershim, California.

Bee Diseases

By Henry Perkins

ALL amateur beekeepers should supply themselves with the United States department of agriculture bulletins on bee diseases whether they have any reason to suspect the presence of diseases in their colonies or not. Disease is a snag you will run up against sooner or later if you follow beekeeping. When you do you will stand or fall on the knowledge with which you are equipped to meet it; luck will not get you by.

In addition to the department literature I must add that all bee books deal exhaustively with bee diseases, accompanying text with lifelike illustrations. Better than all is the county bee inspector. Twenty-one counties of California have regular bee inspectors, many of whom have numerous local deputies to aid them in covering their territory. Bee inspectors in California are paid out of the public treasury and serve without charge to the owner. A phone call or letter to the clerk of your county board of supervisors will give you your county inspector's name and address.

European foul brood, also known as black brood, and American foul brood are the two prevailing ailments which are of enough importance to be rated as diseases. Both attack the brood during the incubation period; neither affects the adult bees. The larva dies and decomposes in the cell both before and after it reaches the sealed state, when affected with American foul brood. The larva seldom reaches the sealed state in the case of European foul brood. Both diseases give the brood combs a mottled, greasy, diseased appearance. The diseased matter from American foul brood gives off

a foul, fishy odor. It settles to the bottom wall of the cell in a brown, glue like mass which will string out in a rubbery fashion from the end of a toothpick. In its last stages it becomes a dark brown scale closely adhering to the lower side of the cell.

The treatment for American foul brood is to remove all the combs from the hive and melt or destroy them. A few empty frames are given for the bees to work on if honey is coming in. These in turn are destroyed after the lapse of three or four days. The bees are then put in a clean hive, given full sheets of foundation, and if necessary fed with sugar syrup. The idea in a general way is to free the colony from the infection by first removing the infected matter, giving them time to work their bodies free from the remaining germs, then giving them a new, clean start. It is necessary to remove all combs, for the disease spreads by means of infected honey and combs and is transmitted largely by healthy colonies robbing the stores of diseased ones or by carelessness on the part of the beekeeper.

The symptoms of European foul brood are many and complicated, often closely resembling those of American foul brood, yet the two diseases are distinct. I will not attempt to describe them here, but will refer the reader to the sources of information already given. In either case great care should be taken to prevent the further spread of the disease by careless handling, especially when nectar is scarce and bees inclined to rob. Both diseases can be successfully treated, so don't throw up your hands when you discover infected colonies in your yard.

Little Known Clovers

INQUIRIES received by the United States department of agriculture show that an effort is being made to interest American seedsmen in Strawberry clover and Subterranean clover and to induce them to offer seed to their trade. The following information on these crops is presented so that buyers may have some guide as to the value of these plants and the way they should be treated:

Strawberry clover (*Trifolium fragiferum*), so called because the ripe fruiting head is about the same size and shape as a strawberry, is a perennial plant of the same habit of growth as White Dutch clover. The stems are rather heavier and the leaflets smaller and more pointed.

So far as is known this plant is used as a regular farm crop only in New Zealand and in Australia and more especially in the Province of Victoria, into which country it is said to have been accidentally introduced from Ireland. In Victoria it grows with great luxuriance, being quite resistant to drouth and still more so to excessive wet. It is said to thrive on the salty lands near the ocean, and in New Zealand it is said to do well along tidal rivers where the salt is abundant enough to prevent the growth of White Dutch clover.

When well established it makes a splendid pasture plant with all the food value of other clovers. The seed is rather difficult to hull since each seed is inclosed in a tough, bladder like envelope.

The department has had this plant growing for several years at the Arlington experimental farm near Washington. It does well, apparently a little better than White Dutch, but not as well as Ladino White clover. It is quite readily run out by the summer weeds, and young plants set out in a wet, marshy place among marsh grass were crowded out by the grass. At Arlington the Strawberry clover is growing on poor red clay and seems not seriously hurt by summer drouth nor has it ever winter killed. Its chief drawback there has been the fact that it is gradually crowded out by summer weeds. A correspondent in Beaumont, Texas, reports that several years ago some one in that place had a fine patch grown from seed received from Australia, but it was gradually

crowded out by native grasses.

Subterranean clover is an annual, but where it does well it so easily perpetuates itself by seed that it need be sown but once to have a permanent stand. It is a native of Europe, but never attracted any attention till it was found to be doing very well in Southeast Australia. Conditions there seem to suit this plant exactly. The seedlings start growing in the fall, and the plants rapidly make a dense mat of interwoven stems that creep over the ground and may be a foot high. On the approach of the Australian summer in December the plants mature and die. The dead stems and leaves are said to make good grazing during the summer.

The crop is highly praised by both farmers and experimenters, but the latter especially call attention to the fact that its period of usefulness is confined to the spring. The plant does not withstand hot, dry weather, and in at least one series of experiments it was noted that when the rains ceased the Subterranean clover, even when irrigated, showed the effect of the dry weather more than did other clovers.

From its behavior in Australia it is clear that Subterranean clover is a plant for a cool, moist climate, such as the winter climate in parts of California and the Gulf states. The weather bureau has furnished data regarding the temperatures at Melbourne, Australia. This city is in the district where both the Subterranean and the Strawberry clovers do well. The average mean temperatures for May to October are 54, 50, 49, 51, 54 and 58 degrees Fahrenheit and the lowest temperatures on record for those months were 30, 28, 27, 28, 31 and 32 degrees Fahrenheit. It should be noted that this crop thrives best at a cool temperature with but little frost.

Whether it would withstand the sharp freezes that often occur in the Southern states is problematical; but it is quite certain that Subterranean clover will not thrive in the South during the summer. Whether it will succeed as a summer crop anywhere in the North is uncertain, especially since the northern summers are so subject to severe drouths.

A crop that may be most excellent for one section may be a failure in another. The conditions under which

Subterranean clover is known to do well as are such as are found in only certain parts of this country. It may have a greater range of adaptability than is known to be the case at present; it may survive the freezes that occur in the South. If it does it will fill a place similar to Burr clover or other winter annuals that self seed. Or it may succeed in some extreme northern state where the summers are cool, provided the rainfall is sufficient.

The department has distributed trial packets, and it is hoped that more information will be available in another year.

HEADWORK PAYS ON FARM

An investigation of the incomes of 554 farmers in one county of Missouri by the college of agriculture showed that the educated farmer's income was 71.4 per cent larger than that of the untrained farmer.

The Kansas state agricultural college has made a survey of the incomes of 635 farmers in seven counties and found that the trained farmer has a greater income by nearly \$1,000 a year than those farmers with a common school education.

The United States department of agriculture reports a survey of three representative areas in Indiana, Illinois and Iowa. It is shown that tenant farmers with a college education received an average labor income of \$453 more a year than the man with a high school education and \$979 more a

more sand accumulated at the front no drifting took place behind this line and permanent trees were planted and maintained. In after years they were fed by street sweepings. The first line, or battle front, was of a large shrub closely related to the eucalypts, *Leptospermum lavaegatum*. Back of this was planted the Monterey pine, *Pinus radiata*; the cluster pine of South Europe, *Pinus Pineaster*, also known as *P. maritima*; *Albizia lophanta*, sometimes known as acacia; *Acacia latifolia*, and several species of coastal eucalypts.

WHAT IS RUBBER?

The first references to "India rubber" are found in the writings of Spanish travelers in Mexico about 1521. These travelers observed that the natives of Mexico had a national game of ball which they had developed to a high degree of skill. The travelers were greatly impressed with the remarkable resilient qualities of this ball, and they had never seen anything of the sort before.

"It was found that these wonderful bouncing balls were made from the dried juice of a certain tree, but the Spaniards failed to realize the commercial possibilities for this new product, and did not seem to make any attempt to put their discovery to any useful purpose.

About a century later, Portuguese missionaries in the Amazon regions discovered that the natives were using

Now Is the Time to Get Busy

These man power implements save time and help grow home vegetables.

year than the man with only a common school education.

Cornell University reports that men having more than a high school education received \$225 more a year than farmers with a high school education and \$529 a year more than farmers with a common school education. They also report that five per cent of the farmers with a district school education had labor incomes of more than \$1,000; that 20 per cent of the farmers with a high school education had labor incomes of more than \$1,000; that 30 per cent of the farmers with more than high school education had labor incomes of more than \$1,000. A high school education is worth as much to a farmer as \$6,000 worth of five per cent bonds. A college education is worth nearly twice as much.

The agricultural experiment station of Nebraska reports on a survey of 409 farmers in Nebraska in 1914. Those farmers who attended high school increased their labor incomes 32.1 per cent over the farmer with a common school education, and those farmers who attended college increased their labor income 51.8 per cent over the farmer with a common school education.

STAYING OF SHIFTING SANDS

Field crops and gardens, either with or without trees, may be maintained close to shifting sand dunes of the beach. Protection will of course be more easily afforded if windbreak trees are also used. But sea bent grass, *Ammophila arenaria*, also known as *calamagrostis*, will effectively check drifting sands and is the best agency for the purpose known.

After the most favored parts of Golden Gate Park in San Francisco were planted, from 1874 to 1883, in the latter year 400 acres of the worst sand was planted to this grass. The effect was almost miraculous. Even though

rubber in making such articles as shoes, clothing and water bottles. In 1731 the French Academy of Science sent explorers there to investigate the sources of this, to them, new substance. These scientists reported that it was a gum obtained from a tree and they named it Hevea.

It was Priestley, the discoverer of oxygen gas, who, observing the wonderful erasing qualities of the substance, named it "India rubber," but it was McIntosh, also an Englishman, who, in 1820, put the material to general commercial use by manufacturing rubberized raincoats.

The best kind of rubber, commercially known as "Para," is produced from Hevea trees. This tree grows to a giant height and girth, flourishing only in tropical regions. The largest plantations are in Malay States, the Straits Settlements, Sumatra, Java and Ceylon, and the greatest volume comes from Straits Settlements with Singapore as the port of shipment.

The process of collecting the latex or rubber is similar in some respects to collecting maple sugar. When the trees have matured a native picks out those to be tapped, cuts a notch and a channel, places a cup below to collect the flow and later in the day gathers his cups, carrying them to a central point where the day's "crop" is accumulated.

In general, in beautifying the farm, the first thing to do is to clean up, to place the wood pile in an inconspicuous place, to get rid of broken down, worn out farm machinery and vehicles, and to gather up loose boards and stones.

Next time you are in town see your paint dealer and get enough good paint to cover all the tools. Get your brushes also so you won't have an alibi when the times comes to do the job.

The cheapest water

CHEAP water is that which costs the least per gallon. Only the finest machined pumps can produce the cheapest water.

This is the reason for the wide-spread adoption of Byron Jackson deepwell turbine pumps. Through their daily performance extending over a period of years these pumps have demonstrated their ability to deliver the most water for the least cost, both as to power and maintenance.

Our engineering department is at your disposal—no obligation on your part.

BEES

For Sale: 80 Colonies of Bees in two story hives with full equipment. Best location in Imperial Valley. For full particulars write J. E. Beck, 1244 A Street, San Diego, California.

SEED MARKETING HINTS

The general rule of selling when the buyer is anxious to buy holds as true in seed transactions as in others, declares the bureau of markets and crop estimates, United States department of agriculture, in Farmers' Bulletin 1232, "Seed Marketing Hints for the Farmer," recently issued. Ordinarily seedsmen are eager to buy seed as soon after thrashing as possible, especially if the carryover of that particular seed from previous years is less than normal. There frequently, too, is a good early demand for certain kinds that are sown in the fall as well as in the spring.

Most large seedsmen buy the bulk of their grass and clover seed before February 1 and make purchases after that to fill open orders or to replenish low stocks. Frequently higher prices may be received after February 1, but the grower runs risk in not being able to dispose of his seed to seedsmen as late as that.

Careful attention given to thrashing, cleaning, sacking, sampling, testing, tagging, and storing of seeds, as detailed in the bulletin, generally will enable the farmer to sell his seed more readily and at a higher price than if little or no attention is paid to the proper preparation of seeds for market.

By keeping in touch with the published seed market information for the entire country and not focusing all his attention on local conditions, which may be just the opposite from those prevailing elsewhere, the farmer can determine pretty well for himself when it is advisable to sell his seed.

The farmer who has produced a surplus of seed may sell it to his neighbors, other farmers through such means as advertising and correspondence, local shippers, traveling seed buyers, distant seedsmen by mail, and by advance growing contract. In reply to questionnaires sent out by the bureau of markets and crop estimates, 2,400 growers scattered throughout the United States submitted data indicating that the farmer sells more of his seed to neighbors, although a considerable quantity goes also to the local shipper. Distant seedsmen, by means of their traveling buyers and correspondence, buy large quantities of seed direct from farmers.

Some farmers obtain good results from advertising in nearby county newspapers and in agricultural periodicals which circulate in sections of the country that consume relatively large quantities of the kind of seed offered for sale.

Various federal and state publications and, within recent months, county newspapers and agricultural periodicals, publish current information relative to the supply, demand, movement and prices of the important kinds of field seeds, when the principal movement of each kind from the farm is taking place. The farmer who makes use of this information has a better understanding of the worth of his seed and can cope with the dealer on more even terms than in the past when the dealer was almost alone in his knowledge of what was going on in the seed market.

Further suggestions concerning the marketing of seed are contained in the new bulletin, copies of which may be had free upon application to the department at Washington, D. C.

Farm bureau meetings in Tehama County will be held at El Camino, January 16; Bend, 20; Richfield, 23; Stanford, 25; Liberal, 26; Flournoy, 27; Bowman, 28. Directors' meeting at Red Bluff, 21.

INCOME FROM NATIONAL FORESTS

Livestock consisting of more than 9,500,000 cattle, sheep, horses, swine and goats grazed on the ranges of the national forests during the past fiscal year, and of the great store of timber in those reservations more than 1,170,000,000 board feet were sold. Receipts paid in or still due from these two items swell the income producing business of the national forests during the year to \$4,468,940, says the forest service, United States department of agriculture.

Animals grazing on forest ranges are classified as follows: Cattle, 2,050,715, an increase over the previous year of 16,916; sheep, 7,412,412, an increase of 141,276; horses, 78,871, a decrease of 4,144; goats, 45,190, a decrease of 10,495; swine, 3,177, a decrease of 889.

Because of the financial stringency in the livestock business during the past year the payment of grazing fees, usually made 30 days before the opening of the grazing season, was deferred by congress until December 1, 1921, affecting to some extent the revenues of the forest service from that source, but the total grazing receipts, assuming that all obligations are paid, will show a falling off of less than one-half of one per cent.

The general business depression naturally affected the lumber industry, yet the cut of national forest timber increased three and one-half per cent and was larger than in any previous year. Both the cut and sales of timber for future operations show strikingly the stability of the national forest timber business. Actual sales during the year totaled 1,170,186,000 board feet valued at \$3,211,218 as compared with sales of 1,326,922,000 feet valued at \$3,047,745 during the preceding year. The actual cut of timber during the last fiscal year totaled 833,264,000 board feet, valued at \$1,943,390. This compares with a cut of 806,131,000 board feet, valued at \$1,770,399 during the preceding year. The total number of sales of timber, large and small, was placed at 12,570 as compared with 13,272 during the preceding year. Of these totals 12,236 and 12,762, respectively, in 1920 and 1921, represent sales of \$100 or less.

Sales of timber during the last fiscal year included about 40,000,000 board feet for railroad ties and about 20,000,000 board feet for saw logs in the Washakie forest, Wyoming; about 600,000,000 board feet in the Sierra forest in California for boxes and lumber; and about 84,000,000 board feet, chiefly western yellow pine, in the Crater national forest in Oregon. In all sales the future productiveness of the ground is assured by the retention of young, thrifty trees or of seed trees, and by precautions against fire, including the disposal of the inflammable slash.

THE BITER BIT

The following amusing incident is told by a person who actually saw the occurrence:

A tom cat was walking quietly across an open piece of ground near a house when, without warning, down swooped a species of large South African eagle, commonly known as a "Lammervanger." Picking Mr. Tom up in his talons, the eagle began ascending skyward, little knowing he had caught a Tartar. The cat evidently objected to this new method of traveling, and forthwith showed its displeasure by furiously attacking its captor. Managing to wriggle around, it caught the eagle by the neck and started chewing, and was not long in paralyzing its opponent, who began circling downward and soon crashed to earth a lifeless heap. The cat quickly extricated itself and made for home, where it soon recovered from the deep wounds in its side.

HANDICAPPED

"Augustus, all you have to do is just to talk to father as man to man."

"I'm afraid I can't do that, Geraldine."

"Why not?"

"When your father looks at me there's something in his eye that seems to say he regards me as a fish, and a poor specimen of fish at that."—Birmingham Age-Herald.

Causes of Infertility

By Jean A. Koethen

EVERY year, with the beginning of the hatching season, there rises a more or less prolonged and vociferous chorus of complaints of infertility of hatching eggs. Some of these complaints are voiced by commercial poultrymen who are hatching their own eggs; some by purchasers of fancy eggs from reputable fanciers; some by backlot poultrymen who have purchased eggs "as is" from anybody who happened to have them. The man who purchases eggs from a fancier has some redress if fertility is low, for any responsible fancier will replace infertile eggs if they are tested out and returned promptly; the backlotter who buys "as is" must be satisfied with what he gets; the commercial poultryman has the remedy in his own hands.

The problem of fertility is a serious one, and it would be difficult to estimate how many thousands of dollars are lost or wasted every year from this one cause. Not only must the cost of the eggs be considered, but the time lost in incubation of eggs that will never hatch, and consequent delay in starting the pullets that are to produce fall eggs. In spite of all this loss and a pretty well disseminated understanding of the principles of fertility, the average poultry keeper who does his own hatching is disposed to take chances and trust to luck that a hatch will come out all right even though he knows little or nothing of the conditions under which the eggs were produced. There is nothing new to be said on the subject, but a resume of what is already well known may be timely.

Vigor First

Fertility unquestionably depends to a large extent on the vigor of the breeding stock, and a vigorous male is more than half the pen. Now, vigor is something more than health. Vigor might perhaps be defined as that inherent quality in the bird which is indicated by a general squareness or blockiness of build, erect carriage (in the male), a strong voice, an alert eye, a red comb, a good appetite, and (in the male) a pugnacious disposition. I have put these marks of vigor in the wrong order, for, as far as the male is concerned, the one indisputable mark of a good breeder is the fighting disposition. Show me a rooster that flies at the hand that has always fed him if that hand touches one of his harem, and I will put him at the head of the class regardless of build or voice. The male that lounges by indifferently when one of his hens is caught is not fit to head a breeding pen.

Vigor in the hens is shown by practically the same marks as in the male. They should be at least two years old because they are not thoroughly mature before this age, should be rather heavy for their breed and, above all, should be birds that have never been sick, not even for a day. No hen that has had roup should ever be used as a breeder no matter how completely she has recovered. She may lay fertile eggs but her progeny is quite likely to be marked with a roup tendency.

Environment

A study of the causes of infertility in eggs is doubly difficult because no one cause can be taken by itself. While lack of vigor is a fundamental cause, this cause is so interwoven with errors in feeding and housing that it can hardly be considered alone. A naturally vigorous male bird, kept in a filthy pen, forced to roost in a house overrun by mites, exposed to damp, chilly winds or fed an unbalanced ration is not in a position to maintain the vigor with which heredity endowed him. A hen kept in crowded and unventilated quarters, forced to wade in mud or sit on the roost when she should be scratching in dry litter cannot be at her best. It is most essential that breeding stock be kept in roomy, comfortable houses, sheltered from wind and rain and given more range than the ordinary laying stock requires. If the breeding hens after their pullet year is over can be allowed to range in a shady orchard till they are through molting they will be in much better shape for producing fertile eggs.

Forcing Impairs Vigor

The fact that fertility always suffers when hens are forced for egg production is too well known to require comment. Especially notable is the loss of fertility when lights are used during the winter months in the laying house. The hens simply cannot stand the strain of rising according to summer schedule all winter. They produce more eggs for the time being but are quite likely to go into a spring molt just when they should be laying fertile eggs. For this reason no commercial poultryman uses lights on his breeding stock. They must have their long hours of rest no matter how hard the common layers work.

The bred-to-lay hen is a creature of complex nervous organization. If she is forced to lay too many eggs she cannot make them all fertile.

Study the Hen

Experiments by several investigators have shown that vigor alone does not qualify a hen for laying fertile eggs. Some hens apparently as vigorous as others rarely or never lay a fertile egg. For this reason it is urged that the breeder try out his hens, hatching the eggs of each separately in order to determine which generally lay fertile eggs and which infertile. Such a testing out would involve considerable labor at the start, but the satisfaction of finding which hens can be counted on for producing fertile eggs would be worth the trouble. Many a breeder has no doubt had the experience I had one year when, being anxious to keep tab on the offspring of a favorite hen, I set a clutch of her eggs only to find every one infertile. Favoritism on the part of the male may be responsible for the infertility of certain hens, but it can hardly be responsible in all these cases.

Seasons and Shows

Fertility seems to depend to some extent on the season at which the eggs are produced. Eggs laid in November and December when the stock is hardly through molting are never as strongly fertile as those laid in March and April. Summer eggs are also usually less fertile presumably because the hens have not fully recovered from the strain of the winter's laying.

The fancier labors under peculiar difficulties because he must send his birds to the fall and winter shows if he is to maintain his standing as a fancier, and yet when they go they are more or less exhausted by the excitement and change, and fertility suffers. For this reason nobody expects the same fertility in blue ribbon stock that he would expect in a common barnyard flock, yet the problem is a problem just the same. Possibly the holding of shows in October instead of January may be its solution.

What About Feeding?

The relation of feeding to fertility is not clearly understood but there is undoubtedly a very close connection. Oats are considered particularly good for breeders because they build muscle, and fresh meat, cooked or raw, is valuable occasionally. Green feed is important. Wheat seems to be a better grain for breeders than milo or barley. During the war when we were forced to feed largely on barley I heard this limited ration blamed for the prevalent infertility in large flocks, with how much reason I do not know. In fact there is so much more to be known on this point that we are all working in the dark together. We know that fertility is low in stock that does not receive a balanced ration and also in stock that receives a forcing ration very rich in protein. We also know that it is sometimes very high in flocks that range for their food and receive little care otherwise, but this knowledge is not definite enough to be valuable.

The state department of agriculture is notifying truck companies that the law prohibiting intercounty shipments of nursery stock without notifying horticultural inspectors will be rigidly enforced.

THE POMONA

Duplex Plunger Deep Well Pumps

are solving the Pumping problems for many users during the period of low water levels. They will lift the water to the surface, and, if desired, deliver it to high elevations above ground and at lower power cost than any other system of Pumping water.

Poultry Queries

Conducted by Jean A. Koethen

Ration for Breeding Turkeys

What is your opinion of the following ration for confined turkey hens during the breeding season in the Coachella Valley? Morning and night we feed grain mixture consisting of 50 per cent oats or wheat, 25 per cent barley, 25 per cent milo maize, allowing two ounces to each bird per day; at noon a wheat bran mash moistened with clabbered milk; every day all the alfalfa they can eat.—Subscriber, Indio.

Your ration seems a little too fattening for breeding turkeys, especially in that climate. It would be better to make the bulk of the grain mixture wheat and oats, with just a little barley for variety. Oats in any form are excellent for breeders. You would do well to add some bulk rolled oats to the mash. Most turkey breeders feed their hens a regular laying mash, the same that is given to chickens. Keep it before them in hoppers and let them have the clabbered milk in pans. Two ounces a day is not a very large allowance of grain for a laying turkey, but you can tell by the results whether or not it is sufficient. If your birds feel thin when you handle them give more grain and close the mash hoppers for part of the day.

Market Ducks

What are the best ducks to raise for market?—Subscriber, Stauffer.

The Pekin is the only duck that is raised commercially for market. It reaches the green duck size (about six pounds) in ten weeks of age and is quite profitable.

Slatted Incubator Tray

Has it ever been definitely proven that an open bottom incubator tray is better than a closed one? If I use a closed bottom tray in my incubator it will completely shut off ventilation from below but air would circulate above the tray. Would this be sufficient?—Subscriber, Mountain View.

In visiting one of the biggest hatcheries in this part of the state a few weeks ago I noticed the eggs were all on slatted open bottom trays. The incubator was the same make as yours, an I feel sure the owner of the hatchery would not have used that type of tray if he had not believed it to be the best. When an egg lies for 12 hours on a closed bottom tray the side of the egg that is down receives no ventilation during that time. On the slatted tray every portion of the shell is exposed to an air current at all times.

Poultry Book

Where can I obtain a good poultry book?—Subscriber, Stauffer.

"Poultry for Profit," published by the Cultivator, is the most recent and complete poultry book for Californians. Send us a dollar and we will mail you the book, postpaid.

Late Molters

We have some 21 months old White Leghorn hens that have not started their fall molt yet and are still laying. Please advise if this is natural or is caused by improper feeding.—Subscriber, Watts.

Band those hens and hatch all your chicks from them the coming season if you can. They are the crack layers of the flock and there is not a thing the matter. The long distance layer that can't take time to molt is the bird every poultryman is trying to breed. If you have many of them you are lucky.

Blackhead

What disease causes a mature turkey tom to droop and sit around with no desire to eat? There is some diarrhea and the bird dies in about four weeks. Liver is enlarged with yellow spots.—Subscriber, Redding.

This is a good description of the disease known as blackhead, which carries off so many little turkeys every season, but sometimes attacks adult birds as well. It is generally ascribed to errors in feeding (overfeeding, feeding too much corn or too little green feed) which cause indigestion and encourage the development of the amoeba or blackhead germ which is believed to be present in the intestines of every turkey that is hatched.

ba or blackhead germ which is believed to be present in the intestines of every turkey that is hatched.

Laying Ration

Will you kindly tell me how to work out the nutritive ratio of my laying ration?—Subscriber, Ontario.

The nutritive ratio of a ration is not easy for the layman to work out at any time and doubly difficult since we are no longer certain of the quality and composition of wheat bran, which is the base of all mash feeds. Better buy your mash already prepared by experts or if you prefer to mix your own follow a formula which has been worked out by experts. The following which is in use at some of the California laying contests is very good: 240 pounds bran, 180 pounds ground oats, 180 pounds middlings, 80 pounds soybean meal, 60 pounds high grade beef scraps, 60 pounds fish meal, 30 pounds charcoal, 4 pounds salt. With this is used a scratch mixture consisting of equal parts by weight of wheat, cracked corn, milo maize and whole barley. Another mash recommended by the poultry division of the state college of California consists of 50 pounds each of wheat bran, shorts and ground barley or ground oats; 10 pounds each of any two of the following vegetable meals; soy bean, linseed, coconut, cottonseed; 30 pounds meat scrap or fish scrap, five pounds charcoal, one pound salt. The scratch mixture used with this mash contains 100 pounds whole or rolled barley, 50 pounds Egyptian corn or milo maize, 50 pounds cracked Indian corn.

Crooked Breast

What causes crooked breast on turkeys? Is a tom with a slightly crooked breast fit for breeding?—Subscriber, Montague.

Crooked breast is believed to result from roosting in a cramped position, perhaps in an overcrowded coop, while the bones are soft, but it is also congenital to some extent. A tom with a crooked breast might not always pass on this deformity, but he would be pretty sure to do it sometimes. It is safer not to use him for breeding. If young birds are fed a ration containing plenty of oats in their various forms and have a little bone meal in the mash they are less likely to develop crooked breasts.

Sick Turkey

A turkey hen was taken sick yesterday with indigestion and bowel trouble—droppings greenish yellow and very thin, hot water running from the mouth. I gave an enema and injected a small quantity of oculus without effect; she died this morning. This turkey has been on "tailings," the stuff left after threshing milo maize, and it has been wet for two weeks. Could this have caused the condition of the hen? What shall I do if other turkeys get sick the same way?—Subscriber, Orland.

If the turkey ate those damp, moldy "tailings" they undoubtedly upset her digestion. I doubt whether a bird that was fed an abundance of good, sweet grain would eat such stuff, but it might. Milo is not the best feed for turkeys under any circumstances. It is too fattening for breeders and apt to ferment in the crop if used excessively. If others should develop the same trouble, give a tablespoon of castor oil at once, but if you take milo maize out of their ration entirely, substituting wheat, oats or barley, and a laying mash, with all the greens they can consume, and shell before them constantly I hardly think you will have more cases. You do not say what their ration has been and I am therefore not able to advise very intelligently.

Buff Leghorns

Why are there no Buff Leghorns advertised for sale in your columns? Is there anything wrong with them? I have always understood they were the equal of White Leghorns for laying and am in the market for this breed if I can find some to suit.—Subscriber, Corning.

Fashions in chickens, like fashions in clothes, are not easy to explain. There are some breeders of Buff Leghorns in the state, and if any of them see this inquiry you will very likely hear from them. One reason why these birds are not largely bred is

(Continued on Page 55.)

Are your Hens Layers or Loafers?

Cheap Feed and High Priced Eggs

—make the industrious laying hen Queen of the Barnyard these days.

Don't let your hens become fat and lazy. Don't let the egg organs lie dormant all winter long.

You can speed up egg production.

You can make your hens lay now by feeding

Dr. Hess Poultry PAN-A-CE-A Universally Endorsed—Universally Used

—by the big ten-thousand-hen plants—by the average farmer with his 200 hens—by the back-yarder with his only a dozen hens to consume the table scraps. Pan-a-ce-a tones up the dormant egg organs, so that the proper amount of a hen's food goes to egg-making—and not all to fat, flesh and laziness when it's action and eggs you want.

A Pan-a-ce-a hen is always a hungry hen, an industrious hen—she gets off the roost winter mornings ready to scratch for her breakfast. You can depend upon it that the healthy, hungry, scratching, singing hen is the laying hen—the paying hen.

Always buy Pan-a-ce-a according to the size of your flock. Tell your dealer how many hens you have. He has a package to suit. Good results guaranteed.

30c, 60c and \$1.25 packages. 25 lb. pail, \$3.50; 100 lb. drum, \$12.00. Except in Canada.

Let Certainty Replace Gamble

EXPERIENCED poultry men all over the world depend upon Buckeye "Colony" Brooders for success. These brooders literally make three chicks grow where one grew before, cut the expense to half and reduce labor to a fourth.

Success is Certain

Hundreds of thousands use Buckeye "Colony" Brooders because they have learned their reliability, their economy and their convenience. Experience has proven beyond question that Buckeye "Colony" Brooders raise every raisable chick. With such equipment the gamble goes out of chick raising and you have the assurance of success.

Made in three sizes; burn coal, gas or oil. Sold on a money back guarantee by 15,000 dealers.

Proof For the Asking

Ample proof of these statements is contained in our new booklet, "The Revolution in Chicken Raising." You need the help of this booklet in your efforts. Sent free. Write for it today.

Pears: Winter Bartlett, 8@9; Winter Nelis, 5@7; Comice, 8@9.

CITRUS FRUITS

Grapefruit: Market steady. Californians, northern: Packed, box, 3.00; small, 2.50; market pack, 2.00@2.50; Imperial Valley, 4.25@5.00; Arizonas: Seedless, 3.75@4.75, according to size and quality.

Lemons: Demand and movement slow, market steady. Locals: Loose boxes mostly 1.25@1.50; poorer, 1.00; lugs, 50.

Oranges: Demand moderate, market weak. Navels, special brands, 150s-176s, mostly 5.00@5.50; 200s-216s, 4.50@4.75; market pack, 2.50@3.50, according to size and quality; culs, field boxes, best, 1.50@2.00; poorer, 75@1.00.

Tangerines: Demand and movement light, mostly 5@6 lb.

HONEY

Bees are reported to have gone into winter quarters in better shape than in 1920. Heavy rains the last of the month are expected to greatly increase the nectar flow of sage and other mountain plants. Supplies light, but uncertain, as some beekeepers are still holding their crop. The demand has been only fair but the small quantity available is holding the market steady. More honey disposed of locally this year than ever before. Large shippers quote to outside buyers, in carlots and less, f. o. b. shipping points, per lb.: White orange blossom, nominally 11 1/2@12 1/2, mostly 12@12 1/2; white sage, 10 1/2@12; light amber sage, mostly 8 1/2; light amber alfalfa, 6 1/2@7; amber alfalfa, few sales, 6. Very little demand is reported for Hawaiian honey, which is nominally quoted in carload lots, f. o. b. San Francisco, per lb.: White, 6 1/2@7; light amber, 4 1/2@5; dark amber, 4 1/2@5; dark amber, 4@4 1/2; honeydew honey, 3 1/2@4.

Beeswax is in light demand, with dealers offering crude wax at 22@24 per lb.

HAY

Alfalfa Growers of California report: Receipts past week smaller than preceding week. This brought urgent demand for spot lots from users and dealers whose supplies had become exhausted. The market for shipments to arrive also firm.

There were 450 tons of grain and alfalfa hay received on the Los Angeles tracks the week ending January 7, with 80 tons held over.

Prevailing prices last week, delivered in the vicinity of Los Angeles:

No. 1 dairy alfalfa.....25.00

Standard.....20.00

VEGETABLES

Sales to Retailers: Below are listed averages of actual prices obtained between 7:30 and 9 o'clock this morning by wholesalers from their sales to retailers, hotels, restaurants, cafeterias, etc. Terms: Cash on walk. Slight fluctuations may be noted during the day's trading, while higher prices are sometimes obtained where credit is given or goods are delivered.

Artichokes: Per case, 15.00@18.00; fancy, higher; Nos. 1 and 2, 1.00@1.50 per doz.; Nos. 3 and 4, 50@80 per doz.

Bunched vegetables: Carrots, 50 doz.; turnips, 40@50 doz.; beets, 40@50 doz.; parsley, 30.

Cabbage: 2.00@2.25 per crate, 1 1/2 per lb., 75@1.00 per doz.

Carrots: 90@1.00 per sack.

Cauliflower: 1.25@1.50 per doz.

Celery: Fancy, mostly 4.00 crate; poorer, 2.50@3.50, or 15 bunch.

Cucumbers: Per outside sm. box, 1.75@2.25; hothouse, fancy, 1.75@2.00 doz.; English, 1.75@2.00 per doz.

Eggplant: Scarce. Southern, 15@17 1/2 per lb.

Endive: 40@50 per lb.

Garlic: 4@6 per lb. for medium grades; poorer quality, less.

Lettuce: Sm. crate, local, 1.00@1.50; L. A., 2.00@2.25; Imperial Valley, 2.50 top.

Mushrooms: Sm. box, 50@75; larger, 75@1.00.

Olives: 5@9 per lb.

Onions: Cold storage, browns, firm, 5.25@5.50; White Globes, 7.25@7.50; green onions, 2.25 box, top.

Peas: 15@20 lb.

Beans: 10@15 lb.

Peppers: Bells, best, 20@25 lb.; chilis, 15@17 1/2 lb.

Potatoes: Firmer feeling. Rivers, fancy, 2.15@2.25; Oregon Burbanks, 2.25@2.40; Idaho Netteed Gems, 2.50@2.75.

Pumpkins: Per sack, 75@1.00 per 90 lb. sack.

Rhubarb: 2.75@3.00 per apple box; poorer, 2.50.

Squash: Summer Brawley, 3.00@3.50, small crate; cream, 60@1.00 per lug; Hubbard, 90@1.00 per 90 lb. sack.

Spinach: 7@10 per lb.

Sprouts: 6-8 per lb.

Sweet potatoes: Per cwt., 3.90@4.00.

Tomatoes: Repacked, Southern, best, 2.50@3.00 per crate; hothouse, 25@35 lb.

FRESH FRUITS

Prices furnished by state department of agriculture, division of markets:

Sales to Retailers: Below are listed averages of actual prices obtained between 7:30 and 9 o'clock this morning by wholesalers from their sales to retailers, hotels, restaurants, cafeterias, etc. Terms: Cash on walk. Slight fluctuations may be noted during the day's trading, while higher prices are sometimes obtained where credit is given or goods are delivered.

Apples: California Newtown Pippins, 4 tier, 1.85@2.00; 3 1/2 tier, 2.00@2.20; 4 1/2 tier, 1.65; B grade, 1.00@1.50. Langford Seedlings, 4 1/2 tier, 1.10@1.25; 4 tier, 1.40@1.60.

Northwestern: Newtown Pippins, extra fancy, 3 1/2 and 4 tier, 2.40@2.65; fancy, 2.15@2.40; choice, 1.60@2.00; Spitzenburg, extra fancy, 2.50@2.75; fancy, 2.25@2.50; Rome Beauty, fancy, 3.00@3.25; choice, 2.50@2.75; Bananas, extra fancy, 3.25@3.50; fancy, 2.75@3.00; Delicious, fancy, 3.50; Jonathan, extra fancy, 1.75@2.50; fancy, 1.75@2.00; Lady, per box, 2.50@3.00.

Avocados: California, large, 8.00@9.00 per doz.; medium, 4.00@6.00; small, 2.50@4.00.

Bananas: Eastern, 7@7 1/2 per lb.; red, 8 per lb.

Cranberries: Slow, 4.50@5.50 box; 1/2 bbl. Cape Cod, 17.50@20.00 per bbl.

Pears: Winter Nellis, 2.50@3.00 per box; Beurre, Clairgeau, 2.00@3.50; De Anjou, 2.00@2.50; poor storage, 1.00@1.75.

Persimmons: 1.50@2.25 per 20 lb. box.

Pineapples: 5.25@6.25 per doz.

Pomegranates: 1.75@2.25 per sm. box.

CITRUS FRUITS

Sales to Retailers: Below are listed averages of actual prices obtained between 7:30 and 9 o'clock this morning by wholesalers from their sales to retailers, hotels, restaurants, cafeterias, etc. Terms: Cash on walk. Citrus Markets

Los Angeles, January 11, 1922.
A rather weak tone exists in the orange market. California, Florida and Porto Rico have all been shipping freely and in some sections a slight glut has appeared. California Navel's are selling the highest of any offerings. Daily shipments are now averaging a little less than 50 cars a day from California.
All lemon offerings are more quickly picked up and some auction sales are reported above \$6.00. Fruit picking delayed by the storm is now being resumed.

Shipments
Shipments of citrus fruits to date since November 1, 1921. Southern California: Oranges, 2,109 cars; lemons, 1,003; total, 3,112. To same date last season: Oranges, 1,904; lemons, 854; total, 2,758. From Central California to date this season: Oranges, 4,013; lemons, 45; total, 4,058. To same date last season: Oranges, 3,808; lemons, 40; total, 3,848. From Northern California to date this season: Oranges, 361; lemons, 4; total, 365. To same date last season: Oranges, 293; lemons, 3; total, 296.

POULTRY QUERIES

(Continued from Page 53.)

that as yet they have been tried out only by fanciers. Possibly they are as good layers as S. C. White Leghorns but they have not been tested out on the commercial egg farms, and until they have been commercial producers will be slow to take them up. No other breed has so far been found that will lay as many eggs under intensive conditions or produce as much in proportion to feed consumed as the Single Comb White Leghorn.

STORRS EGG LAYING CONTEST

Storrs, Connecticut.—Report for week ending December 26:
In the eighth week of the laying contest at Storrs the American breeds occupy first place. A pen owned by Harry G. Culver, Westhampton Beach, Long Island, and a pen owned by Frank P. Matteson, from Davisville, Rhode Island, tied for first place with a production of 43 eggs each.
The four leading pens in each of the principal breeds are as follows:
Plymouth Rocks
S. Bradford Allyn (White), 231 eggs; always based on facts, it is said. How-

Seven Hills Farm (Barred), 213; James F. Macdonald (White), 187; Merritt M. Clark (Barred), 180.
White Wyandottes
Frank P. Matteson, 324; Clemens J. Diemand, 254; Woodbridge Orchards, 254; Benjamin F. Decker, 236.

Rhode Island Reds
The Orchards, 291; F. S. Chapin, 266; Applecrest Farm, 262; Pinecrest Orchards, 250.

White Leghorns
Goshen Poultry Club, 219; Holly-wood Farm, 204; Meadowedge Farm, 205; L. E. Ingoldsby, 197.

GREAT POULTRY SHOW AT ST. LOUIS

Ten poultry fanciers' and breeders' conventions were held at the Coliseum in connection with a great poultry show. Meetings of associations interested in the breeding of pigeons, canaries, rabbits and dogs were held at the same time. The show closed January 2.

Organizations exhibiting and taking part in conventions: American Polish Fowl Club, Mid-Western Bantam Association, American Barred Plymouth Rock Club, Boston Terrier Specialty Club, Pigeon Fancier Association, American Poultry Association, Rhode Island White Club of America, National Fanciers' and Breeders' Association, Missouri State Poultry Association and the American Canary Breeders' Association.

DETERMINING MARKET VALUE OF HAY

What to do with low grade hay has long been a vexing problem to the hay trade. Losses running into the thousands of dollars annually have been suffered by producers because of the difficulty encountered in disposing of hay that is improperly prepared for market or is of a mixture that causes it to be regarded as of a low grade.

In Bulletin 977, "Marketing Hay at Country Points," recently issued by the United States department of agriculture, the failure to remedy this situation is ascribed to two chief reasons: The producer and the dealers do not yet agree as to what constitutes quality in hay, and many producers lack vital market information regarding the preparation of hay for terminal and consuming markets.

Quality of hay is at present indicated largely by its color, which is used to gauge the stage of maturity at which it is cut. The hay that grades highest, and consequently brings the most money, is usually that having the best natural green color. Hay dealers can often tell from the color whether hay was cut early, medium, or late, and in their opinion the best hay is the early cut and the poorest that which was cut late.

The average hay grower, in some sections at least, does not agree with the terminal market theory of quality as indicated by color. Many producers prefer medium or late cut hay, especially for horses, because it is easier to cure and is not so "washy" as early cut hay.

In some markets size and weight of bales is an important factor, since there is sometimes a difference of several dollars a ton in the same grade of hay in small or large bales. The reasons for the demand for certain sizes and weights are numerous and are not

ever, as in many other kinds of trading, it pays the seller to aim to meet the desires of the buyer.

The production of undesirable mixtures for the market will cause a loss to the producer as long as the market does not want such mixtures. Certain of these are discriminated against regardless of their true nutritive or feeding value. The producer may know positively that certain mixtures are palatable and contain more total digestive nutrients than the kinds now in greatest demand, yet he is powerless to make feeders realize their value. The introduction and general use of a new kind or mixture of hay is a very slow undertaking, as in the case of clover and alfalfa.

About the only way to avoid trouble with undesirable mixtures, says the bulletin, is for the producer to cease growing them and to produce only the kind in demand in the markets to which his hay is usually shipped.

BEAD SEEDS

The brilliant red flintlike seeds of several plants of the pea and bean family are much used for beads. The one most common is Abrus precatorius, the "Crab's-eye Vine." The seeds come from Hawaii in great numbers though plants are grown in California. Seeds closely similar (and perhaps the ones sent from Hawaii) are those of Rhyncosia phaseoloides, a climbing bean native to the American tropics, having three large bean-like leaves, while abrus has pinnate leaves with a dozen or more pairs of leaflets. The seeds are scarlet, with a black spot on each. Used by Buddhists for rosaries.

Adenantha pavonia, the red scandalwood tree of tropical Asia, has red lens shaped seeds known to curiosity seeking travelers as "Circassian seeds." Tree occasionally is grown in California. Ormosia monosperma, the necklace tree of the tropics, sometimes known as a sophora bears a bright scarlet seed with a large angular black patch. But we do not have to go outside our own country to find a "bean tree" with fine scarlet seeds. Sophora secundiflora, native to Texas and New Mexico, is a small tree with handsome violet-blue flowers of delightful fragrance. This tree is hardy throughout California and is recommended in Bailey's cyclopedia of horticulture for "planting south." Seeds planted by the writer failed to grow. Being very hard they should, perhaps, have been soaked in water for a day or two previous to planting. —E. B.

FEDERAL ROAD BUILDING

"The signing by the president of the federal highway act appropriating \$15,000,000 for forest roads and trails marks an important step toward the development of the great resources of our national forests," states Col. W. B. Greeley, chief of the forest service. "The bill provides \$5,000,000 for immediate expenditure and makes an additional \$10,000,000 available on July 1, 1922. This money will be used in extending the present inadequate road and trail system of the national for-

ests, the development of which is so vital to the effective protection and utilization of their valuable natural resources."

The act appropriates \$9,500,000 for forest roads of primary importance to the states, counties or communities within, adjoining, or adjacent to the national forests. Of this amount \$2,500,000 is made immediately available for apportionment based on the area and value of the land owned by the government within the national forests. This distribution by states has been made by the secretary of agriculture as follows: Apportionment for the fiscal year ending June 30, 1922, of the appropriation of \$2,500,000 available immediately for national forest roads of primary importance to the states, counties and communities within and adjacent to the national forests. Of this Alabama receives \$1290, Alaska \$258,273, Arizona \$154,140, Arkansas \$18,636, California \$395,763, Colorado \$180,539, Florida \$6648, Georgia \$3541, Idaho \$278,944, Maine \$731 Michigan \$943, Minnesota \$15,777, Montana \$234,094, Nebraska \$2924, Nevada \$55,352, New Hampshire \$9343, New Mexico \$119,639, North Carolina \$7370, Oklahoma \$1495, Oregon \$310,749, Porto Rico \$385, South Carolina \$416, South Dakota \$20,511, Tennessee \$5760, Utah \$98,529, Virginia \$6941, Washington \$189,870, West Virginia \$1593, Wyoming \$119,799. Total, \$2,500,000.

A provisional apportionment of the \$7,000,000 additional for roads of primary importance to public travel will be made by the secretary about January 1. The appropriation for the construction or maintenance of roads and trails of primary importance for the development and protection of the national forests is \$5,500,000, of which \$2,500,000 is immediately available. The act prescribes no mathematical apportionment of this amount, but states that it shall be according to the relative needs of the various national forests, taking into consideration the existing transportation facilities, value of timber, or other resources served, relative fire danger, and comparative difficulty of road and trail construction. The apportionment of funds allotted under this section of the bill will be made by the secretary in the near future.

One new feature of the bill is that the cooperation of territories, states and civil subdivisions thereof is not made a requisite, as in previous acts, in the expenditure of appropriations for national forest roads. The law, however, permits the secretary of agriculture to receive cooperation, and forest service officials believe that undoubtedly considerable amounts will be offered, thereby augmenting forest road construction.

On the Sacramento River Near Butte City

Capacity Counts!

BECAUSE, through our tremendous milling capacity, we can control the source of most of the ingredients used in our feeds. For example: the bran, shorts, middlings and flour that go into SURELAY are by-products of our own mills. Then there's corn. We use 10% or more in this feed—and here are our mills in the *center* of the largest corn-growing district in the State.

Animal protein offers another example: the amount of *meat* we use daily puts us in position to secure meats of uniform, high quality throughout the year. In one case, we use the *entire* output of a single manufacturer. Again, there are vegetable proteins. Direct purchases in tremendous quantities of soya bean meal, coconut meal and linseed meal offer another price-advantage.

So there you are! You can't dodge this fact: large batches of feed can be manufactured cheaper than smaller ones. Capacity counts! We have the facilities, the equipment, the experience. Our costs per ton of feed *are* lower. No two ways about it!

Then, for extra good measure, there are the daily laboratory tests—a feature no individual poultryman could possibly afford. Before being used, each ingredient destined to go into SURELAY is analyzed in the laboratory for quality and feed value. All grains are recleaned before being ground or cracked. Never will you find mill waste, dust, smut or sweepings in Sperry Feeds. During the actual process of mixing, samples are taken regularly and tested for uniformity. It is test, test, test all the way for SURELAY—and every other Sperry Feed.

And all to what purpose? To make sure that SURELAY will live up to its reputation as the most uniform, most dependable egg mash on the market. To make sure that "what's on the tag is in the bag"—always!

Always specify SURELAY-in-the-yellow-striped-sack from your dealer; and send for the new edition of our handbook, "Makes Hens Happy." It will show you how Sperry capacity counts in bringing feed-costs down. Mail the coupon now!

OUR ADVERTISERS RELIABLE
We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

If among the more than 40,000 Cultivator's weekly circulation any fail to find any article they desire to purchase advertised in the Cultivator's columns, a special request is extended to you to let your wants be known to the California Cultivator and we will place you in touch with proper parties.

EDITORIALETES

We who live in the valleys of this west coast are given the great privilege of watching a mighty empire in the making. This may be true of the pioneers who have cleared the forests and plowed the plains and developed irrigation systems all the way across the continent, but it does not seem as if these other pioneers have witnessed accomplishments of such magnitude as have we of the Pacific Coast. A few years ago we looked at the Isthmus of Panama and wondered if wealth and energy existed sufficient to complete the work which had lain dormant so many years. Under the leadership of Roosevelt the Panama was at length dug at a cost of hundreds of millions. Later came Elephant Butte, Roosevelt and other dams. As great as these efforts were the people of the Southwest are today contemplating one involving vastly greater expenditure. A faint idea of the magnitude of this work is given in the photograph on the cover of this issue. When it is realized that the almost perpendicular walls of the canyon are nearly a third of a mile high, one begins to grasp the immensity of the work to be undertaken. The people of the United State thrive on difficulties which present opportunities such as Boulder Canyon.

The photographs presented to our readers on the cover and on the opposite page are both used by courtesy of the bureau of power and light, department of public service of the city of Los Angeles. The city of Los Angeles is, by the way, taking the position that the wonderful power possibilities of the Colorado should be secured to the people at cost of service, and to that end is urging other communities and cooperative institutions to unite and work with Secretary Fall of the department of the interior.

The development of this canyon has been hoped for by the people of seven states, and at the same time it has been feared that its resources might fall into the possession of selfish interests. At the Riverside meeting when Secretary Fall made his first definite statement in effect that the dam to hold back the floods of the Colorado and supply waters for irrigation and for the creation of hydroelectric power would be constructed by the federal government a thrill ran through the assembly and there was a great shout of approval. From that moment there has been assurance that the resources of the Colorado shall remain in the hands of the people.

But California's power and water development possibilities are not all included in the basin of the Colorado. Note some of the accomplishments in San Diego County. Note also the saving of flood damage by the Devil's Gate dam of the Arroyo Seco and the flood protection measures of the San Dimas Canyon, both in the Sierra Madre Mountains. There are almost daily meetings of those who would save the waters and stop the damage of their wastes from San Gabriel, San Antonio, Santa Ana and other canyons.

Farther north the waters of the Kern, the Kings, the San Joaquin, now wasting, are also causing discussion. The great Pine Flat district organization is perfecting itself and big type announcements in the dailies say: "District will be formed under Harris act; work starts at once." Civic and other organizations are now appealed to to supply funds for preliminary work costs. We are not certain whether it is ten million or a score of million that this great improvement will

cost, but sure it is that California energy is behind it and the work will be done.

San Francisco is reaching across the bay and planning to parallel the great rivers with an aqueduct which will carry the water of the Hetch Hetchy to San Francisco and give an abundance of pure water to that city and to the smaller communities down the peninsula.

The Turlock Irrigation district is now carrying advertisements announcing the sale of over a million dollars worth of bonds "for the building of Don Pedro dam and power development in connection therewith." And we note that these six per cent irrigation district bonds are selling as high as \$110.27, certainly one great compliment and proof of the worth in the eyes of the purchasing public of irrigation district bonds.

Still farther north the Sierra Nevada is filled with water conservation and power development possibilities. Then on the floor of the valley there are many districts like that of Sutter basin where through drainage, levees and irrigation thousands, almost millions, of acres are being brought up to fuller production.

From near the base of Shasta and Lassen waters have been captured and

illustrations to make this number well worth the filing.

The United States has installed water wheels with a capacity of 9,243,000 hydroelectric horsepower. The leading states are New York with 1,300,000 horsepower and California with 1,111,000 horsepower. In Europe France leads with 1,400,000 horsepower. America is the most advanced of any country in water power development, 40 per cent of the world's developed horsepower being in this country. The total potential water power of the world is approximately 439,000,000 horsepower, of which 62,000,000 is in North America. Africa has the greatest possibilities.

Application should be made at once for 1922 motor vehicle registration. The application must be in prior to February 1.

EDMUND DAY STURTEVANT

E. D. Sturtevant, at one time the world's largest grower and highest authority on aquatic plants and water gardens, died at his home in Hollywood, January 13. Mr. Sturtevant was formerly in business in Bordentown, New Jersey, and at that time was the largest importer of lotus and other water plants. He has resided in Los Angeles for the past 30 years where he has had water gardens stocked with some of the choicest introduced plants and others which he has bred. Bailey's Cyclopaedia refers to the work accomplished by Mr. Sturtevant and gives to him credit for making popular in this country many water plants of great beauty.

GION W. GIBSON

By the death of Gion W. Gibson of Williams, which occurred at Woodland, January 16, there has been removed from the ranks of California Holstein breeders one of the most popular and a man who has contributed much to the development of better livestock. Mr. Gibson brought to the livestock industry enthusiasm, vision and ideals of such high order as to leave a deep and lasting impress upon the affairs of his chosen breed. Mr. Gibson believed profoundly in the relation of better livestock to general agricultural practices in this state, and it was primarily because of that conviction that he incorporated the breeding of Holsteins with his extensive farming operations.

In all things Gion Gibson was progressive in spirit, and in all contacts with his fellow breeders and neighbors his conduct was such as to first inspire respect and then friendliness. Always did he exhibit a kindly feeling to those who held honest differences of opinion, but he had an open contempt for those whose motives and actions would not stand scrutiny. In short, he combined to a high degree all the qualities expected in a citizen, a gentleman and a breeder.

NO WATER TO BURN

Amongst the striking photographs in this issue, which illustrate some feature of irrigation, is one showing the water on fire. We have heard it stated that the time would come when water might be decomposed and its hydrogen and oxygen released and the world given one of its greatest powers, for no greater heat is created than by the bringing together again of oxygen and hydrogen. This accomplishment is doubtless many years in the future. Meantime we are simply using the illustration of the gas being released by the water to enforce the lesson of saving the water of the hillsides.

The burning of the brush and the forests of California mountains has been an event of more or less regularity since the discovery of fire. During the last few years we have used forest patrols and airplane patrols, and have saved possibly millions of acres from being burned over, but the campaign of education is far from ended. The Cultivator wishes it could make more forceful in some way the necessity for this protection from fire. At this writing it may seem needless, but with the dryness of next camping season the devastating fires will begin.

Make it a slogan, "Save the forests." We haven't enough water to burn.

carried across the valley and are being used to grow golden oranges and yellow lemons in the foothills of Butte and are even carried across the valley and are growing other citrus fruits in Glenn and even as far north as Shasta County. We had hoped to have from the pen of Jas. Mills, Jr., a few words as to northern Sacramento irrigation development, but the mails have mis-carried and Mr. Mills' copy is not in.

It may seem a bit untimely to talk at such length on irrigation so soon after one of the finest rains ever poured out on California's valleys, and even as we go to press predictions are for "Probable rain all over the state." But it's none too early to begin planning for next season's irrigation, and some are already conserving the waters in the soil by winter irrigation. Under proper subsoil conditions this is an excellent practice.

There are literally scores of different makes and types of pumps, and California's own factories have turned out some of the very finest. One hundred per cent efficiency is not yet attained, but the manufacturers are approaching it as rapidly as possible.

This issue does not contain all about irrigation. In fact, it only touches the margins of the great reservoirs filled with the experience of semi-arid America's irrigators. Still we believe there is sufficient of value in tables, text and

California Cultivator

Vol. LVIII, No. 3

Los Angeles, January 21, 1922

One Dollar Yearly

Stop the Floods, Save the Water, Use the Power

IF the Sweet Singer of Israel lived in California he could say with even greater truth than he did some 3,000 years ago: "I will lift up mine eyes unto the hills whence cometh my help." In California there was never such a searching of the hills for water. Active men have tramped over hillsides, and even toward the top of Mt. Whitney, and have come back and dreamed dreams until we are talking of millions, and almost billions, needed to develop and conserve the waters which the hills have been sending, sometimes in a devastating way, towards the ocean.

In many cases the dreamers have se-

For some three or four years the people of the seven Southwestern states have been studying southwestern problems, especially those pertaining to the Colorado River basin. The recent meeting held in Riverside has been characterized as one in which there was more of contention than of positive definite action, but we believe it has resulted in attracting attention to the possibilities of the Colorado in a way which will mean much earlier development.

A commission has been formed, directed by Herbert Hoover, assisted by a commissioner, usually the state engineer, from each of the seven Southwestern states. This commission is

prosperous. Nor is the increased irrigation the only advantage, for from this one dam waters would be supplied which would give a greater amount of hydroelectric power than is now secured through the use of Niagara Falls. To be exact, engineers state that these waters would be capable of generating 700,000 horsepower of electrical energy.

The photograph on this page gives a view up the valley of the Colorado from the upper end of Boulder Canyon. On the cover is a view of the canyon, giving an idea of its narrowness and the nature of the walls which are at the highest point shown in the picture more than 1500 feet above the water

Roosevelt Dam, or railroad cuts, or lofty buildings, the human toil is almost nothing; the power is mechanical, by steam or electricity. In our states of the Southwest the great new formative things are cheap water and cheap power. Any government, any state, any town or farm community, or water company, or power company must know this. Not to know it is suicide. This is the law, the irresistible economic mechanical law of our age, and the law and demand of these states of the Southwest, cheap water and cheap power.

"Whatever will help supply our human need for food and clothing and shelter within the reach of all men, women and children; whatever will reduce poverty; whatever will reduce the unbearably high cost of living; whatever will for these states of the Southwest produce cheap water and cheap power must be done for our economic salvation.

"The Colorado River project is, by water and by power, to help bring down the high cost of living and to open up a new empire that shall be the happy habitat of at least fifty million prosperous, happy human beings, in these Southwest states.

"It is a project to give to our soldier boys today an opportunity for farm lands comparable to that which awaited the soldier boys of '61 when they made a new empire of the great western prairie states. It is a project to give employment to the army of the unemployed.

"The keynote of the modern world in all great matters must be publicity. Three thousand years of secret diplomacy has wrecked this poor world. The masses of mankind have not been consulted in their own affairs. Secret intrigue has been their undoing. In at least trying to secure publicity as against secret diplomacy at Versailles, President Wilson was right. When he took the world into his confidence for public consideration of international affairs in the Disarmament Conference President Harding was right. When at the first opening of that conference he instantly laid before all mankind the inmost purposes of the Disarmament Conference of Nations Secretary Hughes was right. And so also there is a new day for publicity in our national, industrial and corporation and business affairs. The people have a right to know the people's business and to transact it.

"The vast business of developing the Colorado River for irrigation, flood control and power for the people of seven states cannot be permitted to be fixed up for the irrigator or farmer or user of electric light and power by secret agreements of men hidden in inner offices in Washington, or Phoenix, or Denver, or Salt Lake City, or even in Los Angeles or Riverside.

"Whether this vast project shall be developed by federal and public administration or by private enterprise, it must be done generously and in a spirit of service to all. Irrigation and flood control are the first pressing necessity for those down in the valley of the Colorado. But they also must have cheap power for their many necessities.

In the matter of Colorado River water rights they include those secured by international treaty, by special acts of congress, by various state appropriation laws; rights of public domain lands, rights of many large Indian reservations, rights of privately owned lands. Overlapping all these problems of water rights and irrigation will be the use of these same waters for generating vast quantities of hydroelectric power, and nature's tremendous problem also of flood control. Shall this vast work be done by government or by private enterprise? Or by both?

"Remembering the vast service to be rendered, the countless difficulties,

(Continued on Page 67.)

Site of the Greatest Inland Artificially Created Lake in the World

Looking up the Colorado River from the upper end of Boulder Canyon. When the 600 foot dam is erected the waters will be backed up the Colorado a distance of over 80 miles, and up another tributary stream almost an equal distance. See photograph of Boulder Canyon, the site of the dam, on cover of this issue.

cured action, and the valleys are blossoming and fruiting and harvesting in quantities which have sent great trainloads from the state from year's end to year's end. There is still so much waste that scarcely a week now passes but people gather and say: "How long?" Fortunately, the time is shortening as never before. Communities, counties, state governments and the federal government are becoming more and more active. The recent visit of Secretary Fall and his pledge of as early action by the department of the interior as is possible has created new enthusiasm. Besides, the recent floods doing much damage and giving visible proof of the great wealth wasting into the ocean have also given added impetus to the conservation campaign.

Only a few months ago we began discussing the Marshall plan which would call for the expenditure of some hundreds of millions of dollars. Now we are all discussing the California water and power act which will be voted upon next fall and, if passed, will mean material increase in water development possibilities, use of waters developed by the people at actual cost.

just beginning its work, but already a most definite start has been made toward one branch of development known as the Boulder Canyon water and power project.

Boulder Canyon is a very narrow granite sided gorge on the Colorado River between Arizona and Nevada, only a short distance above the California line. Above it, as if by special provision of nature, lies a valley through whose center runs the Colorado. This valley is more than 80 miles long and in addition has several branches, notably the valley of the Virgin River running to the northward through part of Nevada and into Utah.

The placing of a 600 foot dam across Boulder Canyon will make possible the irrigation of more than two million acres of land. Nearly three-quarters of a million acres of this land is now irrigated from the waters of the Colorado, but because of its ugly mood at flood time much of this three-quarters of a million of acres is jeopardized and the welfare of tens of thousands of producers of food menaced. Boulder Canyon dam would effectually protect these acres and make other millions

flowing in the stream below. The dam when constructed will be something over 600 feet in height, or less than half way up these walls. The length of the dam at the base will be nearly 200 feet, and at 600 feet above water level it will have a length of about 1,000 feet. The foundation will extend some 130 feet below water level and will be on bedrock. This dam will hold the entire flow of the Colorado River for one year and a half. The waters conserved by this dam can be used only in Arizona, California and Mexico, but, under modern methods of long distance transmission, the power will be available in several of the Southwestern states.

Touching upon the increased wealth made possible by this development, Mayor Horace Porter of Riverside, in addressing the League of the Southwest, said in part:

"The Colorado River project is three problems in one—irrigation, flood control, hydro-electric power—a trinity of problems. Three in one, one in three. "Today when we build a Panama Canal it is not done by toiling multitudes of men as drudges, it is done by mechanical power. If we build a vast

Agricultural News Notes of the Pacific Coast

Northern California

It is reported that extensive plantings of hemp will be made in San Joaquin County.

The Trinity County Fair Association plans to purchase permanent fair grounds of 35 acres at Hayfork.

The dried peach crop of the state is estimated at about 20,500 tons, over 80 per cent of which have been marketed.

There is proposal to erect a hemp mill at Chico if sufficient Butte County farmers can be interested in hemp growing.

At their December 28th meeting the directors of the Poultry Producers of Central California declared dividend of eight per cent.

The Asparagus Growers' Association met January 9 at Walnut Grove to complete organization and plans for marketing the 1922 crop.

Sale of registered Herefords at University Farm, Davis, February 21, by members of Pacific Coast Hereford Cattle Breeders' Association.

An auction of 800 fat steers was held at Hat Creek, Shasta County, January 5, under management of the farm bureau marketing committee.

The Happy Valley irrigation district in Shasta County will deepen its main canal from Hoover Creek in time to serve the coming irrigation season.

Farm bureau meetings in Shasta County will be held at Redding, January 21; Millville, 24; Palo Cedro, 25; Hat Creek, 27; Fall River, 28; Mountain, 29.

Canning peach growers met at Walnut Grove, Sacramento County, last week to discuss the newly organized California Canning Peach Growers Association.

The California Development Board is raising a fund of \$10,000 to survey lands of the Sacramento and San Joaquin Valleys suitable for colonization under state land settlement aid.

Drying of cling peaches will be taken up by the California Canning Peach Growers. The association hopes in this way to save great quantities of undersized and overripe fruit.

An accredited January hatchery list of 13 in Sonoma County has been published by the Sonoma County farm bureau. This list will be corrected each month as hatcheries comply with standardization requirements.

The California Supervisors' Association in its last meeting at San Francisco made serious study of motor truck loads and their effect on paved highways at different rates of speed. Uniform state and county law was discussed.

The California Development Board estimates total value of California grape crop to grower, \$92,608,820; wine grapes, \$28,628,350; table grapes, \$18,774,770; raisin grapes, \$45,205,200. Railroads report 28,800 carloads grapes shipped this season from state, distributed in 6,200 cities.

General Manager Barber of the Poultry Producers of Central California says: "The surplus of Pacific Coast eggs is now carried by the producers' marketing associations which are able collectively to store in the flush season and to ship to other markets at all times, thus keeping the surplus cleaned up and maintaining a reasonable market."

Central California

The Holstein Breeders' Association held its annual convention at Modesto January 11.

Ceres growers are asking the California Peach and Fig Growers to build a fig cannery in that city.

A Yosemite snow carnival is being planned by the Fresno chamber of commerce February 17-20.

The California Grape Growers' Exchange has 520 members controlling some 25,000 tons of grapes.

San Joaquin County planted 4,365 acres to vineyards the past season, 2,880 of which were Tokays.

Fresno County supervisors are considering requiring stages and buses to stop before crossing railroad tracks.

Plans for raising funds to plant trees on the highway west of Visalia are being made by the Visalia Welfare Club.

An ice cream plant is to be built at Newman, Stanislaus County, capable of handling 3,000 gallons of milk per hour.

April 29, Saturday, is probable date of this year's raisin festival. 1922's festival queen will be chosen from Kings County.

The newly elected directors of the California Grape Growers' Exchange will meet at San Francisco February 22 to select officers.

Two days of fig pruning demonstrations will be given in Stanislaus County January 24 and 25 under supervision of the farm adviser.

The Stanislaus County Fig Growers' Association met at Ceres high school to make plans for the coming season and to select a director to represent the association in the California Peach and Fig Growers.

The newly organized Canning Peach Growers in session at Fresno January 10, selected A. D. Pogetto general manager. Mr. Pogetto has been manager of the Earl Fruit Company plant at Loomis, Placer County.

The Hughson, Stanislaus County, board of trade has finished a products survey of the county. Number of ranches surveyed was 365; average ranch acreage, 40; per centage of alfalfa to total acreage, 33 1-3 per cent.

At a meeting in Fresno, January 11, of representatives of the irrigation districts interested it was determined to organize the Pine Flat project under the California water storage district, or Harris, act. Petitions are being prepared for circulation in eight districts.

The Bakersfield Commercial Association has appointed a committee "to investigate the power rate situation in agricultural districts and to appear before the state railroad commission in the hearing now in progress, with data and recommendations for findings that will be just to the farmers."

The local chamber of commerce has a plan for advertising Porterville. A metal name plate containing the word "Porterville" in blue letters on a white background is the device to be used for publicity, and hundreds of the plates will arrive shortly for the use of motorists. The plates are to be attached either below or above the state license plate, and are the same color as the 1922 license plates.

Southern California

All the orange packing houses at Rialto are working full handed.

Twenty per cent of the lemon crop moved by water the past season.

Brawley, Imperial Valley, is sending out 100 carloads of lettuce a day.

The Imperial Valley Press and the El Centro Progress are to be consolidated.

The 12th National Orange Show will be held at San Bernardino, February 17-27.

The Oxnard Citrus Association held its annual meeting at Hueneme, January 7.

San Fernando Valley is urging establishment of a junior college of agriculture.

A large acreage has been sown to grain in Apple Valley, San Bernardino County.

The Fontana Citrus Association is installing new equipment in its packing house.

R. H. Ehlers of Blythe sent over 1,000 turkeys to the holiday market in Los Angeles.

The last farm home demonstration meeting at Jurupa studied refinishing of old furniture.

The Rincon Road has been put in good condition and now shows no trace of storm damage.

Large plantings of cucumbers for pickling are planned for the Zelzah section of the San Fernando Valley.

Supervisors of Ventura County are discussing the paving of the Dennison Road between Santa Paula and Ojai.

Poultry diseases will be discussed by Dr. J. R. Beach of the state university at Van Nuys, January 25, and at San Gabriel, January 26.

Three trainloads of Navels, 150 cars, left San Bernardino for the Eastern markets, January 10. This is the record for the season so far.

The Anaheim Lemon and Orange Association shipped 1,100 carloads of citrus fruits last year. This is a gain of approximately 35 per cent over previous year's shipments.

The Los Angeles County farm bureau through its committee on water conservation is urging "investigation of every possibility of impounding runoff waters in the San Gabriel watershed."

A. P. Davis, chief of the United States reclamation service, says that the proposed flood control and conservation dam in the San Gabriel Canyon is entirely feasible and should be built.

The Tri-Counties Reforestation Committee at its 14th annual meeting at Riverside, January 12, passed resolution asking the secretary of the interior to order a study of the drainage area of the Santa Ana.

Paul Baxter of Fertilta, Riverside County, is planting a large acreage to lettuce and asparagus. These crops have not heretofore been grown in a large way in that section and Mr. Baxter hopes to compete with the early Imperial Valley crops.

Los Angeles County Mutual Fire Insurance Association at its 23rd annual meeting last week reelected P. F. Cogswell, president; Geo. F. Cromer, secretary-treasurer. Mr. Cogswell succeeded the late A. T. Currier as president some months ago.

The Coast and General

The Yakima Poultry Association (Washington) will be held the third week in January.

Thousands of gallons of canned apples are being sent to Europe via the Panama canal from Portland.

Ten poultry conventions were held at the Coliseum in St. Louis last week in connection with an enormous poultry show.

The Washington Cooperative Egg and Poultry Association will soon open a branch office in the Yakima Valley.

The annual convention of the Washington State Poultry Breeders' Association will be held in Spokane on January 26. The Spokane County breeders will hold their annual poultry show during the same week.

The Lewis-Pacific (Washington) Dairymen's Association has been granted a temporary restraining order against one of its local members who had broken his contract with the association. The order restrains him from shipping milk to any other purchaser.

At a recent meeting in Forest Grove the Oregon State Horticultural Society elected the following officers: D. W. Johnson, Corvallis, president; E. A. Reuter, Forest Grove, vice president; C. D. Minton, Forest Grove, secretary-treasurer, and Senator McNary, trustee.

The potato grade and pack conference held the last day of the potato show and conference at Spokane, Washington, recently, voted to retain United States grade No. 1 and adopt an additional grade to be made up of not less than 75 per cent No. 1 grade potatoes and 25 per cent or less of No. 2 grade.

A poll of the first 12 men attending the recent annual meeting of the Washington State Horticultural Association revealed that their plantings of cover crops have increased 67 per cent this season over last. Everyone sowed some kind of cover crop this fall, several for the first time. The favorite is vetch, though oats and rye are often sown with it.

"If nothing else was accomplished except the decision to grow three standardized varieties of potatoes in Clackamas County (Oregon) these five days have been worth all the time and effort they have cost," said County Agriculturist Holt at the closing meeting of the farm bureau at Oregon City. The three varieties adopted are American Wonder, Burbank and Garnet Chili.

A consignment of a million pounds of Pima cotton, valued at \$500,000, has left Phoenix, Arizona, for a government bonded warehouse at New Bedford, Massachusetts, where it will be more quickly available for mill use. Several hundred growers are represented in the shipment, the farmers having pooled the cotton through the Arizona Pima Cotton Growers' Association.

The dairymen of Crook County, Oregon are holding regular monthly meetings at which they may get together on the various problems which confront them and also to discuss the different methods used by each. W. B. Tucker, county agent, usually presides. The meetings are held at the different farms, and when weather conditions are unfavorable, at the agent's office at Prineville.

The Dam and the Lake (Lake Hodges), San Diego County's Greatest Conservation Work

The first view, at the left, shows the dam from the lower side. This structure is 130 feet high. The center shows the spillway where two billions of gallons of water are wasting every 24 hours. The lake being filled there is no place for it to run but to the ocean. The view at the reader's right is a portion of Lake Hodges six miles from the dam. This was near Bernardo where the water is still 30 feet deep.

Status of Irrigation in San Diego County

By Robert R. McLean

PERHAPS no county in the state presents more variations of topography or of soil and climatic conditions than San Diego County, all having an exceedingly important bearing upon drainage and irrigation.

The rainfall ranges from a normal 10 or 12 inches in a belt a few miles wide along the coast, up to 40 or 45 inches on the higher mountains, and the soil from many types of sandy loams to gravelly loams and heavy adobes. There is much variation in these soils and in the subsoils as well, and any system of irrigation must necessarily take these factors largely into account.

Irrigation of fruit trees as a general rule is not practiced in San Diego County in the higher altitudes where the rainfall exceeds 16 to 18 inches, nor in some of the lower valleys and stream beds where sufficient water may be stored in the soil in normal years to meet the needs of the plant. Irrigation is provided in every locality for commercial vegetable growing.

Because of the fact that much of the county is mountainous, the streams comparatively short and the drop to the ocean level more or less rapid, it follows that much of the rainfall in periods of heavy rains, such as have been experienced this winter, must be lost unless there is some means provided for holding back the flood waters.

In the stream beds, in the hanging valleys and in many of the interior lower valleys such as El Cajon and Escondido, much water can usually be obtained by pumping, about one-half of the present irrigated acreage of the county, as near as can be estimated, being supplied in this manner. The possibilities of irrigation from underground supplies of water, however,

are fairly limited and no great increase in irrigated acreage can be looked for from this source. This source of water is also more or less precarious as in dry years the underground reservoirs, except perhaps in the larger stream beds, may become dangerously low. The chief dependence of the county for any great advance in the matter of acreage under irrigation must therefore be placed in artificially stored supplies of water.

The need for reservoirs has only been partially met, but plans are under way looking towards the conservation of a large part of the flood waters of the county. The great Lake Hodges dam, situated between Del Mar and Escondido, is the latest large dam to be constructed for irrigation purposes. This reservoir, containing 40,000 acre feet of water, was filled to overflowing during the December storms and over the lip of the magnificent multiple arch structure, 130 feet high on the down stream side, poured a flood 385 feet wide and 2 feet deep, sending over 2,000,000,000 gallons of water to waste every 24 hours.

The completion of this dam will make possible the opening to irrigation of many thousand acres of mesa land in a belt running along the coast from Del Mar north. This mesa land is practically frostless and has been farmed mostly to hay and grain. It can now be devoted to valuable intensive crops, particularly to winter vegetables such as the Carlsbad district is famous for.

The Cuyamaca system, including the Murray dam reservoir at Lake Mesa, holds nearly 6,000,000,000 gallons and is the principal source of water for

La Mesa, Lemon Grove, Spring Valley, El Cajon and East San Diego, although El Cajon is supplied to some extent by wells. The Sweetwater system with a capacity in excess of 10,000,000,000 gallons, now full and overflowing, supplies National City, Chula Vista and Otay and in addition irrigates about 5300 acres of citrus and vegetable lands, there being practically no wells in the district covered by it. The Escondido system impounds something over 1,000,000,000 gallons and supplemented by wells supplies Escondido City and irrigates many hundred acres.

The San Diego City reservoirs, impounding about 47,000,000,000 gallons at their present capacity, supply water principally to the city itself although some small amount is also used for irrigation.

The total irrigated lands in the county approximate 25,000 acres and the prospects for increasing that acreage are immediate, due to the building of the Lake Hodges reservoir and to a general awakening on the part of the county in general as to the absolute necessity of providing for the care of surplus water.

Almost without exception citrus groves are irrigated wherever located in the county, either by privately owned water systems developed from wells 30 to 90 feet in depth or by water bought from a water company. The frequency of the irrigation and the amount of water used annually depends to some extent upon the rainfall and the type of soil, but in general an irrigation is given every 28 to 35 days during the season and from 12 to 15 acre inches are necessary to supple-

ment the rainfall. A better system of irrigation is gradually coming into practice, that of the deep furrow method, and this, combined with the intelligent use of the soil auger, is cutting down much of the waste of water that even in dry years has been the rule.

Vineyards in the lower valleys are not generally irrigated although there is no question but that they should be. In former years dependence has been placed upon the deep rooted habit of the grape, but growers are coming to find that by two or three irrigations during the season the yield may be increased from 1½ to 2 tons per acre. Not only has a failure to irrigate cut down the tonnage but the vines will suffer badly next season because of the shortage of water last summer.

This same condition will apply to most unirrigated deciduous fruits as well. No orchard should be planted on land that is not well drained, and a rainfall of 14 or 16 inches on such land, coming as it does in the space of a few months in the winter, is not sufficient to carry a tree or a vine through the long summer period, taking one year with another.

The acreage in winter and summer vegetables is being largely increased as the facilities for irrigation are being supplied. The amount of water used depends upon the soil, drainage and if summer or winter cropped, or both, but probably from 20 to 30 acre inches are necessary for more or less continuous cropping.

With reasonable methods of irrigation and the building of suitable reservoirs to take care of the flood waters in the county, there should be enough water developed and stored to place under irrigation many thousands of acres now idle or devoted to low value crops.

Irrigating Field Crops

By R. A. Condee

ASK an orchardist how much much irrigation water he applies to his grove and in nine cases out of ten the answer will be so many miners' inches per irrigation, or a certain number of acre feet for the season. Put the same question to the general farmer and in most cases he will frankly admit that he does not know or will tell you he just "pours it on" his alfalfa, corn or other field crop and lets it go at that.

As a matter of fact the majority of farmers do one of two things in irrigating their field crops. They either pour on too much water or starve their crops by applying too little water.

In irrigating we must keep in mind two important facts. First, that 95 per cent of the plant food for the growing of our crops must come from the water and air, and that while water serves the double purpose of furnishing plant food and carrying dissolved plant food from the soil to the plants, it can be applied in such quantities as to exclude the amount of air necessary for the growth of the soil bacteria without which the food supplied by the water is of no value. Second, that for every pound of dry matter manufactured in our crops we must supply from 500 to 1,000 pounds of water.

Efficient irrigation meets these re-

quirement at the least possible cost per acre irrigated.

The term, "duty of water," is used in two different senses; as the number of acres a given flow in cubic feet per second or other unit will irrigate, and as the annual depth of irrigation water applied to the land. The depth of water applied during the irrigation season to the land is reckoned in acre feet or acre inches. To convert this into the duty as defined by the number of acres one cubic foot per second or one miners' inch will irrigate, it is necessary to know the length of the irrigation season.

For example, if the duty of water is 2.5 acre feet per acre for the year and the irrigation season extends over a period of five months, say from May to September, the number of acres which can be irrigated with a definite flow of water is determined in the following manner: One cubic foot per second flowing for 24 hours is about two acre feet for 150 days, which would be equivalent to 300 acre feet. This amount of water with a duty of two and one-half acre feet per acre would serve 120 acres, the duty then being expressed as one cubic foot per second of water to 120 acres. To convert this into miners' inches per acre, since there are 50 miners' inches to

one cubic foot per second as used in California, one miners' inch will serve 2.4 acres, or 120÷50.

If an alfalfa grower wished to determine the amount of water to be pumped to irrigate 100 acres of alfalfa at intervals of 15 days to a depth of, say, three inches, he would have to solve his problem in the following manner:

One miners' inch flowing for 24 hours is equivalent to 0.476 acre inches. The irrigation interval being 15 days, one miners' inch for 15 days then is 0.476x15, or 7.14 acre inches. As we wish to apply the water to a depth of three inches, the flow in miners' inches per acre will be equal to 3÷7.14, or 0.42 miners' inches per acre. To apply this depth every 15 days with this amount available would require the continuous operation of the pump. If the pump is operated only half the time .84 miners' inch per acre, or .84 miners' inches to the 100 acre field of alfalfa, would be required. If the pump is operated one-third of the time, or ten 24 hour days each month, a pump capacity of 126 miners' inches would be required to irrigate the 100 acres.

It is not possible to give "blanket rules" to be followed in irrigating any particular field crop since the soil

conditions, locality, variation of seasons, method of water application, cost of water, and many other factors enter into the problem. Here, as in most other farm operations, horse sense must be used. The farmer must study his irrigation conditions if he hopes to produce crops that return the maximum of profit.

Alfalfa

More water per acre is required for the growing of this crop than most of the other forage or field crops. Alfalfa has been known to wilt on the heavy clay lands of Southern California when 15 per cent of moisture was present in the plants, while on sandy loam soil it will make satisfactory growth with six or seven per cent moisture content.

This is accounted for by the character of the plant, the rapidity with which it grows, the number of crops produced during a season and heavy tonnage obtained.

On most of the successful alfalfa ranches of Southern California duty of water for growing alfalfa is around 2½ acre feet for the season. This amount will vary with the condition of the land and the depth to a water table or other natural subirrigation condition present on the field to be irrigated.

VIKING Rotary Pumps

Sizes: 10 to 1050 Gals. per Min.
Belt Drive or Direct Connected with Motor

NO one disputes the high peak of pumping efficiency attained by the Rotary Principle exemplified in the Viking Pump. Its design permits of no loss of power through whirling or churning of water in the pump casing. Every revolution of the Viking Pump impeller draws in a definite quantity of water, passes it through the pump and forces it out the discharge. Its action is positive. Mechanical losses are reduced to the minimum. Maximum utilization of power is accomplished by the Viking Pump.

Power bills decrease as pump efficiency increases—a good and sufficient reason for using a Viking.

In California is produced as a second crop following barley or oats the problem of its irrigation is considered on that basis. As corn to follow barley or oats must be planted after the winter crop has been harvested, and as this comes around the first of June when our fields are at their driest, it is always necessary to irrigate before preparing the seed bed. Most growers use a disk harrow for cultivating the land following irrigation. Plowing is not the proper practice at this season of the year, as the moisture is lost before the corn can germinate.

If the corn planted is for silage use it is well to give frequent irrigations and produce excessive growth of stalks. If the object is the production of corn then the young plants should not receive a large amount of water until they are well along in growth. For this crop about three

good irrigations are sufficient, irrigating the last time about the time the tassels and silks begin to appear.

Irrigating in furrows between the corn rows is better than flooding the whole surface and allowing the water to come in contact with the corn stalks.

In the irrigation of the double crop land and of alfalfa the farmers of California are coming more and more to using the surface pipe method of applying irrigation water, and while this system has its defects it is much superior to the old border and check method.

The soil auger for determining the moisture condition of our fields is a necessary tool on the modern farm. The saturation of the surface of the soil means very little to the irrigator unless he knows to what depth the moisture has penetrated.

Irrigation in Arizona: Past, Present and Future

By M. E. Bemis

JUST a few years ago, as we commonly count time, the Indians held undisputed and undisturbed dominion over the country that is now Arizona. The Indian that the early Spanish explorers found knew but little of irrigation. It is true that some prehistoric race, possibly the ancestors of the Indians of today, possibly not, had practiced irrigation on a large

States reclamation projects and one of the most successful. Scattered areas of smaller projects and considerable land supplied by water pumped from wells comprises the balance. Yuma County, with another project of the United States reclamation service, has the second largest area of irrigated land. In Graham County on the upper Gila there has been developed a considerable area of irrigated land, and

Before Taking Water and After Taking Water: Two Arizona Scenes

The desert as it was in Arizona and as it is yet in sections where water has not been applied. The lower scene gives a glimpse at the state capitol. The palms and the trees give an idea of the luxuriance made possible when the desert lands, Arizona climate and irrigation water are combined.

scale, but save for rows of trees and faint traces of their ancient canals there is nothing left to tell us of these ancient people or of their irrigation works which antedated any others in the United States. Present day irrigation is of comparatively recent date. Just a little over a half century ago the settlers in Arizona commenced to lead the water out of the streams to irrigate the desert valleys. It is only with the beginning of the work of the United States reclamation service that irrigation may be said to have been successful.

Arizona has a total area of a little more than 72,000,000 acres. While a considerable portion of this great area is grazed by cattle and sheep, and some is classed as dry farming land, considerably less than 1,000,000 acres are now irrigated. The acreage which is susceptible of irrigation is variously estimated but may be conservatively placed at between 3,000,000 and 5,000,000 acres.

Maricopa County has nearly as much irrigated land as all the rest of the state, the total acreage being something more than 300,000 acres. Of this more than 200,000 acres is under the Roosevelt Dam or the Salt River Project, one of the first of the United

in Pinal County irrigation from wells has been developed to a larger extent than in any other part of the state. In Apache County the state has financed the rebuilding of an irrigation project that will irrigate about 15,000 acres. Small projects in Pima, Santa Cruz, Yavapai, Greenlee and Cochise make up the irrigated land of Arizona.

As proof of what irrigation has meant for Arizona it should be necessary only to state that only one state in the Union increased its population in the decade from 1910 to 1920 as much as 50 per cent and this state was Arizona, with an increase of 63 per cent. Maricopa, the county with the largest irrigated area, increased 159 per cent. Next in rank was Yuma with an increase of 92 per cent in population.

Maricopa County ranks twelfth in the value of crops produced in the list of the fifty leading counties of the United States. During the past ten years the valuation of property in this one county has grown from \$17,800,544 to \$134,265,501; the deposits in banks from \$4,894,550 to \$24,608,275 and the number of farmers from 2,662 to 6,588. There was not a foot of paved streets or roads; now the larger towns have paved streets, and 150 miles of paved

roads throughout the county with as much more to be built in the near future. Schools have been built that are the pride of citizens and the admiration of visitors. This is what irrigation has meant.

Many other projects are contemplated. In Maricopa County a dam has just been completed west of the Salt River project on the Gila River, which will irrigate some 50,000 acres.

A plan is being worked out to utilize the drainage waters from the Salt River project for irrigating several thousand acres additional. Bonds have been authorized for the extension of the Salt River project on the east, by the utilizing of flood waters and the building of a dam on the Salt River above the present diversion dam and below the Roosevelt dam. In addition engineers have completed plans for several dams on the Verde River which will irrigate about 90,000 acres in what is known as Paradise Valley north of the Salt River Valley. In all a total of 400,000 acres is under partially completed or contemplated projects in Maricopa County in addition to the more than 300,000 acres already under irrigation.

Other projects proposed are the San Carlos project on the Gila in Pinal County to irrigate possibly 200,000 acres, the Lotus Valley in Yuma County, the Williamson Valley project in Yavapai County, and last and most important of all a great area of land mostly in Yuma and Maricopa Counties, which may possibly be irrigated from the development of the Colorado.

Irrigation has made great advances within the past ten years, and with land becoming more and more valuable, and with better methods of irrigation, it may well be considered that irrigation is still in its infancy and will not be complete until every stream has been harnessed, storing all waters for use as needed, developing power for pumping from underground sources, and leaving a surplus of power for manufacturing and for transportation of the products of the farms, and for lighting farms and cities. There is wealth in the water that now runs to destructive waste, and riches untold in the soil that can only be unlocked by water.

IRRIGATING THE VEGETABLE GARDEN

By D. F. Reichard

THE garden that gives the best results, other conditions being equal, is the one that gets water in proper quantities. Or it may be put stronger: A garden properly irrigated will give better results than one with other conditions more favorable but with the water supply inadequate. The amount of water applied to a garden is not the all important thing about irrigation. The nature of the soil and the atmosphere must be considered. The way in which the ground is handled after the water is applied is quite as important as the water itself.

Light sandy soil will require more water than heavier soil because it is more porous and does not retain as large a per cent of moisture. It is surprising, however, to note how nicely sandy soil does hold moisture when it is properly cultivated. There are stretches of very sandy soil that hold moisture enough to make good crops of melons or corn without any more moisture than is supplied by the seasonal rains. We can not depend on carrying on a successful garden without a regular supply of water, however. Atmospheric conditions have much to do with the requirements of irrigation. During the hot days of summer there is great evaporation going on all the time, both from the and from the growing plants. Windy weather taxes the stored up moisture even more. It is at these times that the water supply should be well under control so that it may be applied before the plants show signs of distress. A stunted vegetable is like a stunted animal; it is never as good as though it had been pushed right along from the beginning.

When irrigating, do it thoroughly. Soaking the ground to a depth that will reach the lower roots of the garden stuff is essential.

The method of applying water to the garden is a very important consideration. The furrow method is the best. Plant stuff in rows so that it

may be furrowed out to allow the water to flow slowly between the rows. Dirt is thrown up around the plants, preventing the water from getting immediately around them. If water gets immediately around young growing plants it makes the ground bake and harden, causing injury to the plant. Furrowing out prevents this.

the surface will appear to be thoroughly soaked while the roots are in dry ground. This can only be overcome by the use of a sprinkler that has a wide spread and that can be set to run for at least an hour at a time without having the water to run off.

It has been demonstrated that to get the best results thorough cultiva-

tion of having moisture in the soil is that the plant gets its food through the water taken up by the roots. Therefore it is necessary that there be an ample supply of plant food in the soil for the water to dissolve for the plant to assimilate. Rich soils will produce a quarter more on a given amount of moisture than poor soils, and the product will be of much better quality.

Pumping Plant Which Supplies the Municipality of Alhambra

The city of Alhambra has found the Pomona Duplex Plunger Pump entirely dependable in furnishing to that city its water supply. This is one of a system of deep well pumps and is proving economical and efficient. It is manufactured by the Pomona Manufacturing Company, Pomona. One feature of this house which makes for efficiency is an arrangement of the roof which permits opening and a hoist for lifting sections of the pump in case repair is needed.

Where a sprinkler is to be applied, use one that makes a large distribution of the water so that it may be left to run in one place for a considerable time. One is apt to be misled by the sprinkling method because

tion must follow each irrigation. The cultivation, besides killing the weeds, makes a fine surface mulch which retains the moisture from air evaporation.

The reason of the great importance

WATCH YOUR VALVES

The power of a tractor engine is largely dependent upon the good fit and accurate timing of its valves. The valves are put on an internal combustion engine to permit the fuel and air mixture to enter the combustion space in the cylinder, to inclose tightly the burning gases during the power stroke, and to give the burned gases an opportunity to escape on the next stroke. A good fit is essential because the valves must hold the gases within the cylinder under pressure at times, and even a slight leakage may mean a big loss of power. If the valves are not properly timed it is equivalent to permitting a deliberate leak of gases from the cylinder, which again means loss of power.

Valves should be examined at regular periods, and if they are pitted or if they show any indication of leakage, if the seat of the valve is not perfectly bright all the way around, then grinding must be done. On most tractor engines it is difficult to get valve timing out of adjustment so long as the cam shaft retains its relative position or the cam shaft gears are not changed. If by any chance they do become misadjusted, leave their adjustment to a tractor expert, or if it is necessary to adjust them without the aid of such a man, be sure that explicit directions are gotten and followed.—Allis Chalmers Nose Bag.

COMPARE THE PRICE OF REMCO TANKS

With Prices of Metal Tanks of Same Capacity and You Will Find the Remco Redwood Tank Much Cheaper. It is also Better and More Lasting.

We will ship you, immediately on receipt of order, any standard Remco tank of the dimensions or capacities shown below at the prices here listed:

Rudiments of Citrus Fertilization

By E. L. Koethen

LIKE all other farm processes, the questions of irrigation and fertilization are inseparably interwoven. An error in one may neutralize the value of the other. To be more specific, should you apply water so freely to the orchard that it would wash the fertility away into the waste ditch the fertilization will fail to be effective. Again, after the application of soluble salts such as sulphate of potash, nitrate of soda, or sulphate of ammonia care should be taken to guard against carrying the salts clear away from the roots in the ground water. It should be remembered that in the case of the nitrate, for instance, it is claimed that all the nitrate not utilized by the trees before the third irrigation after its application is carried away in the ground water, and thus made inaccessible for the tree's use. For this reason it is the custom to apply such fertilizers in small doses at frequent intervals, and then the irrigator should be cautious not to use more water in the flow than will give a good wetting. It may be good practice at times to allow a run off, in order to carry away the accumulating

alkali, but not just at this particular time.

This touches upon what has become to us in California a very serious question, the accumulation of injurious salts in the soil. The recent rains have rendered a signal service in accomplishing this much needed office. We were formerly told not to allow the waste water to flow from the orchards in streams as we often see. But there is another side to this. A happy mean should be maintained between wasteful loss of fertility and the judicious washing of the orchard soil in order to remove an accumulation of injurious salts. In a series of dry years such as have just terminated this becomes a great menace to the orchardist.

After the application of barnyard manure in the growing season it is of course best to get it covered with soil as quickly as possible, and the best way to cover it is by a more or less deep plowing. A disking only partially covers, and for that reason is not nearly so effective. Plowing should be immediately followed by a good irrigation in order to settle the soil and prevent undue drying out. This also

puts the manure applied to immediate use as it causes decay to begin at once, and it is through the process of decay that the manure becomes available.

In the case of the application of manure by the more recent furrow system of application, the irrigating furrow should be placed along side the furrow where the manure has been covered so that it may be soaked well with water and put to work.

Some orchardists have tried the experiment of doling the nitrate of soda out into the flume while irrigating, and trusting to this as a means of applying the fertilizer. We do not know that this has been tried out in a really scientific way, and would not recommend it except as an experiment for we orchardists cannot afford to do much experimenting on our own initiative where it involves a radical change in methods, without sound advice from the experiment stations. At random we would warn that several things might be looked for in such an experiment. If the salts are distributed in the water at the beginning of the run it would likely place too much of the fertilizer in the soil at the head of the land; if after the water had been through it might not deposit it evenly as it flows down, but carry too much of it to the lower end of the orchard. In either case an even distribution would not be obtained. For these rea-

sons we would consider it much safer to irrigate first and then while the ground is still quite moist scatter the nitrate of soda, sulphate of ammonia, or sulphate of potash on the ground evenly, and then when dry enough cultivate. This insures an even distribution and gets the salts to work before the next irrigation, the moisture still being sufficient to dissolve it.

There is one more phase of the question not touched on above, that is the relations of soil moisture to fertility.

Moisture is just as essential to proper action in the soil to bring about real fertility as the chemical elements. Without moisture those subtle combinations which the chemist calls nitrification cannot take place. The layman says, "Moisture is necessary for decomposition." This means that the forms in which the plant food is found in the soil must be changed by breaking down the materials into other forms. The phosphorus may be tied up in the original rock from which the soil is made, so also with the potash. Nitrogen may be tied up in insoluble compounds until reduced by decay processes to available nitrogen. For these processes moisture is essential. Then again the soil may be kept so wet that deleterious compounds may be formed instead of available ones. The chemists say denitrification takes place. For these reasons the times for irrigation should be so timed as to obtain a maximum efficiency in the soil processes. The farmer says the soil must be kept friable and not sticky. The shorter time it remains too wet at the time of irrigation the better fertilizer conditions are maintained, providing the soil remains at all times moist and friable.

International 8-16 Power and International Equipment — the Wise Combination

These International Machines, Requiring Power at Drawbar or Belt, are Built to Work Right with Tractors:

BELT

Threshers
Baling Presses
Feed Grinders
Corn Shellers
Ensilage Cutters
Huskers and Shredders
Huskers and Silo Fillers
Cane Mills
Stone Burr Mills

DRAWBAR

Grain Binders
Harvester-Threshers
Headers
Push Binders
Mowers
Grain Drills
Corn Binders
Corn Pickers
Plows
Disk Harrows
Spring-Tooth Harrows
Peg-Tooth Harrows
Field Cultivators
Culti-Packers
Manure Spreaders
Wagons

WHY do thousands of successful farmers own International 8-16 Tractors and use International equipment with them? Here are plain reasons.

They know:

1. That the International Harvester Company, because of its 90-year experience, is in better position than any other company to design and build long-lived practical farm tractors.
2. That International Harvester tractors and machines are designed to work together as field units.
3. That the most practical and helpful service is quickly and easily and always available to them.
4. That reliable service has always a definite cash value in tractor operation.
5. That these factors are guaranteeing their investments for years of usefulness.

The International 8-16 tractor is a combination of sensible design and high-grade construction with many points of superiority. It has a 4-cylinder valve-in-head engine, with all working parts enclosed; throttle governor; removable cylinder sleeves; high tension magneto; and kerosene carburetor.

Its light weight, snug compactness, ease of control, generous reserve power, economical operation, and general fitness for diversified service has made it highly popular everywhere. Its present price includes all necessary equip-

ment—platform, fenders, governor, adjustable drawbar, belt pulley, etc. In case you require larger power, note that this same equipment is included also with the Titan 10-20 and International 15-30 Tractors.

Be guided by the judgment of thousands of International owners. For belt work now and for drawbar work in the spring, follow their advice. Use International equipment. Remember that both Titan 10-20 and International 8-16 now sell for \$900—lowest prices ever quoted on these tractors with their present equipment.

FIG PRUNING DEMONSTRATIONS IN STANISLAUS COUNTY

Two days of fig pruning demonstrations are staged in Stanislaus County by Farm Adviser Jungerman:

January 24, 10 a. m.—The Erb ranch, one mile north of Waterford, one and three year old Kadotas. 1:30 p. m.—Henry Long ranch, one mile west of Empire, one year Adriatics. 3 p. m.—J. W. Guyler, two miles east of Modesto on Waterford road, one year and full bearing Smyrnas.

January 25, 9 a. m.—Clark ranch, two miles north on Tully road, one, two and full bearing Smyrnas. 10:30 a. m.—Charles Sanders ranch, one mile north on Tully road, Smyrnas. 1:30 p. m.—J. W. Brown ranch, one mile west of Ceres, four year old Smyrnas. 3 p. m.—R. S. Hiatt ranch, across road from Brown farm, one mile west of Ceres, full bearing Smyrnas.

AVOCADO ASSOCIATION TO HAVE LOS ANGELES OFFICE

At a recent meeting of the directors of the California Avocado Association final arrangements were made for the marketing of the avocado crops for the next five years through the American Fruit Growers, Inc., one of the largest fruit and vegetable distributors in the United States, and with facilities for storage, packing and marketing in the principal cities throughout the country. The interests of the association will be looked after by Karl M. Wagner, who will have an office in the warehouse of the American Fruit Growers, 2160 East Seventh street, Los Angeles, and will be there on Mondays and Thursdays to receive fruit and to meet any of the growers who have business to discuss.

Preparations for the annual meeting in May are under way. There will be an experience meeting and several papers of interest to avocado growers, the usual avocado banquet and the annual business meeting. Wilson Pope of the department of agriculture expects to be in California at that time and will tell some of his experiences in hunting out avocados in Central and South America.—R. Agnes McNally, Retiring Secretary.

PRUNE AND APRICOT GROWERS EXPLAIN ASSOCIATION

A state wide campaign to give information about the great California cooperative marketing associations of growers has been launched by the California Prune and Apricot Growers, Inc. It will consist of a series of speaking tours by Dr. F. M. Coleman, formerly a grower, who will address chambers of commerce, commercial and other clubs. Manager Coykendall, in explaining the

INTERNATIONAL HARVESTER COMPANY

CHICAGO

OF AMERICA
INCORPORATED

U S A

92 Branches and 15,000 Dealers in the United States

educational work undertaken by the association, said: "Cooperative marketing in California has been more successful than any other place in the world and has brought millions upon millions of dollars in prosperity to the state. The public in general is in sympathy with the work being done by the great California cooperative organizations of growers, but it is woefully ignorant as to how these cooperative associations are formed and how they operate. We are constantly receiving requests from business organizations, colleges and schools and private individuals asking us to explain our organization. Such widespread interest on the part of the public deserves special attention. The present plan of education means we are going to take our story directly to the public instead of waiting for the public to come to us."

EFFECT OF DIFFERENT LININGS ON SEEPAGE FROM IRRIGATION DITCHES

To prevent the seepage obtaining in unlined canals, linings of different materials have been tried. Those used or experimented with are concrete, wood, oils, and clay puddle. From investigations made for the Irrigation Investigations and the California experiment station, and from more recent experience on the efficiency of the different types of linings, the following results can be anticipated:

A good oil lining, constructed with heavy asphalt road oil, applied on the ditch sides and bed at the rate of about three gallons per square yard, will stop 50 to 60 per cent of the seepage.

A well constructed clay puddle lining is as efficient as a good oil lining.

A thin cement mortar lining about one inch thick, made of one part cement to four of sand, will prevent 75 per cent of the seepage.

A first class concrete lining three inches thick, made of one part of cement to two of sand and four of gravel, will stop 95 per cent of the seepage.

A wooden lining, when new, is as efficient as a concrete lining, but after two or three years repairs and maintenance will become an important item, and by the end of eight or ten years it will necessitate complete renewal.

The disadvantages of the cheaper linings are the following: An oil lining stops only a part of the seepage losses, and while it will resist erosion well, it probably will not prevent the growth of weeds for more than one season unless a high velocity is used, and it will not stop the activities of burrowing animals. Oil linings have not been sufficiently tested to determine their durability. Clay puddle will not prevent the burrowing of animals and weeds grow rapidly, especially since the velocity of the water must be small in order to prevent the eroding or washing of the lining.

Advantages of Concrete Lining

A concrete lining has none of the above disadvantages, and it meets the requirements of a good lining better than any other material. The only objection is its higher first cost. But where water is valuable its expense is well justified. In Southern California the use of concrete lining dates from about 1880, when the increasing value of water made it necessary to do away with losses. Since that time practically all canals in that section have been lined with concrete, and in some cases replaced with concrete pipes. Until recently very little concrete lining has been used outside of that region, but during the last few years concrete lined canals have been constructed on many of the projects of the United States reclamation service and on numerous private projects. There are now many examples in California, Oregon, Nevada, Washington, Idaho and other states, and during the past three years some good work has been done in British Columbia.

The feasibility of using concrete linings will depend on the extent and value of water loss and on the necessity for prevention of waterlogging of the land below by seepage water. Other benefits which must be considered are the decreased cost of maintenance and operation and the greater safety. There are no weeds to contend with, no breaks to mend, and consequently the cost of patrolling is largely eliminated. It must also be remembered that a higher velocity

can be given to the water in a concrete lined canal, and a smaller and better form of canal can be used which,

especially on a side hill, will materially decrease the cost of excavation. But even when only the value of the

water loss is considered, it does not require a large loss nor a very high price for water for this annual value to represent the interest and depreciation on a capital sufficient to put in a first class concrete lining.

MILK OF HUMAN KINDNESS STILL UP TO STANDARD

In these days of rush and hurry and thoughtlessness it is good to be able to take note of an instance of good old fashioned kindness and neighborliness such as is reported from a Minnesota community.

A serious accident which befell a farmer, confining him to the hospital for two months, left all his fall work undone. Utterly discouraged, he was astonished one morning at the approach of an army of neighbors, men and women, who took possession of the farm. A parade of men with teams clattered into the corn field. Twelve men, the carpenters of the bunch, set about repairing the buildings. Before the end of the day all the corn had been husked and stored in the newly repaired cribs.

Seven tractors were turned loose in the stubble under the guidance of competent operators, and in a few hours the farmer's worry about his fall plowing was all over.

The feminine contingent cleaned the house from attic to cellar, and from the supply of food brought with them prepared the dinner for the hungry horde of workmen.

Water to Burn—and It's Burning
This is a striking photograph of a stream of water and gas being pumped on the ranch of Henry Norohna near Marysville. The pumping is accomplished by use of eight inch Viking Rotary pump. Water so heavily charged with gas makes a most difficult pumping problem. In this case the gas is so abundant that it was ignited just before the photograph was taken, and the blaze is the most striking feature in the picture. The De Laval Pacific Company are the coast distributors of the Viking.

Plant an Orchard

Look to the roots—the foundation of your tree. No other district produces a tree of such well toughened fibre, so hardy and with roots so fibrous and well branched as our foothill soil and location.

Write us for complete copies of the announcements of the "Bergtholdt Plan." This plan is a vital issue to every fruit grower—to all California. It means your success and ours in fruit growing. The responsibility for this plan is upon every individual fruit grower—boost for it.

Growing fruit is the best paying business in California.

The acid test of any business is not what it will do under favorable conditions, but what it will do under adverse conditions.

Even under this year's depreciated values, the orchardist with a block of **Prunes, Bartlett Pears, Apricots, Cherries, Raisins, Shipping Grapes, Clingstone Peaches, Drying Peaches, Fall Pears, Almonds, Shipping Peaches, Shipping Plums, Canning Plums,** and **Figs** will make more money than the grower of grain, hay, alfalfa, beans, rice or the dairyman.

Every acre of land adapted to fruit growing that you now employ in growing grain, hay and other crops, is too valuable for fruit to be employed as you are now doing.

Every year that you grow these other crops instead of planting your acreage to orchard, represents not only a dead loss in money, but more than that, one year's loss of life's opportunities.

The trees you plant now will, five or six years hence, assure your share in the profits inherent to the California fruit grower.

We offer for your planting the most complete assortment of commercial fruit varieties.

Our trees are the best that care in propagation and efficient workmanship can produce.

Our catalogue, full of accurate practical horticultural information and suggestions, and our thirty years' experience in fruit growing, and fruit marketing, are at your service for the asking.

Submit us a list of your tree wants for quotation while the varieties you desire are still available in our foothill grown stock.

California Crop Report for 1921

IN the annual crop report for 1921 to be issued by the California cooperative crop reporting service early in February, Agricultural Statistician E. E. Kaufman will say:

"The production of California crops in 1921 again failed to measure up to the record year of 1919 or even equal the production of 1920, while the steady decline in the price of farm products shows a very decided decrease in the total value as compared with either of the preceding years.

"The total value of all products of the soil in California for 1921 is \$362,690,000, which is \$126,420,000 less than the total for 1920 and \$198,384,000 less than the total of 1919.

"The acreage harvested of all field crops shows some decrease and the bearing acreage of all fruit crops a

cent higher than in 1919, while in 1921 they decreased from 25 to 30 per cent, compared with 1920.

"The 1920-21 winter rainfall was normal or better in the northern half of the state, but interfered to some extent with plantings, some land being fallowed on this account. Pastures as a rule in this section maintained an excellent condition until late fall. In the southern half of the state the rainfall was well below normal, consequently pastures were very poor. The hay crop, except where irrigated, was light and the acreage of grain curtailed.

"Killing frosts in April and the first few days of May damaged all fruits, except citrus, and were particularly severe on the grape crop. Temperatures were high the last of June and through July, but averaged near nor-

Typical Citrus Grove Pumping Plant

This installation was by Layne & Bowler and is on the C. J. Johnson ranch near Piru in Ventura County.

slight increase. The tonnage of both field and fruit crops decreased from the tonnage produced in either 1920 or 1919. The total acreage of all field crops harvested in 1921 was 5,194,149, compared with 5,689,573 in 1920, and 5,875,609 in 1919.

Expressed in the unit measure of tons, the production of all field crops in 1921 amounted to 8,132,243, as compared with 8,282,526 tons in 1920, and 8,134,749 tons in 1919. The total farm value to the grower of field crops in 1921 was \$162,202,000, as compared with \$235,558,000 in 1920, and \$298,146,000 in 1919.

The total production of all fruit crops in 1921 was approximately 2,416,950 tons, valued to the grower at \$181,488,000. In 1920 the fruit crop production was approximately 2,617,963 tons, valued at \$232,557,000; and in 1919 the production amounted to 2,635,070 tons with a record value of \$241,628,000.

"Shipments of cantaloupes in 1921 were 13,163 cars compared with 13,147 cars in 1920 and 12,010 cars in 1919. Shipments of other vegetables totalled 26,923 cars in 1921, compared with 24,563 cars in 1920 and 20,071 cars in 1919. The value to the grower of cantaloupes and vegetables shipped, canned and trucked to market was approximately \$19,000,000 in 1921; \$21,000,000 in 1920, and \$21,300,000 in 1919.

"The farm labor supply in 1921 was more than sufficient, and notwithstanding the fact that wages were greatly reduced, was more efficient than in any year since 1916. In 1920 farm wages were from 15 to 19 per

mal for the balance of the season. A late rain in May damaged the grain hay crop and injured pastures, and a heavy north wind on July 4 damaged fruit in the Sacramento valley, especially pears. Conditions at harvest were generally good, the rice and bean growers being favored with ideal harvest weather.

"The 1921 production and the value on the farm on December 1, or at time of harvest, for the various field and fruit crops are as follows:

Crop:	Production	Farm Value
Corn	4,060,000 bus.	\$3,126,000

Stop the Floods, Save the Water,
Use the Power

(Continued from Page 59.)

the conflicting interests, the aim should be the reconciliation of these conflicting interests for common action based upon the great fact that all these various interests can be properly served because the mighty Colorado under the God of Nature and by man's conserving hand can supply water enough and to spare for all the agricultural lands of the vast Valley of the Colorado. And incidentally the river as it waters these lands will generate power and to spare for farm and city for a radius of hundreds of miles both east and west of the great stream. For a dozen great reservoirs will eventually impound the waters of this American Nile, creating irrigation, flood control and power all the way.

"The reclamation policies of this United States of America shall be revived and carried on; that though interrupted by the great war the reclamation policies of him who by his mighty arm built the Panama Canal, who by that same mighty arm initiated the great reclamation policies, specially for the seven states of the Southwest, which region he knew in its needs and loved; that this mighty work shall be revived and carried on to the upbuilding of this Empire of the Southwest; that as we will not forget him, so we will not suffer to lag or to die the great policies and good works of Theodore Roosevelt.

"And we do call upon President Harding and his cabinet and upon the congress of the United States immediately to revive and carry on the great Rooseveltian reclamation policies.

WALNUT GROWERS INSTITUTE

The Walnut Growers Institute, held at the high school auditorium at Santa Ana Friday of last week, brought together more than 400 representative walnut growers. This was the fourth annual institute and was called to order by W. M. Belding, president of the Orange County farm bureau. Six counties with a membership representing 85,000 acres of walnuts answered the roll call. Cultural and scientific questions of interest to the walnut growers were discussed by Messrs. Hodgson, Barrett, Fawcett, Newman, Quayle, Kellogg and Batchelor. W. S. Rosecrans, president of the Los Angeles County farm bureau, asked and answered the question, "Is the American Farmer Awake?"

EUROPEAN AGRICULTURAL CONDITIONS

The past year was the driest European agriculture has known for a century or more, says a cable from Alfred P. Dennis in London to the Department of Commerce. Subsoil moisture is still low in Germany, France, northern Italy and England. Sowings of winter grain were retarded by dryness of soil and unseasonable cold in November. There is a marked falling off of sowings in Austria, Rumania, northern Italy and France. The shortage may possibly be offset in the latter country by spring seeding. Acreage of other countries is fully maintained or increased, with favorable growing conditions throughout December. Intensive efforts being made to increase food production, particularly in Belgium, Germany, Denmark, Poland and Czechoslovakia, indicate that Europe is fast pulling up to pre-war production. A striking revival of the Danish pork products industry means sharpened competition with similar American products in British markets. Government control of foodstuffs is impending in Rumania. There is an embargo on grain export from Hungary and Yugoslavia. Bread subsidies are to be cut down in Austria after January 8. Rising prices in countries of inflated currency follow the suspension of bread subsidies, tending in turn to restrict consumption and stimulate production. Europe is returning to pre-war production faster than to pre-war consumption. Import demands are limited by reduced consumption and sheer inability to finance requirements abroad. Requirements in Italy, Austria and Germany, and in a lesser degree in Belgium, France and Greece, will become acute with the exhaustion of home supplies in the spring. The question of finance will largely determine the source of imported supplies. The pressure of the new Argentine crop is also a determinative influence. The demand for American grain, especially in central Europe, will tend to slacken unless extraordinary credit facilities are afforded importing countries by the United States.

Standard of the World

The Byron Jackson Deepwell Turbine

The deepwell turbine is becoming a subject of increasing importance to farmers and ranchers who believe in the practice of business efficiency and economy extending over a period of time.

This promises to be a deepwell turbine year—a year that will mark a universal adoption of this principle of water development.

The Byron Jackson Iron Works, not only pioneer pump builders, but always leaders in progressive pump development, have prepared to meet this demand with a variety of types and sizes for any requirement.

For More Water Storage

By William M. Bristol

MAY it please the Court of Public Opinion, and especially those members of the court who dwell along the lower reaches of the Santa Ana River in the principality of Southern California, I am an orange grower. My local habitation and orchard is (I purposely use the singular verb for the two) on the elevated East Highlands mesa, high above all canals taking water from the Santa Ana River or from the Bear Valley system. I am a hundred feet above all possibility of flood damage from the Santa Ana or any other mountain stream. The water I use for irrigating 60 acres of orchard is pumped from a gravel filled depression in a prehistoric earthquake crack, the so-called San Andreas rift. This great crack, the longest continuous fault in the known world, can be traced all the way from the Imperial Valley in the south to Point Arena on the northern California coast. It takes its name from the fact that it was first noticed and studied in the San Andreas Valley just south of San Francisco. In 1857 a fresh slip along this ancient crack extending northwestward from Cajon Pass, in San Bernardino County, through Elizabeth Lake to and beyond Tejon Pass caused an earthquake which shook all Southern California; and it was a similar fresh slip along a more northerly section which resulted in the San Francisco disaster of 1906. The entire East Highlands mesa was uplifted at the time of the original crack, which may have occurred a hundred thousand years ago, the vertical displacement where the line crosses my own place being over 200 feet, as evidenced by the logs of various wells. The uplift being on the downhill side, it resulted in the formation of a long and narrow valley or channel along the south base of the San Bernardino mountains into which all the various

mountain streams debouched, the gravel and boulders washed down gradually filling this channel while the water flowed over the uplifted southern rim wherever it found a low notch. Now many centuries were required to fill this narrow channel to such a level that the streams were able to flow directly across it and again use their former channels below it. But this ancient rift, paralleling the base of the mountains and underlying all their present streams at right angles, still exists as a deep gravel filled reservoir, high above the general level of the Santa Ana after it has left the San Bernardino mountains. Doubtless this reservoir still receives a portion of its water from these streams as they flow above and across it; but it is believed that a major portion of its supply is from veins in the bedrock discharging directly into the crack at great and varying depths. Nothing can be done within the Santa Ana watershed that would affect in any way the water in this reservoir, from which I and a half dozen neighboring irrigators derive a supply. I have gone thus into the details of a rather interesting situation chiefly for the purpose of proving to the aforesaid court that I am a disinterested spectator from the standpoints of irrigation and flood menace and am therefore not disqualified to discuss the problems of the Santa Ana River, a subject of interest at the present moment because of the recent heavy rains and the resulting damage from overflow in its lower basins.

But while not directly interested in the waters of the Santa Ana, I am still interested in its development and control, because anything which affects the purse of the California Southland as a whole indirectly affects mine. It is for this reason that I now appear at the bar to plead for the utmost possible conservation of water along, and especially at the head-

waters of every stream, including the Santa Ana River.

It is a matter of public knowledge that the Santa Ana has its source in the San Bernardino and Sierra Madre mountains, draining a vast area, a portion at least of which seems almost to belong to the Mojave Desert. So precipitous are these mountains that there are no natural lakes within their confines and only a few places where lakes can be formed by the construction of dams. Because the Creator seemingly was in doubt as to whether the region directly north of

The Windmill Proves Efficient

This is an eight foot aeromotor windmill mounted on 36 foot tower with 3,000 gallon tank on 18 foot tank stand. This is standard unit for domestic service. This plant is on the Callette estate at Montebello. The Shaw-Palmer-Bakewell Company reports many such installations.

Mt. San Bernardino should drain to the north or to the south Bear Valley was left almost level, with the result that the erection of a dam only 70 feet in height made a reservoir seven miles in length, capable of holding the normal precipitation on nearly 80 square miles of watershed.

In the upper Santa Ana canyon, between Bear Lake and Mt. San Bernardino, is the Filaree Flats reservoir site, absolutely the only other place within the Santa Ana watershed where it is possible by the construction of a dam to impound an appreciable amount of water. This site is controlled by the Bear Valley Mutual Water Company, an organization which, as its name suggests, is composed of the people who own and use the water impounded in Bear Lake. It is estimated that a dam at this point 180 feet high and costing \$250,000 would impound enough water to equal a continuous flow of 600 miner's inches for six months. Although there has been no litigation in the matter it is known that no dam has been built here because the people along the lower reaches of the Santa Ana have threatened injunction proceedings, not against the building of the dam, but against the impounding of water behind it if it were built. They have taken the position that the water which would be thus restrained should flow down naturally and sink in the underground basins of the lower river in order that irrigators who pump from those basins may not be deprived of their accustomed yield. It has been contended that the water-level in this lower region should be permitted to rise until water appears at a certain point before the gates of any new reservoir above shall be closed.

At first glance this appears to be a natural and perfectly proper demand. On second thought, and in the language of Sir Roger de Coverly, "much might be said on both sides." Because my own observations, and data which I have, show it to be illogical I purpose saying something on the other side. Again falling into the phraseology of the bar, I expect to prove that if all the water which falls on the mountains within the Santa Ana watershed were impounded and used for irrigating lands within its successive basins from the foothills to the sea there would be more water for the constructive use of everyone in summer time and less to wreak destruction in winter.

Those who attended the recent convention of the League of the Southwest at Riverside, where every phase of the use and control of the Colorado River was discussed, will recall an exceedingly interesting address by R. E. Caldwell, state engineer of Utah, in which he pleaded for the utmost possible conservation and use of the water of mountain streams in their upper reaches. Mr. Caldwell recounted his experiences and observations along the Sevier River in Utah, where a succession of dams and reservoirs has been constructed to impound water for irrigation. This series of dams had its beginning on the headwaters of the stream. When the Piute reservoir, downstream from the Otter Creek reservoir, was begun, people asked where the water was to come from to fill it; and it is a matter of record that, 30 years ago, affidavits were made by many people that they had frequently camped in the dry bed of the river below the reservoir site. To day this same Piute reservoir, holding 100,000 acre feet, is providing water for the irrigation of 40,000 acres of land below it; and the Sevier River bridge reservoir, still farther down the same stream, impounds 250,000 acre feet and irrigates 125,000 acres. No streams of any consequence enter the Sevier River between the two reservoirs mentioned; and yet, in its habitually dry channel of 30 years ago there is now flowing a large stream during every season of the year. It is estimated that 70 per cent of the water entering the lower reservoir return flow from the irrigation lands in the upper portion of its own basin. In a letter received from Mr. Caldwell last week he says: "Last year the two reservoirs were filled at some water was carried over for next season."

Here, surely, is evidence worthy the attention of the people along the lower Santa Ana. Mr. Caldwell says nothing about flood control on the Sevier River—that problem of form years seems to have been forgotten during the recent years of good behavior and beneficent service of the river under control. I am not pleading that it is possible to master the Santa Ana as completely as the Sevier seems to have been. The Santa Ana

U.S. Motors

have won the unstinted approval of Western farmers. A Coast product, built to meet every western condition.

Branch Warehouse at Stockton

in its total length of perhaps 100 miles falls more than 10,000 feet. The Sevier probably falls less than that in its 475 miles. But I am pleading that, with the astonishing record of the Sevier as an indication of what may be expected in the way of return flow, no time be lost in utilizing to the utmost every opportunity for retarding the mad rush of the Santa Ana to the sea.

H. H. Garstin, president of the Bear Valley Mutual Water Company, happens to be a member of the Tri-Counties Reforestation Committee, and in that capacity he has frequently proposed to the people of the lower Santa Ana region that they build the Filaree Flats dam merely as a flood preventive measure, releasing the impounding water as soon after heavy rains as it may safely be done, in other words, to use it in the same way that Devil's Gate dam at Pasadena is to be used. I believe, however, that if the impounding water of Filaree Flats reservoir were spread by irrigation over lands in the San Bernardino and Riverside valleys the resulting increase of water in late summer in the lower reaches of the Santa Ana would be worth the cost of the dam. But the people of the lower reaches need not build the dam. It is understood that there are power interests ready to do that in return for the potential power to be developed thereby. It is stated that the city of Redlands at one time contemplated building the dam in order to develop a water supply for municipal use, it being understood that the right to impound and use the water for domestic purposes could not be called in question by irrigators below. It seems that such a solution would be admirable, because, while forestalling litigation, the water, in the form of sewage, would be returned to the underground channels of the river just as effectively as if used for irrigation. It should be understood that there is no underground channel or avenue of escape to the ocean for the waters of the Santa Ana except through its lower canyon in Orange County. In half a dozen places between this gorge and the point where it emerges from the mountains in San Bernardino County all the water in the stream is taken out and used; and yet, as in the case of the Utah River, it somehow gets back into its channel in large volume.

It is safe to say that no irrigator near the coast would wish to have the stream taken into a conduit before it leaves the mountains and discharged, undiminished by irrigation, just above the lower canyon. On the contrary, the Orange County irrigators have for several years contributed to a fund for spreading and sinking several thousand inches each springtime in the gravel beds near Redlands. It may be said that the whole theory of water conservation in Southern California may be summed up in the slogan, "Retard the runoff." That, in a word, is the service performed by the timber and brush on the mountains and foothills. Any agency which restrains for a time the return of the rainfall to the sea may be likened to a savings bank, while the water companies and irrigators may be likened to the commercial banks. I have yet to hear a commercial banker object to the establishment of another savings bank—for the commercial banker knows that, while the savings bank encourages thrift and prevents dissipation of wealth, it also stands ready to yield its accumulated cash to commerce whenever the need for it actually arrives.

I am constrained to believe that it will be wise to deposit during the winter season the maximum possible amount of water in the Savings Bank of Filaree Flats Reservoir and to check it out and redeposit it in the Savings Bank of the San Bernardino and Riverside Fruit and Farmlands; for it will certainly find its way during the trying days of late summer into the great underground channel of the lower canyon, increasing the flow just as has been done in the Sevier River in Utah. A considerable sum has been expended in Southern California in the construction of check dams, so-called, to retard the runoff of storm water and to stabilize the supply for irrigation. I plead that every available catchment basin in the mountains and foothills be converted into reservoirs and that the irrigable lands below them be used as check dams and stabilizers.

TYPES OF IRRIGATION ENTERPRISES

The types of irrigation enterprises are:

U. S. reclamation service, operating under federal law of June 17, 1902, providing for construction of irrigation works with receipts from sale of public lands.

U. S. Indian service enterprises which operate under various acts of congress for the irrigation of land in Indian reservations.
Carey act enterprises, operating under federal law of August 18, 1894, granting to states in arid regions a million acres of land on condition that the state provide its irrigation. No land in California reported as irrigated under this law.
Irrigation districts which are public

corporations operating under state laws. These districts are empowered to issue bonds, to levy and collect taxes which may be used for construction and operation.
Cooperative enterprises, controlled by water users under organized form of cooperation. This may be a stock company with stock owned by users or membership corporation, one vote per member.
Commercial enterprises which supply water for a consideration to land owners who have no interest in the work.
Individual and partnership enterprises which belong to the individual farmer or to a group of neighboring farmers who control and operate without any formal organization.

A Plant Where the Pump Has Run Two Seasons Without Stopping and Without Even the Slightest Adjustment
American Well and Prospecting Company installation on the ranch of the Montana Ranch Company near Long Beach, Los Angeles County. This pump is known as the Johnston Turbine Pump.

TAKE AN INVENTORY

January is the month to take inventory of the feed and supplies, machinery and livestock on hand. If this information is put down in a simple farm account book and a record of receipts and expenditures kept, the farmer can tell what his profit or loss has been for the year. He can also study his business in the light of this record to see how he can increase his profits for the next year. Let's put our farms on a business basis by keeping a farm account book in 1922.

Use wise judgment by installing your new irrigation pump Now

You probably needed a new pump last year, but Good Fortune succeeded in bringing your crops through without this extra investment. Right now you realize that you must not again take this hazard, but should immediately make arrangements to install a new pump.
Our Water Engineers are ready to assist you. Get in touch with us. Select your pump before you get in the midst of heavy Spring farming duties. Orders placed now assure immediate delivery and ample time to thoroughly test your new plant before the peak of the irrigation season arrives.
Fill out the blank below and we will be able to tell you how much your new pump will cost.

Hardy Avocado

I have become interested in avocados by reading articles in the Cultivator. I have a seedling three years old and doing well enough for the care it gets. The frost nipped the tip end of the top about a quarter of an inch this year. I would like to know which of the budded varieties would be the hardest in Fresno County. The seedling came from a local nursery. Would you advise me to send there for a budded avocado? What month

only? With Gyp corn what fertilizer is best? I have seen planters advertised with fertilizing attachment. Where it is put in furrow or drilled in with the seed, is this a success?—Subscriber, Denair.

We think the only fertilizer which would be of value this late would be a complete commercial fertilizer drilled in at time seed is planted. There are many drills fitted for drilling fertilizer with seed. As to vines, fertilization of the whole surface would probably be the best way for the spread of roots is almost equal to the tops and a small quantity of fertilizer applied in "hill" would have little effect. As to Gyp corn, and in fact these other crops, we believe best

Action at the Rate of 4,500 Gallons per Minute

A 12 inch Krogh pumping plant installed for Walter K. Brown near Salinas. It is pumping from four wells all connected from the one pump and throwing 4,500 gallons per minute.

would be the best to set it out?—Subscriber, Fresno.

Fuerte is the hardest of the large fruited class in as much as it is a hybrid. It will no doubt better withstand the dry summer heat of the valleys, which lacks sufficient humidity for the pure Guatemalans. We would advise sending to the nursery you name for a Fuerte. If you so wish after a year or two of growth you may take buds or grafts from the Fuerte with which to top work your seedling.

results would be secured by crop rotation and building up fertility of the soil by growing alfalfa or other leguminous crops at least one year out of each three or four.

Whitewashing Deferring Blossoming

Was reading an article in the Cultivator in regard to whitewash retarding blossoming. Would like to know if it is too late for doing this. If not, how would one mix the whitewash, or would it be sufficient just to use lime

Planting Zinfandels

I intend planting out a vineyard, Zinfandel wine grapes mostly. Would like to know what one could expect from planting cuttings on good red hill soil with good cultivation and no expectation of rain after May first? How and when should cuttings be planted? Would a person gain by waiting a year and rooting cuttings? What is the best method of rooting cuttings? What portions of the cane should one use for cuttings and how long should cuttings be? Are stakes needed the first year?—Subscriber, Lakeport.

You should not expect good results from the use of cuttings under conditions you describe unless the soil retains moisture exceptionally well. Our advice would be for you to grow cuttings in the nursery row where they can be properly cultivated and, if necessary, irrigated. You will probably have difficulty enough getting a good stand of rooted vines under the conditions you mentioned, consequently you should make every effort to grow good, strong, vigorous rootings. Cuttings are made from sections of the cane, and that part of it nearest the base is preferable, making only one cutting from a cane. It is possible when the vines have made a vigorous growth to make more than this, but if you are looking for the best results make only the one. Cuttings should be approximately 16 inches in length and staking will not be required in the nursery or during the first growing season in the vineyard.—F. K. H.

Fertilizer for Oats

What fertilizer would be best for wheat or oats, and when should it be applied? For watermelons and cantaloupes, what kind would be best, and when and how applied? Watermelons are planted ten or 12 feet apart. Will it do as well to fertilize in the hills

Sectional view of Barton Valve as applied to one make of deep well piston pump. Sizes now in use from 2 1/4 inches to 14 inches diameter.

If you have a Luitwiler Pomona Worthington Deep Well Triplex Wilson & Willard

Or any other make of this type of pump you can avail yourself of a saving several hundreds of users are now making. Will increase the yearly capacity of your pumping plant.

Barton Engineering Co.
715 No Main St. Los Angeles, Cal.

The **POMONA** Duplex Plunger Deep Well Pump has stood the test of time. There are no experiments built into them. The double rods counterbalance each other and the beam motion produces a steady, even up-stroke and a rapid return, and the lap in the stroke prevents the column of water from coming to a stop, resulting in a constant flow of water. Their high efficiency will make a substantial saving in the power expense of any Pumping Plant. **POMONA** Pumps are built in seven sizes.

and water? Also would like to know how long the whitewashing will delay blossoming.—Subscriber, Durham.

There has not been sufficient experimental work along this line to give any very definite information as to results in California. In fact, we have seen denial of the claim that there is any material difference in blossoming period. We would urge trial, however, with a report as to behavior of trees. In any case the difference would be slight.

June Drop

I noticed an article in your January 7, 1922, issue on Scale—June Drop. I do not believe June drop is caused by scale, but by thrips and a fungus that works around the apex of the little oranges. The scale probably helps this along by keeping the tree in a weak, unhealthy condition.

My orchard was in very bad condition, covered with scale this last year. I sprayed the latter part of April thoroughly. The trees were in full bloom. I believe this killed the thrips and fungus, but not the scale, although it probably annoyed them some. About May 5 I examined the trees and found a large per cent of the scale were hatching out. I sprayed again in July, with lime and sulphur, this while the scale were young and tender. That sure got the larger proportion of them. I had some June drop, but nothing to compare with orchards around me that did not spray in the bloom.

I had a fairly good crop of oranges and of good sizes. The truck men said they were the best all around that they had hauled to the packing house. Lime and sulphur is good for the trees and I believe it is the only spray that will kill citricola scale.

Our season is earlier here than in Southern California, so you will have to keep the difference in climate conditions in mind. Hoping this will be of some benefit to your readers, I will gladly answer any personal letters.—H. C. Reynolds, Porterville.

Registration of Pure Bred Hog

Is registration of pure bred hogs denied after they are six months of age?—Subscriber, San Jacinto.

No. The best information in this matter is had from your own breed association, to whom one should write for blanks.

Capacity of Pipe

How much water in miners inches will a 6 inch pipe (inside measure) carry under 12 inch pressure, also under 24 inch pressure? Pipe line has 8 inch fall to 100 feet.—Subscriber, Hemet.

Six inch cement pipe as usually put together in lines for irrigation will carry 7½ miners inches under 12 inch pressure and 10¼ miners inches under 24 inch pressure. This is assuming 9 gallons per minute for one miners inch. If the pipes have been smoothly whitewashed with cement and the joints carefully smoothed the pipes will carry 8 to 10 per cent more water.—J. B. N.

Twin Calves

I have two fine twin heifer calves. Is it advisable to raise twin calves?—Subscriber, Oakdale.

We certainly would raise the calves, that is if they are from fine stock. We think there is no question about their breeding qualities. Where the heifer is twin with a bull, however, it has been a common belief that both may be sterile. This we have heard vigorously denied by some who say that they have seen some of the best cows ever from a heifer twin with bull.

Planting Two Year Olds

Can peach and apricot trees planted out last spring be taken up and replanted without cutting back? I want to use the long pruning system.—Subscriber.

No. We would prefer to cut back and think better growth would be secured. But in any case greatest care should be used in resetting peach or apricot trees which have been set in orchard form during the past year. As a matter of fact nurserymen will not sell nor use for planting trees which have had more than one year's growth in the nursery row. Also we think the slight cost should not stand in the way of purchasing new nursery trees. We would not attempt to move those which are older and at first thought might appear to give better growth.

WANT

It's wanting keeps us young and fit.
It's wanting something just ahead,
And striving hard to come to it,
That brightens every road we tread.

That man is old before his time
Who is supremely satisfied
And does not want some hill to climb
Or something life has still denied.

The want of poverty is grim,
It has a harsh and cruel sting,
But fill the cup up to the brim
And that's a far more hopeless thing.

A man must want from day to day,
Must want to reach a distant goal
Or claim some treasure far away,
For want's the builder of the soul.

He who has ceased to want has dropped
The working tools of life and stands
Much like an old-time clock that's stopped
While time is mouldering his hands.

I'm truly sorry for the man,
Though he be millionaire or king,
Who does not hold some cherished plan
And says he does not want a thing.

Want is the spur that drives us on
And oft its praises should be sung,
For man is old when want is gone,
It's what we want that keeps us young.
Edgar A. Guest.

LOVE AND HONEY

By Ethlyn V. Corsline

HE road was dusty and so was everything within the swaying old vehicle that served as a twice a week stage between the railroad and the scattered ranches back in the mountains. The four rangy horses strained up one hill and rattled down the other only to begin the ascent of a still steeper one. But beneath her dusty traveling suit Alla Dale's heart kept singing. She was going home! Not her veriest own home, she told herself for she had never even seen it, but Uncle Price Monroe was her nearest of kin and he too was all alone. It was early spring and the grass grew green and thick where the chaparral and oak thickets gave it a chance, lupins and poppies waved to her as they passed and tiny yellow faced johnny-jump-ups peeped through the grasses; and still the old stage lumbered on.

The sun was disappearing behind the next hill when the horses were finally brought to a standstill.

"This here's Old Man Monroe's mail box," stated the driver. "I reckon he didn't expect you none for he ain't here to get your boxes. You'd better leave 'em here till morning and you just follow that trail and you'll run right inter his front door."

This seemed good advice and Alla stumbled to the ground trying vainly to find her two feet which seemed to have been misplaced somewhere along her long ride.

She saw her trunk and two boxes dumped unceremoniously beside the post which bore a tattered, rusty square oil can on which was lettered "U. S. Mail. Price Monroe," then turned and followed the narrow trail that wound in and out among trees and brush.

A few minutes walk brought her within sight of a low cabin half hidden among the trees. It was built entirely of trunks of tall straight pines. A great stone chimney at one end promised an open fireplace within while from the opposite end protruded a long length of stove pipe from which smoke was now curling. The door stood open and on the threshold a motherly looking red hen stood clucking lustily to a brood of yellow chicks scattered over the stone steps below.

"Here you, get out of here and go roost in the barn where you belong," came a voice from within, backed up by a "shooing" and footsteps directed downward.

The figure that appeared at the opening stopped short when Alla's laughing voice broke in: "The barn indeed, a pretty place to tell your niece to roost after she has been jolted and dusted and starved all day."

The welcome she received then, left no doubt in her mind as to her uncle's state of mind.

"Lord, but it's good to see ye, Honey," he exclaimed, when he lifted her off her feet in a bearish embrace.

"Why I can lift ye as easy as when you used to run to meet me and rumage through my coat for winter-greens." "Well, I'm a very much grown up young lady, if you please

now, Uncle Price," she assured him as she removed her dust laden hat that disclosed to view a crown of crinkly golden brown hair.

"Moreover I am famished. Did I smell ham?"

Her uncle opened the door at the far end of the livingroom as he answered: "Tain't often I have company, but this is the spare room. Just throw your little bunnit and coat in there and come outside and wash up. Supper's ready in a minute now."

The room was bare with the exception of a little cot, a chair and a chest of drawers. Alla hastened outside and made a hasty toilet with the aid of a wash basin of water from the spring which bubbled up less than ten feet below the house and tinkled away between willow hung banks.

Price Monroe watched her approvingly as she picked up a piece of comb which lay on a narrow cleat beneath the broken piece of mirror tacked to the outside of the house. She looked rather doubtful for a second for several very important teeth of this toilet article were missing.

"I don't keep that here for myself," he chuckled. "Sakes alive, I ain't had any hair to comb for ten years now. I keep it handy tho' for Ralph when he runs in for a bite."

"Ralph?" she queried lightly as she re-entered the kitchen, "a neighbor of ours?" "Yes, our closest, and a mighty fine young fellow, too. He lives about six miles west of here. Here you take this bench, Alla, I ain't any too sure of the hind leg of that chair."

The meal was spread upon a red oil cloth and the dishes were heavy and despite their sturdiness showed the nicks and cracks of a long bachelor reign. But Alla thought she had never eaten such biscuits and gravy or such delicately flavored ham. A plate containing a square amber colored comb of honey was the crowning treat.

"Is this some of your own gathering, Uncle," she asked.

She knew her Uncle's pet hobby was his bees, in fact they were practically his sole source of income during the summer months. They roamed the hills covered with wild sage and brought him their dripping golden treasure. In the winter he hunted and trapped and already Alla had noticed several beautiful skins upon the walls of the living room and thrown upon the couch before the fireplace.

The following morning the traveller awoke to find herself in a new world. The light that filtered into the little square window at the foot of her bed seemed to have taken on the color of the leaves that screened the opening as it sifted through. The whole outer world was a concert hall full of bird song and from the kitchen came the snapping and crackling of a brisk wood fire. Dressing hastily she slipped through the door unseen and followed the little brook toward a cut in the hills. When she came in to breakfast her arms were full of poppies and her cheeks glowed.

"You won't mind, Uncle, will you, if I fix the old cabin over a little?" she coaxed when they had finished the meal, "and I have such splendid ideas for the yard outside."

"You can go as far as you like so long as you let me and the bees alone," he conceded.

"Well, you run along and play with your bees then, while I do the housework, but please bring me my trunk before you start."

When it arrived Alla removed from the top tray a dainty lavender house dress which she had purchased for the express purpose of keeping house. She felt very business like when she was thus attired and attacked the livingroom with broom and mop. The floor looked so bare she decided that at least two of the big bear skins on the wall would be serving to more advantage as rugs. She pushed the heavy home made table from a dark corner to the center of the room and placed her big bowl of poppies thereon. Next she emerged from one of her boxes with a bright colored Indian blanket which she threw over the couch and used another pelt from the wall (a fox this time) to cover the missing rungs in the back of the rocking chair.

When she had finished the place had taken on that homey air that a man

alone is never given though he strive with all his heart. Moreover there were four blisters on a pink palm and a thousand aches in a stiff young back. But Uncle Price's pleasure in the reconstruction paid for all and she planned still further.

"Is there any one around here I can get to spade up some flower beds," she asked the next day.

"I'd be glad to do it for you Honey, but I'm off for all day today and I don't know just when I will find the time but I'll stop in at Jeff Barnes and send him up for you. He's big and strong as an ox but just plain shiftless. Still I guess you can get him to work if anyone can."

He saddled a horse and galloped off up the canyon leaving Alla busy planning her work. About an hour later steps sounded on the path leading to the house. She stepped to the door to confront an impressive figure of masculinity. Standing upon the stone step a foot below the threshold as he did, she found as she opened the door that his clear dark gray eyes were on a level with her own. An olive gray wool shirt was open at the throat and a pair of high laced boots came to his knees. He seemed to stare at her for a second, then fumbling helplessly, reached for his hat. He removed it and still seemed unable to regain his wits. Alla stook the situation in hand at once.

"Good morning," she smiled. "You are very prompt, aren't you, which suits me exactly this morning. Just come with me and I will get you the shovel and show you what I want spaded."

The young man opened his mouth once or twice to speak, seemed to think better of it and followed meekly behind his determined leader.

"Now, right here on this side of the house there is to be a border three feet wide the full length. That is for hollyhocks behind and smaller flowers in front. By the spring here I intend to start a rockery with the crevices filled with ferns. I want all these rocks (pointing casually over a considerable area) gathered and banked about the sides of this hollow. The twisted trunk of that cottonwood is a natural rustic bench but I want boughs placed in such a manner as to form a back. Do you think you can get it all done today?"

"I don't know, ma'am, but I can start anyway."

His voice sounded low and pleasant and Alla found herself noticing that it seemed to blend in perfect harmony with the other sounds of the forest whereas her own always had the effect of something alien.

They worked together the whole sunshiny morning. Her companion had a naive way of explaining the various bird songs that they heard and he seemed versed in all the lore and legends of the country. Time and again she wondered at her Uncle's tone of contempt when he had spoken of Jeff Barnes. This man had no trace of shiftlessness about him and he seemed in every way a gentleman born and bred. At noon they stopped long enough for her to run into the house and bring out biscuits and meat, a pitcher of milk and a plate of ginger bread. They ate by the spring and planned the rockery as they feasted.

So diligent had they been that by four o'clock everything was done that could be until the seeds and slips arrived that she would send for. As he was about to mount his horse Alla appeared with a dainty little silver mounted purse.

(Continued next week)

HINTS FROM HOUSEKEEPERS

Corn Meal

Corn meal cooked thoroughly and poured in loaf pan to cool may be used in many ways beside the one so common of frying for breakfast. We often slice, put in colander or on buttered pans, slide in moderate oven and brown like toast. This with generous supply of butter is splendid for breakfast or supper.

Also I cut the cold meal in cubes about three-fourths inch, add to creamed tuna, chipped beef, etc., instead of toast. It is delicious with creamed lobster or lobster Newburg. —Subscriber, Los Angeles.

Curing Olives Without Lye

When I came to this state 25 years

ago I thought an olive was the bitterest, most detestable thing on earth, but now I often eat one or two right off the tree. By persistent practice in eating them I now prefer olives above any other fruit. To cure them I slit them with a knife on three sides and soak them in pure water without using any lye. I never soak the bitterness all out because I prefer them a little bitter. The vat or pan of water they are soaked in should not be over six inches deep and should be set out in the sun where the direct rays can shine into it. It is the sun that takes the bitterness out. This bitterness of the olive will stop headache, toothache, neuralgia, asthma, cancer, constipation, piles, diarrhoea and many other ailments. The water should be warmed up by the sun every day to change the rotary action. The water should not be changed at all.—C. W. Dayton, Owensmouth.

For Wide Sleeved Coats

The new wide sleeved coats sometimes let the hands and arms get very cold. To prevent this set in a little sleeve, merely a straight piece like the lining, tacked to the sleeve lining at the elbow and gathered on an elastic at the other end where it will slip easily over the wrist.—F. K.

Sunshine Cake

In the last Cultivator there was a request for sunshine cake recipe. Here are two which I find very good:

Yolks of 5 eggs and whites of 7 eggs, 1 cup sugar, 2/3 cup flour, 1/3 teaspoon cream of tartar. Beat whites to a froth and add cream of tartar and beat till stiff. Add sugar gradually, then beat yolks till thick and then add flour a little at a time. Bake about 45 minutes.

No. 2—Beat yolks of 4 eggs until stiff and add gradually 1 cup sugar, beating well, then 3 tablespoons cold water and 1 teaspoon lemon extract or lemon juice. Next mix 1 1/2 tablespoons cornstarch with 1 teaspoon baking powder and 1 scant cup sifted flour. Add these ingredients slowly to the above mixture and lastly fold in the stiffly beaten whites of 4 eggs. —Mrs. J. C. Dames, Fresno.

Carrots and Beets

Perhaps a little suggestion for your table department might be acceptable. When nuts are not to be had for cake or puddings, salads or desserts chopped raw carrots take the place very nicely and supply a nutty flavor, not using too much. May be used in hot or cold dishes. I use it in puddings, cake and gelatines and for garnishing.

I also use grated baked beets. To develop the sugar in beets let the beet become frosted until soft, then bake it. If large, cut in half, turning cut side down. Will be good several days. —Mrs. Jack Filby, Rohnerville.

Uses for Lemons

I was much interested in many uses given for lemons in a late issue of the Cultivator. I would like to add a few more.

For sore throat lemon juice slightly diluted with water as a gargle. For small children a little in a teaspoon or medicine dropper.

For corns bind a piece of lemon on affected part over night.

For bilious or bloated stomach, sour stomach, bad breath, put lemon juice and a piece of rind in a teacup, pour boiling water on it and drink as sour and hot as you can.

For sprained ankle or other sprains first rub gently with a piece of lemon, then lay slices of lemon on cloth, sprinkle with salt and bind on affected parts.

Lemon juice and glycerine, equal parts, makes an excellent hand and face lotion for whitening and softening the skin.

A fourth of a teacup lemon juice and hot water given each morning to children will cure the bad breath so many children have on first arising.

Lemon juice and salt frequently applied will remove from clothing iron rust, mildew, ink stains and some kinds of fruit stains.

Lemon juice and sugar will often relieve hoarseness.

Lemon juice and water will relieve sunburn and tan. —Mrs. F. M. Hubbell, Woodland.

This 50th Anniversary Catalogue is Yours FREE for the Asking

THIS new and complete 50th Anniversary Catalogue will bring you the full advantage of all our Fifty Years' experience in creating low prices on goods of standard serviceable quality.

For every reader of this paper one copy of this book is ready—waiting here to be mailed to you. Simply fill in the coupon below and one copy of this complete Golden Anniversary Book will be sent you Free.

Today the price you pay for goods is a matter of where you buy.

There is no standard for prices since the war. You must compare prices now.

People in large cities compare prices by shopping from store to store. You, too, should compare prices—by having in your home this 50th Anniversary Catalogue.

Every price this book quotes is based upon the new low costs of raw materials.

It is filled with new merchandise bought at the new low prices and puts before the public the right price—the lowest price you need pay for anything you buy.

Everything for the Home, the Farm and the Family

Everything that goes into the home to make it more modern and complete from wall paper to curtains, lighting fixtures to rugs—everything at Money-Saving Prices.

For Men: Everything a man needs from clothing to tools—everything for the farm and farmer's use. Everything at guaranteed, lowest prices of the year.

We picture above your copy of our Golden Jubilee Catalogue.

And on this picture you may read the policy that has been Montgomery Ward's for Fifty Years.

Today this great new-old institution of Montgomery Ward & Co. marches in the lead among all the alert, progressive, low-price-making business houses of America.

It is a house of exports searching the markets with ready cash, buying at today's lowest prices for YOU.

Every page in this great new 50th Anniversary Catalogue breathes the spirit of Ward's—that of progress in service and saving for you.

And this page is published to tell you personally the story of Ward's and the dollars you, too, may save in buying at Ward's. The opportunity is now yours. You need simply fill in the coupon below.

Which is Larger the Sun or a Cent

ONE
CENT

"Why—the sun of course" you will say. But remember—you can hold the cent so close to your eye that you lose sight of the sun.

Some baking powders can be bought for a few pennies less than Calumet—but don't hold these cents too close to your eyes—you will not be able to see the quality—the purity—the dependability of

CALUMET BAKING POWDER

In other words, don't be deceived by a few pennies—the cheapest baking powder in price is often the most expensive.

When you buy Calumet you know that it will produce pure, sweet and wholesome bakings. You know that you use less because it contains more than the ordinary leavening strength.

Buy it—try it—be convinced.

A pound can of Calumet contains full 16 ounces. Some baking powders come in 12 ounce instead of 16 ounce cans. Be sure you get a pound when you want it.

BETTER GARDENS EASY TO KILL WEEDS AND MULCH THE SOIL

Don't do garden work the slow, back-breaking way. The BARKER makes the finest gardens possible—quickly, easily. Simply push along rows (like lawn mower) —8 blades revolving against underground knife destroy the weeds and in same operation break the crust into a level, porous, moisture-retaining mulch. Aerate soil. "Best Weed Killer Ever Used." Has leaf guards, also shovels for deeper cultivation. A boy can run it—do more and better work than 10 men with hoes.

Irrigating the Home Garden

THIS is an irrigation issue. Every department, orchard, vegetable garden, livestock, poultry, this week discusses the necessity and the problems of irrigation. Now is the time for the household department as well to put on its thinking cap and plan for the summer's irrigation needs.

First of all, the home flower beds and the kitchen garden need to be plowed or dug deeply and if necessary leveled so that there will be as little labor as possible in keeping plants growing at their best during the hot days. Permanent ditches are very satisfactory where the housekeeper is also the home gardener and has little time or strength for the outside work.

If you have water under pressure all the time available the watering of the garden with hose and sprinkler may be counted as one of the pleasures and relaxations of the day rather than an added burden.

Mulching of the individual plants and rows of vegetables, berries or roses will retain moisture, keep down weeds and save the labor of cultivating after each irrigation. The ordinary weed growth cut from the garden, wild oats, etc., makes excellent surface mulch. Leaf mold from the canyons or oak groves is the best possible and the half rotted material from the trash heap is always available.

Orchardists depend upon the soil auger to bore down in the ground and find just exactly how far the water has penetrated. It is a curious fact that many gardeners—sometimes not alone the inexperienced—do not realize the fact that the plant has roots which extend one or two or four or more feet beneath it and spread one or two or four or more feet around the stalk, and that those roots must not only be fed but given ample drafts of water. A muddy spot around the stalk of a plant doesn't indicate that the roots one or two or four or more feet beneath it and around it are also thoroughly wet. It pays to get acquainted with your plants, branch and root. Make sure by actual seeing that they are neither over nor undersupplied with water.

Look Over Irrigation Supplies

If the hose is leaking it can be mended, or if it is too far gone, replaced. Hose menders are very cheap and easily handled. Don't wait for George to do it; just get a sharp knife, a pair of pliers, some canvas gloves and wire, and go to it—get acquainted with the hose. A good hose in many short sections is a wonderful back saver and crop grower. If your 50 foot or 100 foot length of hose is too heavy for you to manage, get new couplings and cut it up into 25 foot pieces or less. This will double the life of the hose by saving dragging over the ground. Another thing: It may look shiftless to leave a good hose lying out in the garden instead of neatly coiled on spindle in the shed, but often it means actual economy of time and strength to leave it just where it will be needed next time. One can always manage to draw it under the shade of a tree or the house so it will not blister in the sun. But even the price of a new hose is less than that of an injured back or what is so apt to happen—neglected plants, not watered when dying of thirst because the hose was too heavy to carry to them.

Speaking of short length hose, do you know that you may now purchase two-way and three-way couplings with sprinkler in the center, thus allowing a number of sprinklers to be operated from one hydrant. Think of the time saved in watering the lawn by this method. The underground piping with outlets for sprinklers through the lawn is the ideal method, of course, but not always available because of initial cost. There are many types of sprinklers and it pays to have several adapted to use in different locations; a circular spray is not the thing to use in a corner, for instance; there are others which shoot the water straight in front and may be approached dry shod from the rear.

Where water is drained from the kitchen sink or tubs, a number of short sections and elbows of movable surface pipe are a great convenience, as is also collapsible canvas hose.

When the home garden must depend for irrigation on the regular ditch run it is all the more imperative that the ground be properly leveled now before planting in order to insure a thorough irrigation of all parts. In this case also, mulching will be found to conserve moisture until the next run.

The suggestions regarding the use of hose are made because many California farm homes are supplied with "running water" or water under pressure. No section of the world is so favorably situated as is California. Where the "system" is not installed by a neighborhood and operated under cooperation the farmer should provide it through the erection of a tank or other pressure system. It is due to the housewife that this convenience be given for use inside the home; it is due to all in the farm home because of the lawns, the vegetable and the ornamental gardens which are made possible.

Notice Mr. Reichard's hints on irrigation of the vegetable garden. All the directions there given are true gospel in the home garden. Then in the first issue of each month, as you know, the Cultivator gives, with its planting calendar, directions for seasonal work at that particular time. Hunt up the Cultivator for January 7 and read the garden articles, then watch for the issue of February 4 which will continue the story.

APPLE SAUCE CAKE

A delicious way to fix up apples which will appeal to the family. Use 1 cup granulated sugar, 1 cup apple sauce (4 apples), one-half teaspoon cinnamon, allspice and cloves, one-half cup shortening, 1 egg, 1 teaspoon soda, one-half cup nuts, one-half cup raisins, one and three-fourths cup flour. Cream butter and add sugar and apple sauce. Mix spices with soda and flour. Add raisins and nuts floured to first mixture, then add dry ingredients.

Oil Light Beats Electric or Gas Burns 94% Air

A new oil lamp that gives an amazingly brilliant, soft, white light, even better than gas or electricity, has been tested by the U. S. Government and 35 leading universities and found to be superior to 10 ordinary oil lamps. It burns without odor, smoke or noise—no pumping up, is simple, clean, safe. Burns 94% air and 6% common kerosene (coal-oil).

The inventor, V. S. Johnson, 31 N. Fifth St., Portland, Ore., is offering to send a lamp on 10 day's FREE trial, or even to give one FREE to the first user in each locality who will help him introduce it. Write him today for full particulars. Also ask him to explain how you can get the agency, and without experience or money make \$250 to \$500 per month.

A Word About Sorghums

By H. L. Musser

SORGHUMS generally are of two classes, the saccharine and the non-saccharine. The former are so named because they have a large per cent of sugar; the latter are referred to as grain sorghums because the grain they produce is used for feeding livestock and is listed on the feed market along with other grain. While saccharine sorghums produce a grain it is not offered as food for livestock and is listed in the commercial world as seed for seed purposes only.

The saccharine sorghums are largely grown for the syrup obtained by boiling the sap pressed out of the canes, but more largely for soiling; and since the silo has become of general use they are grown more extensively for silage than for any other purpose. They are seldom put into a silo without corn or some other roughage that contains less sap and no sugar, for the reason that when sweet sorghum is used alone it is liable to excessive fermentation.

Non-saccharine sorghums are more satisfactory for the silo because of the abundance of rich grain that is allowed

and the time and manner of cultivation must be governed by soil and climatic conditions, especially the former.

The tonnage of saccharine sorghums for silage varies according to soil and culture, but 30 tons per acre has been obtained while 15 tons is a high average. Honey sorghum has been pronounced by experts the most desirable for silage. We would say there is no best, for half a dozen growers all having different varieties each would claim he has the best. Of the non-saccharine or grain sorghums, tonnage refers to the amount of grain produced. While there are records of enormous production of each and every variety, practical experience covering a long period of years settles down to the fact that dwarf milo will out-yield in production of grain under either adverse or favorable conditions any other variety, having a record of 8120 pounds of grain from an acre. Two thousand pounds per acre is a fair yield.

If you want green feed for soiling we know that Amber cane is very good from the standpoint of repeated cutting and continuous growth. We

A Pumping Plant At Fresno

to mature before it is cut for the silo and because the stalks are very palatable to stock when it comes from the silo, especially where it has been siloed together with the saccharine sorghums. H. Alexander of Holtville, who is feeding silage of Dwarf milo, states that his dairy cows are giving as much milk as some neighboring cows which feed upon silage of sweet sorghum. He says also that he changed his feed from sweet sorghum to milo without any noticeable decrease in the quantity of milk and his cows are in excellent condition.

There is another class of sorghums known as sorghum grasses, of which Johnson grass is a well known member, but there are many hybrids, and since the introduction of Sudan grass these hybrids showed up in many places and in just as many different characteristics. One of these hybrids was first cultivated by Mr. Benedict of Riverside and later offered by a local seed house under the name of "The Wonder Forage Plant." This has all the characteristics of Amber sorghum with a habit of stooling equal to Sudan grass. It also has a high sugar content but not equal to that of sugar cane. It is truly a wonderful forage plant.

Cultivation

All sorghums require about the same culture, i.e., drill the seed to fall about six inches apart in rows three or four and one-half feet apart. Medium to heavy loam is preferable, but with extra irrigation a normal crop may be grown on a sandy soil, and with intelligent cultivation, together with ample moisture, an enormous tonnage may be grown on clay or adobe soil.

Where the soil is sandy planting may be advisable during April but only after the soil has become sufficiently warm. If the soil is clay or adobe do not attempt to plant earlier than June and then only after the soil has been thoroughly and deeply pulverized.

It is generally conceded that sorghums generally respond well to dry farming. It is also an established fact that a plentiful supply of water intelligently applied, together with proper and timely cultivation, will vastly increase the tonnage per acre. The amount of water, the time to apply,

are not prepared to say that it is the best of the regular sorghums, but we can say from actual demonstration that the Wonder Forage plant greatly exceeds all other sorghums. From the standpoint of soiling it is beyond all comparison, unless it be compared with Napier or Elephant grass under proper culture.

Hardiness

If you would have early feed, your field of sorghum, no matter which variety you have, may be protected so that the crowns will survive the freezing point by allowing a growth of a foot or more to stand over the winter. When danger of frost is over allow the cattle to pasture the roughage, then give the crowns a chance to grow, and you will have early feed. We demonstrated this point with 11 varieties. Five were saccharine, five were non-saccharine, the other, the Wonder Forage Plant. There was little or no apparent difference in their hardiness. Mrs. McConnell of Lankershim gave us the information that there was not a month during the winter that they did not pasture their Wonder Forage. Although it frosted frequently, with a few warm days it would grow several inches. It never stopped growing. The McConnell field has withstood three summers, two winters, and at this writing it is in the third winter and still growing. It was cut twice each summer and freely pastured when not growing a crop.

Poison

The only case of sorghum poisoning that has come positively to our attention during a period of 25 years happened in Imperial Valley when some cattle broke into a field of milo about six inches high. Therefore, it is dangerous to pasture fresh green sorghum, but the University of California in a circular edited by C. M. Haring gives this precaution: "If it becomes necessary to pasture stock on sorghums which are suspected to be in the dangerous stage, the crop had better be cut and dried before being fed to stock, or it may be made into silage. Forage is not likely to prove dangerous when grown with an ample supply of moisture. No losses have been recorded." (Continued on Page 87.)

Something New in Deep Well Turbines

Heretofore Deep Well Turbines have been built in large capacities only, requiring a large motor to operate same, which made this type of pump too expensive to install on small tracts. We have now developed these Turbines in very small sizes, requiring small motors, and offer them at prices which justify their use on very small tracts, or for domestic service, etc. Capacities as small as 75 to 100 gallons per minute from wells as small as six inches in diameter, operated with motors as small as five horsepower can now be obtained; also other sizes for 8", 10", 12" and larger wells, and ranging up to any capacity desired.

Our pump head of new design is of the radial Ball Bearing type, packed in grease and tightly sealed up so lubricant cannot leak out nor dust enter. No other lubrication is required except to pack head bearings with grease at long intervals.

Our new type Grit Proof Bearing results in a freedom from trouble never heretofore found in this type of pump.

Our engineers will advise you fully and without charge on any pumping problem.

Bulletins free upon request.

When Cows are Housed In—Look Out for Disease

YOU cannot afford to have the winter season wipe out the summer's dairy profits. Watch out for sickness; don't overlook the slightest unhealthy symptom. Keep your eye on the milk yield of every cow. A little extra care in winter will keep the entire herd producing at a profit the year 'round.

Cows in barn—with very little green feed, much roughage and concentrates—need every aid possible to keep assimilation and digestion strong. Let these functions lag and the milk yield falls. The cow becomes an easy prey to serious disease.

Kow-Kare is the winter cow-health guardian in the best dairies because it supplies just the assistance needed to tone up the digestion and assimilation and keep the genital organs healthy. Besides its wide use in treating Barrenness, Abortion, Retained Afterbirth, Scouring, Bunches, Milk Fever, Loss of Appetite, etc., Kow-Kare is more and more being used during the winter months as an aid to general health and increased production. It acts directly on the milk-making organs, keeping them normal and healthy.

Kow-Kare costs so little and means so much to cow owners that no dairy should be without a constant supply. General stores, feed dealers and druggists can supply you at the new reduced prices of 65c and \$1.25.

Write for our free book on cow ailments, "The Home Cow Doctor." Make this a dairy-profit winter.

Sent Free Land-Clearer's Guide

This wonderful book—just out—is a real, genuine guide for land clearers. 80 pages full of valuable first hand information, pictures and beautiful colored illustrations. Explains all the best modern methods. Tells when each method should be used to get best results. You may have a copy free. Just send your name—no obligation.

Kirstin One-Man STUMP PULLER

One Man Clears Land Alone. No expensive extra help needed—you can pull the big ones alone. Kirstin One-Man Stump Puller works on wonderful patented leverage principle. A few pounds pull on the lever means tons pull on the stump—it's portable—easy to handle yourself. You alone with a Kirstin can turn your no-profit, tax-eating stump land into more bushels, more income, in your spare time.

The Kirstin line is complete. A model for every job and every purse. Eleven models to choose from. One-man and horse power pullers—all sizes—no job is too small or too big.

30 Days' Trial

You take no risk—30 days' trial protects you. Try it in your own stump field 30 days without sending us a penny—prove without risk what a money saver it is.

Relation of Irrigation to Livestock Production

By R. P. Royce

WHILE the practice of irrigation has been a prime factor in the development of the livestock industry of California, the further development and more economical and efficient utilization of our water resources holds out possibilities of such tremendous importance and proportions as to be but matters for conjecture. The further development of the state as a livestock center will be measured largely by the extension of irrigation practice.

Broadly, the ideal livestock country is one possessing an equable climate and a fertile soil, making possible the growing of a wide variety of feed crops and the uninterrupted growth of animals. Such conditions are present in this state to a greater degree than elsewhere. No country on the face of the globe can boast of more fertile soils and better climatic conditions than prevail in this state. The one limiting factor in our approach to the ideal is the problem of water and fortunately that problem has been and will be solved as conditions warrant.

With water it is possible in this state to have such a succession of crops growing as to provide green feed every month in the year along with maximum yields. The advantage such feed conditions give the California rancher over producers in less favored sections is as obvious as it is important and should enable our ranchers to produce a pound of pork or beef or mutton or butterfat cheaper than their contemporaries of the corn belt and East—and be sure that economy of production is going to cut a larger figure in the future than in the past.

The complaint most frequently heard regarding livestock production under irrigation is that the industry does not pay on high priced land. Doubtless there is some basis for such a feeling on the part of many ranchers, but is it not possible that in the majority of cases the complainant is expecting rather too much? Too often ranchers have made heavy investment in irrigated lands with the idea of engaging in some branch of animal husbandry and for the purpose of their operations have installed a class of livestock no better than used years ago on land rated at a tenth of their present holdings. Under such conditions it is natural that they reach the conclusion expressed above. The very fact that irrigated lands have a high value only serves to make necessary the adoption of more efficient livestock. Then, too, a lot of California livestock producers owning irrigated land have failed to make the most of the opportunities water has given them. They do not keep their fields working hard enough. With ample water there should be slight reason for much land on any ranch remaining idle for any length of time—certainly not if any appreciable profit is expected. Efficient irrigation practice should result in maximum acre production and maximum acre production will sooner or later necessitate rotation of crops and the addition of plant food in the form of fertilizers. With the growing of a diversity of crops it will be found that they can be more efficiently marketed through good livestock with the added advantage of securing the necessary fertilizer to maintain production.

Wider diversification of crops is highly important from a livestock standpoint. Too many irrigated ranches are given over solely to alfalfa production, and as a consequence alfalfa is the sole feed reliance. Now, of course, alfalfa is a valuable feed and should always be regarded as the basic crop on any livestock ranch, but no single feed, not even alfalfa, will give the best results when fed exclusively as is commonly practiced in this state. Under average conditions, and certainly with dairy cows of better quality, less alfalfa and more silage will result in more economical production.

In irrigated sections the production of crops suitable for the silo is so easy and the value of silage in the ration so well established that it is difficult to understand why more of our livestock producers do not avail themselves of the opportunity for cheapening their feed costs. Aside from making possible heavy production of alfalfa the chief value of irrigation

to the livestock men of California lies in the wide variety of heavy yielding silage crops possible through irrigation.

The list of crops well adapted to the silo is extensive, but for practical purposes Indian corn, the sorghums, Egyptian corn, milo, feterita will probably remain the standbys, and the choice will depend upon local conditions covering soil, amount of available water and planting season.

Silage is fed principally in the winter and there is a growing tendency to utilize more or less silage as a summer feed. This practice is to be especially recommended where no pasture is available during the summer. The one weak spot in livestock production in most sections of California is the lack of green feed during the summer. After the fall rains and well into the spring most sections afford green grass, and if a satisfactory plan for filling in those months can be worked out California will come mighty close to approaching the ideal.

So far all too little investigation has been carried on in this state looking to solve this problem. Where alfalfa is available the matter is quite satisfactorily taken care of, but there is a real need for developing more grasses and forage plants suitable for pasture. This need is especially acute in the foothill sections where irrigation is more difficult or impractical under present conditions. Several comparatively new plants appear to hold much promise. Sudan grass, an annual yielding a heavy tonnage under average conditions, is winning many friends. The new annual sweet clover, Hubam, is regarded as having wonderful possibilities. Both these crops with but little irrigation can be utilized as pasture or soiling crops. Other grasses, such as Napier, Rhodes, Smilo, Harding, are still untried in a large way. Several of these grasses have proven quite drought resistant and doubtless under irrigation will prove quite satisfactory.

Another form of feed made possible by irrigation but not generally used by our livestock men is root crops. Roots when properly handled do well in most sections, yielding 10 to 50 tons per acre. Roots require a rather heavy expenditure of labor, and where silage is grown successfully it is a question whether extensive root production is profitable. Roots furnish a succulent feed in the fall and winter and even if silage is fed add considerable value to a ration by reason of their palatability. In general practice early planting, February and March, gives the best results. Mangels are the heaviest yielding roots and are more generally used. Yields above 50 tons per acre are not uncommon.

Next to the mangels the sugar beet furnishes satisfactory yields. If roots are put in late, following a grain crop, the turnip is most satisfactory.

The future relation of livestock development to irrigation appears to be quite clear. It is not so much a question of these two agricultural activities being incompatible by reason of the high investment in land as it is a question of adjusting the two. Under irrigation our lands must be made to produce more in order to realize on the investment, and this increased production necessitates a wide use of livestock—but mark this: the sort of livestock used must be a more efficient type than is now found on our average irrigated ranch.

There is no question but that the bulk of California dairying will continue to be carried on on irrigated farms. Under such conditions the economy of feed production is such that dairying can be maintained at satisfactory profit. It is also certain that the raising of hogs will undergo extension. With abundant cheap protein forage in the form of alfalfa, suggested wider uses of other forage and grain crops, the hog as an adjunct to the dairy industry fits in most satisfactorily.

Beef cattle production presents somewhat different problem. Because of the vast range area represented the foothills and mountains it is doubtful if beef cattle production, that the growing of market cattle, will be taken up very soon by owners of irrigated farms. However, it is likely

that as the demand for better cattle develops many irrigated sections will assume importance as finishing grounds for stock produced on the range, and at the same time it is certain that the majority of our breeding herds of registered beef cattle will be located in the valleys.

Quite the same is true of the sheep industry.

SOUTHERN CALIFORNIA PURE-BRED ASSOCIATION

The Southern California Purebred Livestock Association, organized some two or three years ago, is taking on renewed activity. This association is organized to promote the breeding, sale, exhibition and protection of purebred livestock, and in these objects to use every lawful ways and means

for the benefit and advantage of the breeders of purebred livestock.

Probably its most important activity so far has been the effort for more efficient methods in exhibiting purebreds at the state and other fairs. It will now work along the same lines and in addition look after interests of the purebred whether it be horses, cattle, hogs or sheep.

The affairs of the association are in the hands of a board of directors, each breed being represented by one director. In other words, it is a representative organization, each breed association electing its one director to the board. The board in turn elects an executive committee of five which has charge of the activities of the association. Mr. Michaels of Santa Monica is president and W. W. Van Pelt of Riverside, secretary.

The "Pitiable" Plight of the Farmer?

By Howard Vaughn, Mountain View Farm, Dixon

DURING the past six months the press has repeatedly called attention to the "pitiable plight" of the farmer. He was the first to feel the effects of the readjustment in business which was the inevitable aftermath of war conditions. The farmers of the East and Middle West were considered especially unfortunate by the writers in most papers.

In view of all that has been said and written along this line it has been particularly interesting to me to spend a few weeks in Missouri, Iowa and Illinois, talking with farmers and bankers and attending sales of pure bred cattle, horses and hogs.

It is true that prices for grain crops are lower than for ten years past. This, however, is the inevitable result of a decided overproduction caused by the war. When corn was \$2 per bushel many an Iowa and Missouri farm was put to raising corn almost exclusively. Many a good old bluegrass pasture was overturned that corn might take the place of livestock as its contribution to the wealth of its owner. This general policy, continued for two years after the armistice, has left the Middle West "grain poor" and with a decidedly subnormal supply of livestock. It is an actual fact that the working margin between the price of grain and livestock has never in the past ten years been so favorable to the farmer as it is right now. The "pitiable" thing is not the cheapness of grain; it is rather the shortsightedness of the average farmer in allowing himself to get short on the livestock which will market the grain to so good an advantage.

The inflation of land values in the East during the war has added to the seriousness of the situation for some farmers because at the reduced prices of products it is difficult to pay taxes or rents. This condition is also due to the fact that the majority of farmers must sell grain because they cannot feed stock.

During the war there was a general policy among breeders of pure bred stock of boosting prices and giving notes indiscriminately for their purchases. Many an ordinary cow was sold at \$1,500 to \$4,000, a mark far beyond her capacity to produce in calves. Sales of brood sows averaged over \$600, and in some of them I absolutely know that there was not enough cash exchanged to pay the sale expenses. These conditions, and not present prices, constitute the really "pitiable" plight of the farmer in the Middle West.

But all farmers did not follow such a shortsighted policy. As a class the farmers are far from being broke today. Some, indeed, have become bankrupt and some others undoubtedly will follow in the near future. These, however, are only the extreme plungers, and the fact that these are farmers who went through the war period in every locality to their financial advantage shows that it has been the policy of the man and not the condition of the times that is mostly to blame. The soaring prices for grain and the opportunity for speculation in pure bred livestock proved too great a temptation for many a farmer, and farming became a "game to be played" instead of a legitimate business to be eco-

nomically and carefully pursued, which is its rightful basis.

Sufficient evidence of the stability of farming and livestock business in this country is the outcome of recent public sales. Fifty Shorthorn calves in Wisconsin two weeks ago averaged \$812. Fifty-five Shorthorns in Chicago averaged \$660. Forty Angus cattle made \$360. Some 35 Clydesdale horses averaged over \$600. In southern Iowa, in the heart of the "pitiable" district, a herd of Shorthorn cattle, over 90 head in all, including big and little, good, bad and indifferent, and in rather thin condition, averaged better than \$280. At an ordinary farm sale in central Iowa grade Shorthorn cows made better than \$100 average.

It is true that the lists of buyers in these sales included many names not heretofore associated with good livestock. But this to me is the redeeming feature of the livestock business. New men are beginning to see the value of stock as a means of marketing grain. They are finding in more conservative prices an opportunity to get started in the livestock business to better advantage now than at any recent time. No well bred beast of individual merit has looked for a buyer at a price which will prove very profitable to the producer. If there is any one thing that a trip through the farming districts of the Middle West will emphasize it is the absolute necessity of some kind of good livestock in every permanently successful agricultural enterprise.

FARM DAIRY HOUSES

Farmers Bulletin 1214, "Farm Dairy Houses," contributed from the bureau of animal industry, United States department of agriculture, is filled with plans and descriptive matter of dairy houses. The bulletin says: "The necessity for a milk room separate from the stable arises from the delicate nature of milk. Milk is easily contaminated by stable dirt and absorbs stable odors very readily. If contaminated it may become unhealthy for the consumer and may occasion losses to the producer through souring and the development of bad flavors. It should therefore be removed promptly to a clean, airy place, free from dust, insects, and objectionable odors."

"Building material. A concrete or tile house with an asbestos shingle or slate roof is fireproof, durable, and sanitary. While the initial cost of such a house is high, it is believed to be cheapest in the long run, for it requires few repairs, and no painting. Other materials that may be used are brick, stone, cement block, and wood. The roof may be covered with slate, asbestos shingles, tile, prepared roofing, wooden shingles, or metal. Any of these materials may be used in the plans given if due allowance is made for the thickness of walls of different materials. Outside walls should be of approximately the following thicknesses: Concrete, 6 to 8 inches; brick, 9 inches; tile, 8 inches; stone, 14 to 18 inches; cement block, 8 inches; and frame, 6 inches."

Four years Service Guaranteed!

How the Empire Milking Machine increases Profits and lowers labor costs—
Prices the lowest ever quoted

AN investment that pays for itself long before the guarantee is up—A machine that increases the production from each cow, cuts milking time and promotes cleanliness—

This is the Empire Milking Machine of 1922 with its pulsator guaranteed even against wear for four years' service.

Every farmer who milks six or more cows needs the Empire today to increase his profits. The way to increase profits is to lower the cost of produc-

tion. The Empire—now selling at the lowest price since it was invented—is one farm machine that offers a guaranteed value never before available to the American farmer.

Note the letter above. Hundreds of Empires have been in continuous use for long periods of years.

Look into this money-making proposition today. Go to your dealer and see the machine, or invite him to call on you. Write today for the complete facts and the evidence that Empire users have to offer. Ask for catalog 52-M

Greenwood Durocs

We Will Offer at Public Sale

Jan. 26—31 Bred Sows and Gilts—Jan. 26

Young sows that have raised one good litter of pigs, and gilts that are well grown out and ready to make a good record in the farrowing pen. Our Durocs are known for their easy feeding qualities and prolificacy. We have many testimonials to the fact that GREENWOOD DUROCS MAKE GOOD FOR THEIR PURCHASERS. This will be the season's greatest opportunity to buy quality brood sows at most satisfactory prices. The first sale of the season always offers the best values.

We have a reputation for selling quality hogs. Our Durocs make good in the show ring as well as in the feed lot. We are offering some outstanding individuals of popular breeding, some of them prize winners. Most of them are sired by our well known sire and show boar, Johnson's Defender, Jr., and Western Pathfinder, an excellent breeding son of Pathfinder. They are bred to these boars and to Pathmaster's Sensation.

If you want money making sows attend the sale or send a bid. We will handle bids conscientiously and guarantee absolute satisfaction. Catalog on request.

We will meet Sacramento Northern (at Stafford Station) or S. P. trains if previously notified. Farm on state highway, 3 miles South Live Oak. Sale in comfortable quarters.

Sale at 1 P.M.

The 1922 Guaranty Sale, the annual Pacific Coast Holstein Classic, will be held on Wednesday, April 5, at Rhoades & Rhoades Sale Pavilion, Hynes, which is about 25 miles south of Los Angeles. The committee of selection this year, appointed by F. L. Morris, president of California Holstein-Friesian Association, has four members—R. A. Condee, Chino; W. J. Higdon, Tulare; J. M. Campbell, Escalon, and C. L. Hughes, Sacramento. The committee will start its work of selection at once, and following the rule established in 1921, cattle will be selected only from herds owned by members of California Holstein-Friesian Association. Already members of the state association have expressed willingness to allow a class of cattle to be taken from their herds that will make this sale one of the most notable offerings of the breed ever held in the west.

Bessie Veeman Alcartra Prilly, the wonderful first calf senior two-year-old daughter of the four times grand champion bull, King Segis Alcartra Prilly, has delivered the promised world's milk record in the Bridgford Holstein Co. herd at Patterson, having finished her 365 day test with 27,250 pounds milk and 1061 pounds butter. Her milk production is the world's record in class by a wide margin, and her butter record is the California state record in class by a margin of 128 pounds, and is also the second highest in the world in class. She is of course the most sensational yearly record daughter of her sire to date, but the large 305 and 365 day records being made by her sisters are fast carrying their sire to a place among the top young sires of the breed in respect to long time record daughters.

De Kol Gerben Duchess Gem, owned by Pottenger Sanatorium Co., Monrovia, lately completed a 305 day record of 634 pounds butter from 17,050 pounds milk as a junior two year old, and within eight weeks dropped her second calf as a junior three year old. At this freshening she has made 30.27 pounds butter from 611.7 pounds milk, a splendidly balanced record for both milk and butter.

In order to avoid conflicting with Stockmen's Week at Sacramento the dates of the American Berkshire Congress show and sale at Riverside have been changed to February 27 and 28. The premium lists, which include \$650 in cash prizes and a large number of handsome silver trophies, are being mailed out. W. N. Corea, president of the American Berkshire Association, has a committee at work gathering up a carload of Eastern top notch animals to be sent out here to the show.—Geo. A. Stingle, Secretary Southwestern Berkshire Congress.

Another splendid list of official records has recently been completed in the J. S. Gibson Co. herd of registered Holsteins at Williams. Among them are two daughters of Prince Alcartra Korndyke, the great proven son of Tilly Alcartra, both with records above 30 pounds butter in seven days. The first of these, California State Fair Queen, as a junior four year old made 31.47 pounds butter from 619.5 pounds milk, and is a daughter of Queen Pontiac Charlotte Korndyke, a 31 pound daughter of

King Korndyke Pontiac. The second, Roma Princess Korndyke Alcartra, as a senior three year old, made 30.80 pounds butter from 579 pounds milk in seven days. Inka Tritomia Alcartra Walker, a junior three year old daughter of Prince Alcartra Korndyke, made 22.40 pounds butter from 626.8 pounds milk in seven days. Sigma of Linwood, a full age daughter of Dutchland Hengerveld Sir Gladi, made

HEREFORD BULLS IN CARLOAD LOTS

AT PUBLIC AUCTION

Tuesday, February 21, at 1 P.M.
University Farm, Davis, Calif.

This sale affords the first opportunity in California for buyers of range bulls to buy them in groups suitable for the carload buyer.

There will also be at least 20 bulls sold individually, to take care of the buyer who wants only one or a few head. There will also be about 25 cows and heifers of good breeding for the man who wants to increase his she stuff.

Every Animal Registered,
Transferred Free of Charge,
Guaranteed a Breeder, and Tuberculin Tested.

These choice registered Herefords are consigned by fifteen leading Pacific Coast breeders under auspices of

29.30 pounds butter from 633.2 pounds milk in seven days. Anoakia Hiske Walker, a senior four year old daughter of Merci Lad Korndyke Burke and the 34 pound four year old Lady Hiske Walker, made 26.29 pounds butter from 639.6 pounds milk. The large milk flow present in all of these records is particularly pleasing. The final figures from Mr. Gardner's office give Aaggie Korndyke of Nevada 1297.3 pounds butter from 30,669.5 pounds milk in 365 days, giving her tenth place for milk and twenty-second place for butter for the entire breed, and she is also the twentieth cow of the breed to make above 30,000 pounds milk in one year.

The \$41,000 bull, King Korndyke Pontiac Acme, heading Anita M. Baldwin's herd at Santa Anita, promises to become a sire entirely worthy of his wonderful pedigree. His first calves show a degree of type and uniformity not excelled by the get of any sire we have yet seen in California, and in addition they are beautifully marked and clean cut in appearance. The bull himself is developing fully up to the great promise of his yearling form.

Frank M. Helm's herd at Corcoran is producing excellent official records as the cows freshen. Among the latest are Helm Lady Gelsche Mead, a junior three year old daughter of King Hiske Mead, with 28.51 pounds butter from 486.1 pounds milk; Helm Acme Prilly, a junior four year old daughter of King Mead Acme, with 25.64 pounds butter from 524.9 pounds milk; and Rouble De Kol Juliana, a mature daughter of Prince Juliana De Kol Walker, with 26.56 pounds butter from 510.5 pounds milk. Herdsman Harry L. Redd has a large number now headed toward the test barn.

Frank M. Helm, Fresno, recently sold his 1,100 acre ranch at Corcoran to Southern California buyers who will subdivide it. It is understood that an arrangement has been made with the buyers whereby the big herd of registered Holsteins will not be disturbed for the present.

In a recent letter from H. C. Withrow, Live Oak, he sounds an optimistic note in regard to the hog business and says:

"A keen interest in Duroc sows seems to be developing, and it looks as though there would be a strong demand for bred sows before the season is over. It is the usual thing that the first sale of the season brings less money in proportion to the value of the animals than any of the later sales, and for that reason and the apparent awakening of a demand I believe that our sale on January 26 will be an opportunity to buy good bred sows and gilts. The lot of sows that we will offer are practically all of our own breeding and represent selections and reservations for the past two years. All of the tried sows, with one exception, are young, having raised only one litter. The gilts are mostly yearlings with plenty of size so that they may go right ahead raising two litters a year. We have planned this sale for the purpose of giving nearby farmers a chance to put some sows on their ranches that will make them more money, and to allow them to buy them at prices that they feel they can afford, but there are a good number of sows and gilts in the sale that should not be overlooked by breeders who have need of good sows."

Entries for the third consignment sale of the California Duroc-Jersey Breeders' Association, to be held at the University Farm on February 8, have been coming in, and while it looks as though there would not be enough sows for a very large sale, the consignments so far received represent the leading herds of the state. The sale this year will be another opportunity for farmers and new breeders to get some of the best stock from the best herds of California. Breeders who have not yet consigned are urged to do so at once, as these sales not only stimulate interest in the breed but constitute one of the very best means for getting a herd before the public. All entries must be in within the next ten days so that the catalog may go to the printer. Mail all entries to H. S. Withrow, Live Oak.

A "Knack" for Milking

You know that some hand milkers can get more milk out of the same cows than others. They have this "knack" because they milk uniformly, energetically, and yet with an action that is pleasing to the cow.

You know, too, that it pays to keep the same man on the same cows. A change in milkers usually means a decrease in production, for a day or two at least.

Further than this, you know the cow which is properly milked from day to day will hold up for a longer lactation period.

These facts show that the organs of the cow which secrete milk work best under certain conditions, are very sensitive to change, and that they respond best to uniformity and gentleness. These facts were taken into consideration in developing the De Laval Milker.

The Better Way of Milking

The De Laval Milker is the only method of milking that insures absolutely uniform, good milking—that milks the cows in the way they like best, that milks them as the very best hand milker would, and keeps it up without changing. It is doing so on thousands of farms, whose owners say it pays for itself in less than a year by saving time and increasing milk production. Easy terms. Write for full information.

Valuable Herd Bull

King Paul Korndyke Vale 189268
Will be Sold for Only \$500

You have heard about King Paul Korndyke Vale 189268. He sold for \$2,500 as a calf. Desiring to change herd bulls, we offer this splendid young bull for sale for only \$500 and will sell a son of this sire out of a splendid 23 pound cow for only \$100. Here are two splendid chances to obtain fine herd heading bulls at the lowest prices you ever heard of. King Paul Korndyke Vale is one of the greatest bulls in the world from any angle from which you may study his pedigree. He comes by his size and individuality honestly. His seven nearest dams weighed over 2,000 pounds. His great granddam on both sides of pedigree is the greatest cow in the world of any breed—SADIE VALE CONCORDIA. She was the first cow of any breed to make 30 pounds butter, which was the world's record at the time. She had four daughters, all of which made wonderful records, one of 41 pounds butter. She is the granddam of six 30 pound cows.

His sire, KING KORNDYKE SADIE VALE, considered by many the greatest sire of his generation, is dead. He was known the world over as the only bull in the world with a 40 pound dam, 40 pound sister and 40 pound daughter.

His dam is a 31 pound daughter of SIR SADIE CORNUCOPIA, who is a brother to SADIE VALE CONCORDIA 4th, 41 pound cow, from a 30 pound dam, and sired by a son of the former world's record 34 pound cow, and grandson of the great old show bull, SARCASTIC LAD.

Come and see both animals or write for further particulars to

Wonderful Golden Winesap

You ought to plant some Golden Winesaps this spring. The Golden Winesap has the juicy tartness of the Jonathan, the meatiness of the old Winesap, the beauty of the Winter Banana, the deep gold color of the Grimes and the keeping qualities of the good old Ben Davis. Strong grower, healthy and vigorous. Originated in Utah and should be hardy everywhere. Bears young and very profusely.

True Delicious Apple This is the ideal farm apple. Large surpassed. Flavor sweet, slightly touched with acid. Comes out of storage in April in perfect condition.

Jonathan—One of the very best apples we have. Everyone knows its remarkable qualities.

King David—A very productive variety and a good shipper. Medium size, ripens with Jonathan. Should be extensively planted.

Prices of Apple and Peach Trees

Our trees are unusually healthy, well rooted and with good sound bodies. For the quality, these prices are very low.

LOW PRICES—on all kinds of Fruit Trees and Plants, Vegetables, Flower and Field Seeds, Shrubs, etc. Get our big illustrated Catalog sent free.

SONDEREGGER NURSERIES & SEED HOUSE, 91 Court Street, BEATRICE, NEB.

Peaches: Such well known California varieties as the following:

Elberta—Freestone. Hardy and exceedingly productive. Exceptionally large and fine.

Crawford's Early—Freestone. Fruit very large, oblong, yellow with showy red cheeks. A good bearer.

Mayflower—Clingstone. Earliest in the market. Good size and fine color—red all over. Strong and thrifty grower. Good shipper and always brings highest price.

J. H. Hale Peach—Perfect freestone. Larger than Elberta. Skin thick and entirely without fuzz. Very hardy, bears young and profusely. One of the best for family and the market.

2 to 3 ft. per 1, 25c per 10, \$2.30 per 100, \$20.00
3 to 4 ft. per 1, 35c per 10, \$3.30 per 100, \$30.00

Other sizes proportionately low.

Kinds of Pumps

THE kinds of pumps commonly used to raise water for irrigation are centrifugal pumps, power plunger pumps, deep well pumps, air lift pumps and hydraulic rams. Where the source of water supply is a surface body of water, either a centrifugal pump, a power plunger pump or hydraulic ram will be used; where the source of water supply is ground water developed by wells, usually either a centrifugal pump, a deep well pump, or an air lift pump will be used and in some cases a power plunger pump. For deep wells usually the vertical centrifugal pump placed in a pit or an air lift pump is used. Hydraulic rams are used for small quantities of water such as for domestic purposes or for irrigation of small pieces of land. They are economical in operation, but require special conditions, such as a nearby stream or canal with sufficient fall in a short distance.

A centrifugal pump consists of a circular casing with the inlet or suction end connected to the center and the outlet or discharge end formed tangent to the perimeter. Inside the casing is the runner or impeller keyed on the shaft and revolving with it. It is formed of curved vanes closely fitting the casing. There are two general types: the horizontal centrifugal pump, which has a horizontal shaft; the vertical centrifugal pump with a vertical shaft. When in operation the impeller by revolving imparts a velocity to the water between the vanes and forces it away from the center of the casing towards the perimeter or rim of the casing through the outlet and up the discharge pipe. This produces a partial vacuum at the center of the impeller which induces a flow through the suction pipe into the casing. The number of revolutions of the runner or speed of the pump has an exact relation to the head or lift against which the pump is working and for every head there is a speed for which the pump works most efficiently. This speed can be obtained from the pump manufacturers. It is important that the pump be connected to an engine or motor which will give it the proper speed. Overspeeding is preferable to underspeeding but either reduces the pump efficiency.

Power piston or plunger pumps are used where the water is obtained from a surface source or where the water is near the surface of the ground and the lift to the point of delivery is large. It consists of one or more cylinders, in each one of which a piston or plunger moving backwards and forwards sucks the water into the cylinder and forces it up the discharge pipe. When the cylinder has only one suction valve and one discharge valve, the motion of the piston in one direction causes suction and the displacement in the opposite direction forces the water through the discharge pipe. With two sets of valves so arranged that there is a discharge for each displacement of the piston, the pump is known as a double acting pump. When the pump has two cylinders, it is known as a duplex pump, with three cylinders, it is a triple pump, and in either case may be either double acting or single acting. The cylinders with the driving gears or pulleys are assembled and built at a height above the water plane, which must not exceed the suction lift.

Deep well pumps are used where the water plane is at large depths below the ground surface. A deep well pump consists of a brass cylinder in which operate two plungers with valves. The lower plunger is connected to a solid rod which fits into a hollow rod to which the upper piston is connected. The plungers are so operated by the driving power that the pump is double acting, one plunger moving up while the other moves down, so that there is a continuous discharge. Above the cylinder and connected to it is the vertical discharge or column pipe into which discharges the water passing through the valves in the plunger. The cylinder is about two inches smaller in diameter than the well casing and about one inch smaller than the delivery pipe; the cylinder and delivery pipe are both lowered into the well until the plungers are under water. At the surface the driving power and cir-

cular motion of the belt of the engine is transmitted to the driving rods by means of gears and levers combined into a power head designed to produce overlapping strokes, so as to eliminate to some extent the pulsations, which are further decreased by an air chamber. The size ranges from 6 inch cylinders and 28 inch stroke to 16 inch cylinders and 36 inch stroke. The number of strokes ranges from sixteen to twenty-four per minute, depending on the lift and the size. The maximum lift is 350 feet. The capacity ranges from about 115 gallons per minute to a maximum of 1000 gallons for the largest pump with extra long cylinder.

Air lift or compressed air pumping plants consist of one or more air lift pumps. The air compressor with receiver and motive power and the necessary piping to deliver the compressed air from the receiver to the pumps. Each pump consists of: The discharge pipe, which is smaller than the well casing and is placed inside of it, extending below the water surface to a depth equal to one and a half or two times the lift measured from the water surface; the air pipe, which is usually inside the discharge pipe, but may, if the well is enough larger than the discharge pipe to so permit, be placed outside and connected at the lower end of the discharge pipe by means of standard fittings or special castings; the foot piece which is a special casting connected to the lower end of the air pipe and so designed to admit the air evenly in small bubbles—there are various designs of patented foot pieces, but there is little difference in their efficiency; the tail piece which forms a slightly enlarged extension of the lower end of the discharge pipe below the foot piece. The air is delivered through the foot piece at pressures varying according to the lift and the ratio of diameters between air pipe and water pipe, and its expansion and displacement produces the lifting power. The relation between the volume of air supplied and the volume of water pumped for different lifts has been found by experiment to be as follows:

Head in feet....	10	20	30	50	100
Cubic feet of air.					
Ratio	1.0	1.5	2.0	2.5	3.0
Cubic feet of water.					

The velocity of water in the discharge pipe, based on the volume of water pumped, should not exceed 5 feet per second in order to keep down friction losses.

The compressor may be direct connected to a steam engine or gasoline engine or may be connected by means of belts, gears, etc., to the driving power which may be a steam engine, a gasoline engine or electric motor. The compressed air passes from the air cylinder to the receiver, which is used to store the air and equalize the pressure. From the receiver the air is conducted through pipes to each well.

The efficiency of the plant when properly installed as calculated from the ratio of actual water horsepower to the indicated horsepower in the cylinder of the engine is generally between 20 and 30 per cent. Air lifts are best adapted for pumping from several wells not further apart than half a mile and where the wells are sufficiently deep to allow proper submergence.

The hydraulic ram works on the principle that a large volume of water falling through a low head will pump a smaller volume of water through a higher head. The ram consists of the valve box and air vessel, the supply or drive pipe which connects the valve box with the source of supply and the delivery or discharge pipe which connects the air vessel with the point of delivery. The efficiency of the plant is $E = \frac{q_h}{QH}$ where q = volume of discharge water, h = discharge head in feet above ram, Q = volume of drive water, H = drive head in feet. For best results the ratio of the length of drive pipe to the length of drive head should not exceed 2.5; but it is practicable to increase this ratio to 25 and use a drive pipe 1000 feet long. The delivery head may be anything up to about 250 feet and the drive head anything above 18 inches. The efficiency dimin-

La Habra Heights

Higher and Adjoining East Whittier and La Habra Districts

3,600 acres pronounced by experts the ideal location for avocado and citrus planting. Protected from frost and wind in combination with good soil. Nearly \$250,000 spent on irrigation plant, roads and other improvements. An avocado grove located in our property will be one of the most favorable orchard investments from the standpoint of the net returns that could be desired, as well as the extremely choice location for a country home.

Any acreage desired. Low prices. Reasonable terms.

We also specialize in choice Southern California walnut, orange, and lemon groves. Suburban property.

When Writing Advertisers Please Mention the Cultivator.

ishes as the ratio of delivery to drive head increases. With this ratio as great as 30 to 1 the efficiency will not be over 20 per cent; with a ratio not greater than 4 to 1 the efficiency may be as high as 75 per cent. Hydraulic rams are usually limited to small quantities of water.—B. A. Etcheverry in U. C. Circular 117.

SECOND FOOT, MINER'S INCH AND SOME OTHER THINGS ABOUT WATER

Perhaps not more than one irrigator in ten knows the value of either a second foot or a miner's inch, and often confusion results because of this lack of knowledge.

The term "second foot" is a contraction of "cubic foot per second" and is the rate of discharge of water flowing in a stream 1 foot wide, 1 foot deep, at a rate of 1 foot per second. It is, therefore, a definite and a fundamental unit.

The term "miner's inch" without some sort of qualification is misleading. Since the early mining days in California, the miner's inch was the unit of measure, and it had no definite meaning until it was qualified by "measured under a four inch head." It then had the value of 1/50th second foot of 50 miner's inches, equal to 1 second foot (old law).

On March 23, 1901, the legislature of California passed a law which made the miner's inch equivalent to 1/40th second foot, although there seems to be a desire on the part of many water users to adhere to the value of the old miner's inch, which often results in confusion.

Values

The following list will aid in converting values:

1 second foot=40 miner's inches (new) law of March 23, 1901.

1 second foot=50 miner's inches (old).

1 second foot=7.48 U. S. gallons per second.

1 second foot=448.8 U. S. gallons per minute.

1 second foot=646,272 U. S. gallons per day.

1 second foot=approximately 1 inch in depth over 1 acre in 1 hour.

1 second foot=1.983 feet in depth over 1 acre in 1 day.

100 California miner's inches (new) =18.7 U. S. gallons per sec.

100 California miner's inches (new) =4.96 ft. in depth over 1 acre in 1 day.

1 California miner's inch (new)=11.22 gallons per minute, though in general practice the irrigator figures on a basis of four inch pressure which would be nine gallons per minute.

100 U. S. gallons per minute=0.223 second foot.

100 U. S. gallons per minute=8.92 miner's inches.

1 acre foot=43,560 cubic feet=1 foot deep over 1 acre.

1 acre foot=325,850 U. S. gallons.

1 cubic foot=7.48 U. S. gallons.

1 cubic foot water weighs 62.5 pounds.

A gallon of water, U. S. standard, weighs eight and one-third pounds and contains 231 cubic inches.

A cubic foot of water weighs 62½ pounds and contains 1728 cubic inches, approximately seven and one-half gallons.

To find the pressure in pounds per

square inch of a column of water multiply the height of the column in feet by .434. Approximately every foot elevation equals one-half pound per square inch.—Brown Book of Martin Iron Works.

IRRIGATION IN CALIFORNIA

Of California's 117,670 farms 67,391, or 57.3 per cent, are irrigated. The number in 1910 was only 39,352, an increase of 28,039, or 71.3 per cent.

The area under irrigation in this state on January 1, 1920, was 4,219,040 acres, an increase of 1,554,936 acres over the irrigated lands of 1910.

The figure above gives the number of acres under actual irrigation while the area included in enterprises is 7,805,207 acres.

Only 4.2 per cent of the land area of the state is under irrigation.

Capital invested in California irrigation enterprises, \$194,886,388, an increase of 168.5 per cent over the investment of 1910.

Estimated final cost of all enterprises will be \$225,799,123.

Average per acre cost of enterprises, \$33.06.

Average cost of operation and maintenance per acre of California irrigation, \$4.40.

GRAPE EXCHANGE ELECTS NEW DIRECTORS

At the January 11 meeting of the California Grape Growers' Exchange, the new directors selected are: E. G. Smith of Geyserville, representing Lake, Mendocino and Sonoma Counties; H. J. Klein of Napa, representing Napa and Solano Counties; Frank T. Swett of Martinez, representing Contra Costa and Alameda Counties; Eugene Frye of Elk Grove; C. L. Crawford of Ukiah, and E. M. Sheehan of San Francisco, directors at large. E. M. Bowles of San Francisco was chosen to represent the state market director on the board.

Problems taken up by the growers at this annual meeting were marketing of consignments of grapes by the exchange, pooling of crops, suits instituted by the exchange, and a membership campaign.

FRUIT TREE CATALOG (65 Pages)

Fully Illustrated. Contains much information of value to planters
Sent FREE on request

In preparing our 1922 catalogue, it has been our desire to make it not only a descriptive book telling the kind of stock we grow, when and how to plant and care for it, the prices at which it sells, and the effects it will produce, but also to give our many customers information showing how the stock itself is produced, the care that has been exercised in its building, together with lots of little helps heretofore not found in any nursery catalogue.

POULTRY

Baby Chicks—When you buy baby chicks the big thing for you to remember is QUALITY, in both the chick itself and the parent stock. By investigating you will find that our chicks are in a class by themselves; for we have absolutely the best equipment obtainable to produce them and very high class stock from which we get our eggs, and then, too, we know how to handle and deliver chicks. We are hatching every week White Leghorns and Anconas that will lay; R. I. Reds and Barred Rocks that are well bred and will produce. Send for our circular and prices and order immediately for 1922 delivery. **ORANGE COUNTY HATCHERY, Santa Ana, California.**

White Leghorn Baby Chicks from a flock of California's best layers. This flock has been bred and selected for 8 years. Our chicks are the best. 25 chicks \$5; 50, \$9; 100, \$16; 500, \$75. Barred Rocks and Rhode Island Reds \$20 per 100. All chicks delivered by Parcel Post prepaid. Write for circular. Established 1915. **Hargett & Son, Route 2, Box C, Compton, California.**

Walter Hogan Stock White Leghorn Chicks. December and January chicks come from winter layers. The cockerels are in the market for early broilers. You can have the chicks out of the brooder house in time to put in a Spring brood. We are hatching the chicks and ship by Parcel Post, safe arrival guaranteed. You can do what others do—make money with poultry. **Lyon Hatchery, Gardena, California.**

We Are Now Booking Orders for S. C. White Leghorn Baby Chicks, from strong, healthy, vigorous stock. Bred especially for heavy egg production, from two hundred to two hundred and eighty egg strain. If you want strong, healthy baby chicks, place your orders with the Vineburg Hatchery. All baby chicks guaranteed safe delivery. **Vineburg Hatchery, Vineburg, California.**

Santa Cruz Chicks—Our Specials are White Leghorns, Buhrman's White Wyandottes and "Hill Crest" Reds, but also hatching, choice Brown Leghorns, Anconas, Buff, White and Black Minorcas, Barred and White Rocks and Reds, Buff Orpingtons. Greens for Hens and Chicks

By Jean A. Koethen

GREEN feed, poultrymen and investigators are finding out, is the sine qua non of poultry raising. If one grain is not available another may take its place. Milk takes the place of meat and vice versa. There are mashers galore, some better, some worse. The one essential feed that cannot be changed nor substituted for and without which success is impossible is green feed. And green feed cannot be raised without water. In a rainy season barley can be grown without irrigation, but for other greens, year in and out, green feed means irrigation, and the poultryman who attempts to produce eggs on soil that cannot be irrigated is doomed to failure. The term "green feed" does not mean dried beet pulp nor even sprouted oats nor alfalfa hay, useful as these are in their place. It means green alfalfa, and barley growing up out of the ground a foot high at least, kale as high as your head, and chard with big, succulent green leaves. Green means succulence and succulence means water. The more water the more succulence and the more vitamins.

Vitamines Mean Health

Success with poultry centers largely around health, and health, it seems, depends very largely, for chicks as well as for children, on the vitamins in the diet. Just what vitamins are nobody seems to know exactly, but they are something that is found in green vegetables and in fresh fruit, something absolutely indispensable to the health of most forms of animal life. When you say "I feed my hens green feed when I can get it" you are confessing your own responsibility for their sickness or their non-productiveness. Hens that have all the greens they can consume, as is the case generally with hens on range, will often produce a good many eggs without mash and with very little grain, not because the green contains egg material, but because it keeps the system in the condition to do the very best work with whatever egg material it receives.

The Alfalfa Patch

The one best green for chickens is alfalfa. If every poultry raiser had a patch of alfalfa, and the alfalfa could be cut every month in the year, the green feed problem would be solved once for all. Most people who keep chickens can also have a patch of alfalfa, but unhappily alfalfa is dormant from October to April, and some other green must be substituted during these months. Alfalfa may be planted from January on, and this season, which promises to be a wet one, should see every backlot poultry plant supplemented with its patch of alfalfa. Though the space available be only ten feet square, plant it, water it abundantly and see what a nice lot of green feed your chicks will get from it. If you have a vacant chicken yard, or a corner that can be fenced off, plant it and give your chicks a chance to run on it. I have seen in some plants where space was very limited a little yard of this sort kept for the different broods of chicks to take their turn on for a short time each day, and I remember one large breeding plant which had a little patch of alfalfa not over two feet square, wired over, in each pen. There is many a corner, even in a city lot, that might be made to grow alfalfa if its owner only realized its importance. A single alfalfa plant, such as I had growing over my backyard fence one summer, will grow to a height of three or four feet if allowed all the water it can drink up, and may be cut again and again for baby chicks.

Alfalfa contains more protein than any other green feed except clover. Its crude protein content is 4.94 per cent, while that of barley is only 2.70 per cent and that of lettuce is 1.20 per cent. Alfalfa is therefore valuable not only for its vitamins but because it contains real egg material.

Cut Green Barley

For the season when alfalfa is dormant the poultryman's best dependence is barley. Every vacant chicken yard, every available bit of unused ground should be planted this month to

barley. It grows rapidly when rains are frequent, without irrigation, and each stand can be cut three or four times. One poultryman I know, who has two yards for each laying house, plants one to barley in the fall, cuts three times and then turns the hens in to eat up the roots. As soon as his hens are in this yard he plants the other. In a dry year barley can be irrigated, but most seasons the rains are sufficient to insure a good stand, especially on the well fertilized soil of poultry runs.

Poultrymen who make the greatest success with their chicks plant the chick runs to barley in the fall so that when the chicks are hatched in January or February they find the grain ready to run in. Chicks that can run in a grain field always make the most rapid growth. If any one doubts this let him try running one flock in the barley field and the next in a bare yard. A patch of alfalfa should supplement the winter barley patch, but the two together make an ideal provision for greens for either chicks or hens. Both alfalfa and barley are run through a green feed cutter and fed in troughs or hoppers.

Kale to Piece Out

There are times when the alfalfa has been cut to its limit, and a transition period when barley does not grow quite as well, and alfalfa is not ready to cut. For these times, and for other times when a change seems desirable there is nothing quite so good as kale.

Kale is a heavy feeder and a great drinker and to be of great value must be well fed and watered. It may be planted in boxes in fall or winter, but there is nothing to be gained by transplanting before March. As soon as it has begun to grow irrigation should be commenced. After the first irrigation pile on poultry manure, and in two or three weeks (depending on the season) irrigate again. It is not possible on a sandy soil to overirrigate or overfertilize kale. It will take all you give it and call for more, and the more it gets the faster it grows. For producing a great deal of green feed on a small plot of ground nothing can excel the thousand headed kale, but most poultrymen prefer alfalfa, perhaps because it is the better feed, perhaps because it is raised with less work and less water. I understand that in the Petaluma district kale is used far more than in the south.

Other Greens

There are other greens which may be planted for hens, but they are not important. Some poultrymen prefer lettuce to alfalfa for baby chicks, and for the early chicks alfalfa is not available. I have heard it objected that lettuce makes chicks "dopy" because of the opium it contains, but lettuce has been so long considered the very best green for chicks that I doubt the validity of this objection. Lettuce can be bought so cheaply from the truck gardeners, however, that it is hardly worth while planting it for chickens. If it is raised for the family table the waste leaves can be utilized for the chicks, but the backlotter who does not understand how to raise it successfully had better leave it to other hands. Chicks that have any kind of green range need very little other green. Nothing that is cut and thrown in to them quite takes the place of what they pick for themselves.

Chard, like kale, may be planted for supplementary greens, but it requires just as much water and produces less to the plant. It is better than kale for chicks, and a few rows will be worth while if there is room for them. Chard may be planted in boxes in January and February but does not transplant well till the soil is quite warm, say from April on. Successive transplantings may be made throughout the summer.

Spineless cactus and Sudan grass have been tried by a number of poultrymen, and Sudan grass at least has made good for summer use. It is quite susceptible to frost and should not be planted till April or even later. Spineless cactus cut and thrown into the yards for the hens to pick at is better

than no green at all but hardly fulfills the condition of succulence which is demanded of chicken greens.

Rid Setting Hens of Lice and Mites

Wonderful New Remedy Banishes Lice and Mites without Dusting, Spraying or Greasing.

Lice and Mites cause many poor hatches. Setting hens, infested with them will often leave their nest at the most critical time. Many dusts, sprays and dips are so strong that they often make eggs unhatchable. It is now easy to keep your setting hens, as well as the rest of the flock, absolutely free from all lice pests, and that too, without any trouble of dusting, spraying or greasing. Settings eggs in no way affected.

A few drops of this wonderful Imperial Lice and Mite Remedy given occasionally to fowls in their drinking water, keeps them entirely free from all vermin. It is guaranteed not to affect the eggs or flesh. On the other hand, it acts as a splendid spring tonic and blood purifier. Lice, mites, ticks and other vermin positively will not stay on any fowl that takes this remedy.

Fine for Baby Chicks, Too

By all means protect your entire flock, especially setting hens and baby chicks, from the ravages of Lice and Mites by using this wonderful discovery—Imperial Lice and Mite Remedy. You can do so without risking a cent, as it is fully guaranteed.

White Diarrhea Remedy Free

Send only \$1.00 to the Imperial Laboratories, Dept. 526, 2110 Grand Ave., Kansas City, Mo., for a regular full sized, (double strength) \$1.00 bottle, postpaid. And further, as an outright gift to acquaint you with its merits, they will also send you entirely free, a regular \$1.00 package of Imperial White Diarrhea Remedy. If more convenient, you need send no money; you can pay the postman \$1.00 and a few cents postage on delivery of the package containing the two remedies. You need not hesitate to accept this offer, as the return of your money is absolutely guaranteed if you are not entirely satisfied.

Stop Hatching Weak Chicks

Chicks that hatch out weak and wobbly, and live but a few days mean nothing to you but trouble and loss.

Queen Incubators

produce large hatches of strong, vigorous chicks that live and grow. The Queen is accurately regulated—taking care automatically without attention of a variation in temperature of 70 degrees without danger to the eggs. It is built of genuine Redwood—very scarce in these days of imitation. Redwood does not absorb the odor from hatching chicks. Cheaper woods and strawboard or composition lining in iron or tin machines, retain the odor, to weaken and kill the chicks of later hatches. Queen Incubators and Brooders are sold by dealers everywhere. Send for Free Book. (42)

Poultry Queries

Conducted by Jean A. Koethen

Roup

What shall I do for roup which has appeared in my flock of 1200 hens? Will separating them into smaller flocks keep the disease from spreading? How many should I put in a flock?—Subscriber, Wasco.

Putting the roup birds by themselves will help, of course, to check contagion, but as long as conditions are unsanitary you cannot altogether stamp out the disease. What I am trying to say is this: Your birds have roup because something is wrong with your housing or management. Perhaps you are keeping too many in a house; perhaps your house is not properly ventilated; perhaps it is dampness in the houses or standing water in the yards that has caused the birds to take cold; perhaps your house is not kept clean enough. You will have to find out for yourself what the cause is and then remedy it. Filth and dampness are the two great fundamental causes of roup, but drafts and crowding are often responsible. If by putting the birds in smaller flocks you can lessen the crowding you will find the disease easier to cure, but the mere fact that you have 1200 birds running together does not necessarily account for their illness. Put the sick birds in the sunniest, warmest, cleanest place you have, give them plenty of greens, and once a day dip their heads in the permanganate solution so often recommended in this column. Put a few crystals of potassium permanganate in a lard pail or quart measure filled with warmish water, and dip the head in this for a few seconds, first massaging the nostril to loosen the secretion. The permanganate solution cleans the passages and gives them a chance to heal, but you cannot expect a permanent cure till you have removed the cause.

Scaly Leg

Do young pullets have the disease called scaly leg?—Subscriber, Tulare.

Yes, pullets seem to be rather more susceptible to this disease than old hens, though it is always passed on from an older hen to the pullets. Rubbing the legs and feet every few days with an ointment made of 1 part oil of caraway and 5 parts white vaseline is the best remedy. Another ointment that is recommended is equal parts vaseline and zinc ointment. If yards are kept clean and no bird with this disease taken into the flock it is easy to eradicate it by persistent treatment.

Egyptian Corn

What is the proper amount of Egyptian corn to give to six R. I. Red pullets just starting to lay? They have green feed night and morning and meat when we can get it. Would you advise any other kind of feed or any laying mash?—Subscriber, Tulare.

A laying mash should be kept before the pullets. Any one of the prepared commercial mashes will do, through it is better to add 50 per cent bran at the beginning and gradually diminish the amount as the pullets settle down to their work. Two or three kinds of scratch grain are better than one, say equal parts wheat, barley and Egyptian corn. Too much corn of any kind is not good for layers. If you use a mash containing meat scrap you do not need fresh meat, but a little green cut bone once a week is a good thing and will help increase production. To six hens you should give less than a pint of grain per day.

Bare Backs

The feathers are worn off the backs of my best pullets. Will they come in again before next fall? I have four roosters with 92 hens. Is that too many? Does a capon ever bother a hen?—Subscriber, Lancaster.

If you took the hens away from the males the feathers would probably come in again before the regular molting time. As long as they remain in the flock they have no chance to grow. Four males with 92 hens may not be sufficient. Most poultrymen allow from 20 to 25 hens to one male. You can only tell by the fertility of the eggs how many males are needed.

If many eggs test out clear add another male to the flock. Capons are unsexed and will not bother the hens.

Smut in Wheat

Will chickens eat the smut in wheat when it is scattered on the ground?—Subscriber, Lancaster.

There seems to be no rule as to just what chickens will eat and what they will leave under any given set of circumstances. It depends on how hungry they are and how they have been trained. For instance, my hens will not look at the tenderest, juiciest worm. They have not been brought up to eat worms and I cannot persuade them to touch them. It is much safer not to feed smutty wheat. You cannot tell how much the hens will eat, and if they do eat it the consequences may be disastrous.

Broken Eggs

Since last spring we have lost eight hens, some White Leghorns and some mixed. The Leghorns droop a few days and die quickly; the others have the same symptoms but live till they are mere skeletons. One that was examined contained in the region of the oviduct what looked like a hard fried egg with mold inside. A large R. I. Red has now the same symptoms, and the last egg she laid was shoft shelled with a mass of what seemed to be the white of another egg. We feed a laying mash, wheat, Gyp corn and cracked corn, and an abundance of green. Some of the cracked corn has been moldy but the hens had very little of it.—Subscriber, San Jose.

A shock or injury is generally believed to be the only cause of eggs breaking in the oviduct, but Dr. Beach of the poultry division of our state college of agriculture stated in discussing epidemics of cholera in certain flocks that in many cases of this disease a broken egg was found in the oviduct. Whether the broken egg was the cause of the attack of cholera or the disease was itself the cause of an abnormal condition in the oviduct he did not make clear, but he did say that a general cleaning up was the only satisfactory cure for these epidemics. Whatever your hens have or had, moldy corn is bad for them and should not be fed under any circumstances. I think too that you may be feeding too large a proportion of corn in the ration. One-third corn is enough at most times, and a quart of grain daily for 16 or 20 hens is better than more.

SOUTHERN CALIFORNIA EGG LAYING CONTEST

The production of eggs at the Southern California farm bureau egg laying contest at Pomona has been increased somewhat during the month of December with a production of 23.55 per cent. Some interesting things have developed during the month also.

First ribbon for the bird laying the most eggs during the month of December goes to a Rhode Island Red pullet belonging to Ferd Heying of Anaheim. This bird began her year's record by laying two double yolked eggs on the last three days of October. One of her November eggs and three of the 26 eggs which she laid in December were also double yolked. She now weighs six and a half pounds and her normal eggs weigh on an average more than 28 ounces to the dozen.

Three White Leghorns with a production of 25 eggs each tied for second place and on the basis of the previous month's record A. L. Swinton's bird wins second ribbon and Geo. C. England's bird third ribbon. The latter bird, which made the highest record in October, took a straight two weeks' rest in November but came back strong enough to tie for second place in December and also make the highest record, 68 eggs, for the three months. B. S. Smallwood's bird, which holds second place for the three months' production with a record of 66 eggs, has laid in perfect cycles of three eggs in four days since the twentieth of October.

A gradual increase in the egg production of the contest flock during December resulted in a 23.55 per cent production for all birds for the month. A record is now being made of Leghorns and Anconas laying tinted eggs. (Continued on Page 87.)

At Last!

A Spray That Equals Fumigation

After many months of patient labor and grievous disappointments the chemists of a Los Angeles Laboratory have successfully perfected a hydrocarbon emulsion spray which combines the effectiveness of fumigation with the economy and ease of spraying. It positively will not injure the most tender growths nor mar the beauty of bud or blossom. It is non-poisonous and non-inflammable, and what is very important, the component parts of the spray will not separate. The ingredients are of the purest and best and are so combined that the finished product will mix with water in all proportions.

This spray has been aptly named "FUMISPRAY" for this very good reason—for a considerable time after

spraying fumes are thrown off which act as effectively as direct contact of the liquid—thus every tiny crevice is FUMISPRAYED!

FUMISPRAY kills by contact and fumes the following parasites—Oyster Shell, San Jose, Purple, Black, Red, Brown, Cottony Cushion, and Scurfy Scales; Green, Black, and Woolly Aphis; Thrips; Red Spider; White Fly, Pear Psylla and other forms of insect life.

FUMISPRAY is the last word in insecticides. Do not confuse it with any other spray on the market. We guarantee you satisfaction. Sold in large or small quantities. Write for prices.

Apples: Demand and movement light, market dull. Locals: Winesaps, Romes and King Davids, mostly 4@5; Delicious, 6@7; few 8@9 lb.; B grade Delicious, 2.50@2.75; fancy, 3.25@3.50; Winesaps, fancy, 2.75@3.00. Watsonville: Fancy, 3½ and 4 tier Bellefleurs, 1.60@1.75; poorer, 1.40@1.50; 4½ tier, 1.35@1.45; loose, per lb., 3½@4½; fancy, 4 tier, White Winter Pearmain, 2.00; Yellow Newtowns, fancy,

2.10@2.25; B grade, 1.65@1.90. Northwestern: Spitzenburgs, medium to large, extra fancy, 3.25@3.50; fancy, medium to large, 2.75@3.00; Winesaps, extra fancy, medium size, 3.00; small size, fancy, 2.50; Romes, extra fancy, 2.75@3.25. Pears: Winter Nellis, 5@8; Kieffers, 7@8; Comice, 7@8 lb.

CITRUS FRUITS

Grapefruit: Movement slow, market dull. Californias, Northern: Packed box, 2.75@3.00; small, 2.50; market pack, 2.00@2.50. Imperial Valley: 4.00@5.00. Arizona: Seedless, 3.75@4.75, according to size and quality.

Lemons: Demand and movement slow, market steady. Locals: Loose boxes mostly 1.25@1.50; poorer, 1.00; lugs, 40@50; few best, 75.

Oranges: Demand limited for packed stock, market weak. Navels, special brands, 100s-150s, mostly 3.75@4.00; 176s-216s, 3.50@4.00; market pack, 2.25@3.50, according to size and quality; culls, field boxes, best, 1.00@1.25; poorer, 50@75.

Tangerines: Demand and movement light, mostly 4½@6 lb.; few fy., 7½@8.

HAY

Alfalfa Growers of California report: Market past week did not show improvement expected as result of improved weather and shipping conditions. Receipts continued almost as light as during the rains, which means that they were again materially below requirements for

current consumption, thus further reducing reserves supplies of buyers. This explanation probably is that in some of the producing and shipping sections conditions are still unfavorable for baling or hauling, but the principal reason would seem to be that the stocks remaining in growers' hands are very light in the aggregate. This has greatly reduced the number of shippers and is therefore making the movement irregular. It will probably continue so during the balance of the old crop year.

There were 1,100 tons of grain and alfalfa hay received on the Los Angeles tracks the week ending January 14, with 190 tons held over.

Prevailing prices last week, delivered in the vicinity of Los Angeles:

No. 1 dairy alfalfa.....25.00

Standard.....20.00

Quotations by Nichols-Loomis Company. Following are prices to growers f. o. b. Los Angeles in carload lots, handling and commission must be added to obtain retail prices on new hay.

Beans: Poorer, 10@15; Florida, fir quality, 40@50; limas, 6@10.

Peppers: Bells, best, 20@25 lb.; chili 15@17½ lb.

Potatoes: Rivers, fancy, 2.15@2.35; Oregon Burbanks, 2.25@2.40; Idaho Netteed Gems, 2.60@2.85.
Pumpkins: Per sack, 75@1.00 per 90 lb. sack.
Rhubarb: 2.75@3.00 per apple box; off grades, 1.75@2.25.
Squash: Summer Brawley, 3.00@3.50, small crate; cream, 75@1.00 per lug; Hubbard, 1.00@1.50 per 90 lb sack.
Spinach: 9@10 per lb.
Sprouts: 7@9 per lb.
Sweet potatoes: Per cwt., 3.75@4.00.
Tomatoes: Repacked, Southern, best, 2.50@2.75 cr.; Mex., lug, 2.75@3.50.
Turnips: 90@1.15 sack.

FRESH FRUITS

Prices furnished by state department of agriculture, division of markets:
Sales to Retailers: Below are listed averages of actual prices obtained between 7:30 and 9 o'clock this morning by wholesalers from their sales to retailers, hotels, restaurants, cafeterias, etc. Terms: Cash on walk. Slight fluctuations may be noted during the day's trading, while higher prices are sometimes obtained where credit is given or goods are delivered.

Apples: California Newtown Pippins, 4 tier, 1.85@2.00; 3 1/2 tier, 2.00@2.20; 4 1/2 tier, 1.65; B grade, 1.00@1.50. Langford Seedlings, 4 1/2 tier, 1.10@1.25; 4 tier, 1.40@1.60. Northwestern: Newtown Pippins, extra fancy, 3 1/2 and 4 tier, 2.40@2.65; fancy, 2.15@2.40; choice, 1.60@2.00; Spitzenburg, extra fancy, 2.25@2.65; fancy, 2.00@2.25; Rome Beauty, fancy, 2.00@2.25; choice, 1.50@1.75; banana, extra fancy, 3.25@3.50; fancy, 2.75@3.00; Delicious, fancy, 3.50; Jonathan, nominal (practically off the market).
Avocados: California, large, 6.00@8.00 per doz.; medium, 4.00@6.00; small, 2.50@4.00.
Bananas: Eastern, 7@7 1/2 per lb.; red, 3 per lb.; Hawaiian, 7@7 1/2.
Cranberries: Slow, 4.50@5.50 box; 1/2 bl. Cape Cod, 17.50@20.00 per bbl.
Pears: Winter Nelis, 1.75@2.25 per box; Beurre Clairgeau, 1.75@2.50; De Anjou, .50@2.25; poor storage, 1.00@1.75.
Pineapples: 5.50@6.00 per doz.
Pomegranates: Storage, 1.50@1.75 per small box; poorer, 1.25@1.50.

CITRUS FRUITS

Prices furnished by the state department of agriculture, division of markets:
Sales to Retailers: Below are listed averages of actual prices obtained between 7:30 and 9 o'clock this morning by

wholesalers from their sales to retailers, hotels, restaurants, cafeterias, etc. Terms: Cash on walk. Slight fluctuations may be noted during the day's trading, while higher prices are sometimes obtained where credit is given or goods are delivered.

Lemons: Special pack, fancy, 3.25@3.75; others and poorer, 1.50@2.75; lemonettes, 1.25@1.75. Oranges: Special pack, 126s-200s, fancy, 4.00@4.50; 150s, 3.75@4.00; 200s-216s, 3.25@3.75; choice, 2.25@2.75. Tangerines: 2.00@2.50 per small box.

GRAIN

Sales on Grain Exchange:
Barley: Feed, 1.22 1/2@1.27 1/2.
Wheat: Mill, 1.85@1.95, feed, 1.85@1.95.
Red Feed Oats: 1.40@1.55; seed, 1.75@2.10.
Corn: California yellow, 1.40@1.45; eastern yellow, No. 2, 1.37@1.40; No. 3, 1.25@1.27; No. 3 Kafir, in bulk, 1.43@1.45; white Egyptian, 1.72 1/2@1.77 1/2; California red milo, 1.45@1.47 1/2.

Citrus Markets

Los Angeles, January 18, 1922.

Reaction from the brisk holiday trade and overloading of markets with Florida and Porto Rico fruit shows in slow demand and dropping of prices for California. Slowing down of market has naturally slowed down shipments of oranges so that this week's shipments are light. The Exchange will put out its crop estimate about February 1.

The lemon market is inactive. Over 16,000 boxes of foreigns will be available on the market within the next 30 days.

Shipments

Shipments of citrus fruits to date since November 1, 1921. Southern California: Oranges, 3,427 cars; lemons, 1,137; total, 4,564. To same date last season: Oranges, 2,818; lemons, 1,006; total, 3,824. From Central California to date this season: Oranges, 4,073; lemons, 56; total, 4,129. To same date last season: Oranges, 3,390; lemons, 50; total, 3,940. From Northern California to date this season: Oranges, 364; lemons, 6; total, 370. To same date last season: Oranges, 297; lemons, 3; total, 300.

A WORD ABOUT SORGHUMS

(Continued from Page 75.)

ported from feeding grain heads, silage, dry fodder or stover."

Livestock

We are sure the livestock production in California and throughout the Southwest may be greatly increased by an intelligent cultivation of sorghums, making use of the varieties according to their best adaptation to local conditions.

Small herds may be maintained more economically when a better understanding of sorghums is more general and when more silos are built.

EGG LAYING CONTEST

(Continued from Page 85.)

but this will in no way affect the contest records of the birds. All birds above referred to except the highest individual for December are S. C. White Leghorns.

SAVING THE WASTES

Reclamation of over 100,000 acres of land in the Salt River Valley has been brought about through the development work of the Salt River Valley Water Users' Association. Three or four years ago a large expanse of land in the Salt River Valley was considered to have very little value, much of it in fact was worthless on account of the oversaturation of water due to excess irrigation and other reasons. D. W. Murphy of Los Angeles, a consulting engineer formerly associated with the Reclamation Service of the Government, assumed charge of the work of reclaiming the land and under his direction the development has been brought to a successful conclusion. The problem was to eliminate the water and deliver it to other land within the bounds of the project requiring the water.

Since 1918, fifty-two Layne & Bowler Turbine Centrifugal Pumps have been installed in various parts of the project, which are successfully draining the wa-

ter from the oversaturated land. The water produced by these fifty-two pumps, amounting to 60,300 gallons per minute, is delivered through canals and laterals to other parts of the project requiring the water.

The entire project comprises approximately 200,000 acres of land. All of the pumps are of the direct connected type and are operated night and day. Supplementing the fifty-two pumps an additional twenty are now being installed. The land is being devoted to general farming and a considerable portion of it has been placed under cultivation for the raising of cotton.

AGRICULTURAL ENGINEERING PROBLEMS

Practically every community in California has its irrigation or drainage problem, and there are many individual problems. Experience has taught many to realize that expert advice is most satisfactory when thousands of dollars are to be invested in a project that will make or break a community, and the more competent the engineers the better.

Specializing on irrigation and drainage, the Ranch Development Company now offers a field service to any who desire preliminary examinations on irrigation projects and similar engineering problems. Many organizations and members residing in an irrigation district find it economical and most satisfactory to obtain competent, reliable engineers to manage and supervise the surveying, forming of the organization, buying the materials and the actual construction work. Numerous instances are on record where the engineer's skill has saved many times the fee in the purchase of materials and in reducing construction expenses to the minimum. The formation of an irrigation district, the planning and carrying through to completion of irrigation and drainage projects costing thousands of dollars is too important to be entrusted to any but skilled engineers who have proven their ability.

Rules and Regulations for Carrying Out the Provisions of The California Economic Poison Act of 1921

PROCLAMATION BY DIRECTOR OF AGRICULTURE

Proclamation by Director of Agriculture

By virtue of the authority vested in the Director of Agriculture by section 3, California Economic Poison Act of 1921, approved June 3, 1921 (Statutes 1921, Chapter 729), I, G. H. HECKE, Director of Agriculture of the State of California, do hereby proclaim that the following rules and regulations will be in full force and effect on and after the expiration of thirty days from date hereof, and after having been published in one or more newspapers and farm journals of general circulation in the State of California and sent to each person registered in compliance with the provisions of said act:

General

Interference with Agent

1. No person shall interfere with, delay or hinder, or attempt to interfere with, delay or hinder, the taking of samples of economic poisons, making analysis or examination thereof, making investigation concerning the use, sale, adulteration or misbranding of economic poisons by the Director of Agriculture, his agents or authorized representatives.

Inspector

2. Any agent or authorized representative of the State of California Department of Agriculture, or any other person authorized by said department to collect samples of economic poisons, shall be designated as an "inspector."

Collection of Samples

Official Samples

3. Official samples of Economic Poisons shall be those samples only which have been taken by the Director of Agriculture or by an inspector.

Taking Samples

4. Samples of economic poisons may be taken by an inspector from such places, at such times, and in such manner as in the opinion of the Director of Agriculture are necessary for the full enforcement of this act.

Damage to Containers and Contents

5. When it shall be necessary for an inspector to open any container for the purpose of obtaining a sample of economic poison, the inspector shall use reasonable care to avoid damage to said container and the material contained therein, but the State of California Department of Agriculture shall not be liable for unavoidable damage resulting therefrom.

Claim for Value of Samples

6. Any person from whom a sample or samples have been taken by an inspector shall have the right to file a claim against the State of California Department of Agriculture for the value of the sample or samples taken. Said claim shall be made by rendering an invoice of the sample or samples so taken. Said invoice must be rendered in triplicate and filed with said Department within ten days after such sample or samples were taken.

Method of Sampling

7. In the absence of specific directions, the method of sampling of economic poisons shall be that determined upon by the mutual consent of the inspector taking the sample and the person from whom the sample is to be taken, or if the method of sampling cannot be determined in such manner, the inspector shall determine the method of sampling, but the person from whom the sample is being taken shall have the right to file a protest in writing with the Chief of the Division of Agricultural Chemistry of the State of California Department of Agriculture. If such protest is not received within ten days from the date upon which the sample was taken, it shall be assumed that the sample was properly taken.

Methods of Analysis

Methods of Analysis

8. Unless otherwise specified by the Director of Agriculture, the methods employed for the examination or analysis of economic poisons shall be those prescribed by the Chief of the Division of Agricultural Chemistry. In case of dispute the results obtained by following an official or tentative method agreed upon by the Association of Official Agricultural Chemists shall be given the preference, provided there is such a method for the examination or analysis of the material under examination.

Registration

When Application Is Made

9. No person shall be considered as having applied for a certificate of registration unless his application is accompanied by the required registration fee or a sufficient proof of the right to exemption therefrom.

Proof of Exemption from Fee

10. Any person claiming exemption from the payment of the annual registration fee under the provisions of section 12, upon demand of the Director of Agriculture shall furnish such evidence as the Director may require to establish the validity of such claim.

Hearings

Kinds of Hearings

11. Witnesses may be compelled to attend hearings, as provided for in this act, by issue of subpoena, or attendance at a hearing may be voluntary, at the discretion of the Director of Agriculture.

Subpoena of Witnesses

12. In the subpoena of witnesses for attendance at a hearing the procedure shall be followed as provided for in section 353 of the Political Code of California as amended (Chapter 602, Statutes of 1921, p. 1023).

Voluntary Hearings
Adulteration and Misbranding

Reports of Analysis

13. If after examination or analysis a sample appears to be adulterated or misbranded, a report thereof may be given to the person from whom the sample was obtained, or to the person holding license for the manufacture or sale of the material, or to both parties and to such other interested parties as may seem advisable, but such report shall not be published until after ten days from the time the report has been rendered.

Comments or complaints concerning these reports must be made to the Chief of the Division of Agricultural Chemistry within ten days in order to receive consideration.

Evidence of Adulteration or Misbranding

14. When the Chief of the Division of Agricultural Chemistry has obtained sufficient evidence to prove beyond any reasonable doubt that an adulterated or misbranded economic poison has been sold or offered for sale, he shall present the facts to the Director of Agriculture.

Notice of Hearing

15. Upon the Director of Agriculture notifying any person that the person so notified has apparently violated section 2 of the act in regard to adulteration or misbranding, he shall also specify in such notice that such person so notified may request by registered letter a hearing on said matter, the time and place of said hearing to be fixed by the Director of Agriculture.

The person so notified may appear in person or by attorney and may submit oral or written evidence to show any fault or error in the finding of the examiner or analyst.

Serving Notice of Hearings

16. Notices of hearings and findings in regard to adulteration or misbranding may be served in person by any authorized agent of the State of California Department of Agriculture, or by registered mail sent to the last known address of the person to be notified.

At least ten days' notice shall be given prior to the holding of a hearing in regard to adulteration or misbranding.

Voluntary Hearings
Selling Without License or Label

Hearings by Inspector

17. If it appears that an economic poison has been sold or offered for sale without first having been registered as provided for in section 12, or has been sold or offered for sale without being properly labeled as provided for in section 9, a hearing may be held by an inspector at a time and place designated by the inspector.

In these cases, ten days' notice of hearing shall not be required, but the length of time that a notice shall be given prior to the hearing shall be at the discretion of the inspector.

Enforcement

When Enforced

18. With the exceptions noted in Regulations 19 and 20, all the provisions of this act will be enforced on and after the day this regulation becomes effective.

Stocks on Hand

19. A reasonable length of time will be allowed for the disposal of stocks of unregistered economic poisons in the hands of dealers if purchased prior to the time this regulation becomes effective and are not adulterated or misbranded, provided a permit, in writing, authorizing such disposal has been obtained from the Director of Agriculture, or from a person authorized to issue such permit.

Labeling Herbicides and Rodenticides

20. Labeling requirements in respect to substances intended to be used for the control or eradication of weeds and rodents will not be enforced prior to July 1, 1922.

In testimony whereof I have hereunto set my hand and caused the official seal of the Department of Agriculture to be affixed in Sacramento, California, this 29th day of December, 1921.

(Seal)

G. H. HECKE, Director of Agriculture.

We want you to know about

COAST TIRES

The new California product that has gained
a commanding position among the
leading makes in the
United States

**PERFORMANCE IS THE
PROOF OF A TIRE**

and Coast Tires have made good under
every test.

In the last Nevada Road Race
Coast Tires went the entire distance with but one puncture, THE ONLY TIRES THAT EVER went the distance in this gruelling race. Coast Tires made a record run on the Cotati Track of 1,000 miles in 899 minutes without a single stop for tire trouble of any kind.

Coast Tires were used on a test run from San Francisco to New York, making the distance in a trifle over 6 days, and arriving in New York City with the San Francisco air in ALL FOUR TIRES. Coast Tires carried the Essex Car to victory in the dealer's race on the new San Francisco speedway, Sunday, Dec. 11, 1921,

Remember These Facts the Next Time You Buy Tires

Millions of dollars are spent in the East annually by California for tires. This money going out of the State benefits only the Eastern concerns—pays Eastern taxes, gives employment to Eastern workmen.

The Coast Tire and Rubber Company is a California corporation; financed by California capital; employs California labor; pays taxes in California; keeps California money in the State.

and Coast Tires are daily proving their superiority in durability, service, non-skid qualities, on thousands of cars throughout the Coast.

COAST TIRES ARE A SUCCESS because we use only the very highest quality materials, combined with superior design and workmanship. ONE SET will convince you of the truth of our statement that:—

**There Are No Better Tires
Made Anywhere**

Preliminary Estimates California's Crops, 1921

LAST week's Cultivator gave some statements from Mr. Kauffman's report among which were statements in effect that the value of all California crops in 1921 was \$362,690,000 while that of 1920 crops was \$489,110,000, and the great war price production of 1919 was \$561,000,000. We did not then give all the facts available, so give on this page tables worth posting on the wall for future reference.

		—Farm Value, Dec. 1—		BARLEY—							
Production		Unit	Per Unit	Total	1921.....	1920.....	1919.....

REO

SPEED WAGON

Fits Every Farming Need

It's an amazing fact, and a high tribute to Reo experience and Reo engineering, that this Speed Wagon has not only invaded, but conquered, and today absolutely dominates, every field of hauling and carrying and delivering where the goods to be carried are such that they can be moved in units of 500 to 2500 lbs.

Prior to the advent of this Speed Wagon, the work it does today was divided among several widely diversified types and sizes of motor trucks.

By its wonderful adaptability—its versatility—its ability to cover territory—its absolute dependability and surprisingly low up-keep—this pneumatic tired Reo has gone from one kind of service to another and proven it will do any and

all forms of carrying quicker and cheaper. No matter what your work—nor how diversified. Whether in general farming or in highly specialized production.

No matter what your loads—or how greatly they vary.

No matter whether in everyday "chores" or for handling the heavy loads of harvest time.

For live stock or grain or fruit or machinery—passenger or express or freight.

Whether your loads be 500 or 2500 pounds—a quarter-ton or a-ton-and-a-quarter.

Still this Reo Speed Wagon will do your work better and at less cost per ton-mile, per year—or any way you care to figure.

Prices are f. o. b. Lansing, plus Federal Tax

California Cultivator

Vol. LVIII, No. 4

Los Angeles, January 28, 1922

One Dollar Yearly

The Weather Gave Us a Jolt, but We're Still on Top

WHEN Sunday night, January 15, had passed the farmers of California breathed easier. For years there had been a prevalent opinion that when we passed the middle of January we had passed the danger of freezing our crops. This year, however, we are given additional proof of California's versatility, for she has changed the date and given us a jolt with one of our most severe cold spells on January 19 and 20.

Temperatures are reported as low as 15 degrees above zero, and in the citrus sections as low as 20. And even the frostless section where mid-winter spinach, lettuce and other truck crops are grown reports serious injury. In the Imperial Valley matured lettuce is all seriously injured,

By C. B. Messenger

but the younger plants may yet come on with a fair return. Fortunately a large proportion of the regular mid-winter crop of lettuce has been shipped. Cauliflower is less seriously injured, but shipping will be slowed up for a few days. To cabbage the injury is practically nil. Practically all spinach which was not shipped at date of freeze is total loss. Imperial Valley cantaloupes which are already up and not protected will be total loss. The fields protected by the little paper caps are many of them in good condition. Of course all tomatoes and similar tender plants will call for resetting.

Citrus growers have taken hold of the situation with vigor and many

believe they will end the season with a return almost equal to what it would have been if they had shipped the entire crop. Meetings were called in Riverside, Redlands, San Bernardino, Santa Ana and Los Angeles on the third day of the cold spell. Excepting on the part of the few who live in the "frostless belt" the situation was squarely faced that the citrus fruit had been injured, and the question was discussed as to best method of preventing the shipping of injured citrus fruit.

At the Los Angeles meeting Commissioner Ryan stated that he had invited the growers to come together to discuss their own problems and to give instructions to the standardi-

zation officials. He expressed the belief that if care was used in handling the situation uninjured California oranges might yet be shipped to give almost as great return to the growers as if no freeze had occurred. He compared temperatures of cold spells of January 6, 1913, January 1, 1919, and January 20, 1922. The minimum temperatures of these years as gathered by Mr. Ryan are:

	1913	1919	1920
Pasadena	21	23	22
Pomona	21	24	23
Redlands	18	25	20
Riverside	21	22	23
San Bernardino	18	22	22
Santa Ana		22	25
San Fernando		23	22
Los Angeles	28	36	33

In general the larger citrus producing sections show temperatures this (Continued on Page 119.)

Suit Against Raisin Growers Ended

CALIFORNIA cooperators have never given very enthusiastic endorsement to the action of the government in making the packers fight on the raisin industry. However, the cooperators have proved true blue and have even cooperated in this suit which was begun some three years ago. A decision has been rendered and it is to be hoped that it is final. President Wylie M. Giffen says: "It is a matter of congratulation that so satisfactory a conclusion has been reached." President Giffen has issued a statement explaining the various conditions and it will be noted in the text of his statement that excepting for one paragraph, raisin growers have no fault to find.

"This decree was agreed to by the government and ourselves a number of days ago and will be approved as the final decree of the United States

court by the Hon. Benjamin F. Bledsoe, presiding judge of the southern district of California, and that there may be no misunderstanding about its meaning we desire to give the following interpretation of the decree as we understand it:

"Paragraph one provides that the growers' contract, under which we were operating at the time the suit was brought, should not be carried out by us, except as it affect the closing up of our 1920 accounts. This contract had long ago been cancelled by us and we now have an entirely new contract; therefore this paragraph works no hardship.

"Paragraph two provides for the annulment of the contract between ourselves and the California Packing Corporation. That contract automatically ceased when the growers' contract above referred to in paragraph one was cancelled.

Good Will and Success

"Paragraph three provides that no growers' contracts shall be taken by means of coercion, intimidation or

duress. We, of course, agree heartily with this paragraph. We do not believe now and never have believed that an organization built up by such methods could endure. In other words, the very life of an organization like this depends on the good will of the community in which it operates. Whenever this good will is lost to such an extent that the growers will not sign contracts because they believe in the organization we must close our doors. Therefore, this paragraph is not in the least objectionable to us, as we are only enjoined from doing what we have never done.

"Paragraph four provides that we have no right to secure any contract that does not, at the end of the first three years, or at the end of any two year period thereafter, give the right of cancellation to the grower who signed it. This clause was voluntarily put into the contract, under which we are now operating, by us, and of course, a decree which stamps the approval of the government upon it is not only unobjectionable, but is

particularly pleasing. And, so far as the writer is concerned, I believe absolutely in this clause in the contract because, as has just been said, an organization that depends on the contract rather than the good will of the growers is bound to fail, and this clause provides a simple method for growers who become dissatisfied to withdraw and whenever the time comes that the growers of raisins in California believe that as an industry we will be better off without an organization than we are with it, they will naturally exercise this right under this clause and the organization must cease to function as a cooperative institution. This, to me, is unthinkable, and I cannot believe that in the light of past experience the time will ever come when the growers of raisins will exercise this right in such large numbers as to jeopardize the life of the organization, but if in this I am mistaken and it does come I shall accept it as proof that the management is so inefficient that the organization has no place in the (Continued on Page 119.)

University Plans Great Livestock Meeting

THE University of California, through the college of agriculture, and more particularly the animal husbandry division, has announced plans for holding the third "Stockmen's Week" at the university farm, Davis, February 20-25. This event, inaugurated in 1920 for the purpose of carrying the message of better livestock to the producers of this state, has been constantly broadened in scope until at the present time it has become one of the most influential factors in the development of our livestock industry and it has grown in stature until the annual attendance reaches considerably over the thousand mark.

There has never been a time during the past ten years when the various livestock interests of this state needed more to meet together and discuss their individual and combined problems, and for that reason efforts have been made to provide a program calculated to touch all branches and all

phases of the industry. Beef cattle, dairy cattle, hogs, sheep, horses and milk goats all have a place in the activities of the week. Talks and addresses by men of national standing will feature each day's program and cover a range of subjects from production problems to marketing.

Monday, the opening day, will be given over to a meat cutting demonstration in which the relative weights and values of cuts from steer and heifer carcasses will be compared. This will constitute the first demonstration of the kind ever held in the West. During the same afternoon the operation of the cooperative packing plant of the El Dorado County farm bureau will be explained. This will be followed by a discussion of the fresh meat rings developed in Napa County. Under the latter plan it is possible for country folk to have fresh meat every day in the year at a nominal cost.

By R. P. Royce

Tuesday has been designated as "Hereford Day" and will be featured by a meeting of the Pacific Coast Hereford Cattle Breeders' Association. Following this meeting the cattlemen will be addressed by Dean Thos. F. Hunt of the college of agriculture and by Frank S. Hastings, manager of the great 400,000 acre S. M. S. ranch of Texas. Mr. Hastings is one of the most distinguished cattlemen of America. It is also expected that R. J. Kinzer, secretary of the American Cattle Breeders' Association, will be present. During the afternoon the annual spring sale will be held and will include around 80 head of bulls and females. This year an innovation has been introduced in connection with the sale in that the majority of the bulls will be sold in lots rather than as individuals. This departure was made to enable range buyers in need of a carload of bulls

to fill their orders. An evening program has been provided in which Dean Hunt will discuss the European agricultural situation. Dean Hunt recently returned from a year abroad and his observations should prove of great interest. President Barrows of the University will also address the meeting. Mr. Hastings will close the evening program with "Recollections of a Rancher." It was under that title that Mr. Hastings recently published one of the most interesting and delightful contributions to agricultural literature—a book that at once won for him a reputation as a writer quite as high as he enjoyed as a cattleman.

Wednesday is "Shorthorn Day" and promises to be one of the popular days of the week. In the morning session Professor C. E. Howell will make a report of the progress of the U. C. range cattle experiment. The university is now carrying on what is declared to be the most extensive cattle experiment ever attempted in this (Continued on Page 110.)

Agricultural News Notes of the Pacific Coast

Northern California

Santa Rosa is making plans for its rose carnival, May 4-6.

The Lassen County chamber of commerce is planning for a county fair next fall.

The Rice Growers Association is making three and five year contracts with growers.

The Sonoma County farm bureau will hold its annual meeting at Santa Rosa, February 22.

Commercial bodies of Scott Valley, Siskiyou County, are active in work-in for a cow testing association.

The Rice Growers Association of California made its first sale January 11, 20,000 sacks of No. 2 paddy at from \$2.75-\$2.80.

Officers of the Canning Peach Growers are: R. W. Skinner, Yuba City, president; E. R. Williams, San Jose, vice-president.

The California Canning Peach Growers will have its main office at San Francisco with branch offices at Fresno and Yuba City.

Several Sacramento Valley counties were represented at a meeting held at Marysville, January 11, to organize a hog auction sale association.

The farm bureau at Corning, Tehama County, is organizing a cooperative marketing movement among fruit and vegetable growers of that district.

The California Prune and Apricot Growers has opened a San Francisco office at 244 California Street in the Welch Building. The office is in charge of Harless Moser.

Stockmen's Week at university farm, Davis, February 20-25. Cooperative killing and meat packing will be discussed and home cured ham and bacon will be shown in competition.

Officers elected at annual meeting Placer County farm bureau: John A. Livingston, Auburn, president; Henry W. Ahart, Lincoln, vice-president; Maud Elkers, Auburn, secretary-treasurer; J. A. Teagarden, Auburn, state director.

Owing to the increased number of corn fed hogs being received at the Farmers' Exchange packing plant at El Dorado, Placer County, a number of new salting vats are being made and other enlargements are under way to properly care for the growing business of curing meats.

California's fruit pack for 1921 totals 8,511,851 cases all grades and sizes, compared with 11,382,863 cases in 1920 and 13,696,403 in 1919. About 1,679,330 cases were packed this year in Southern California as well as 46,824 cases of vegetables. State vegetable pack for 1921 is 2,615,947 cases, compared to 5,249,946 in 1920 and 7,051,519 in 1919. Stocks in canners' and jobbers' hands lighter than for many years.

At the recent annual meeting of the Fruit Growers of California the entire board of directors was reelected: R. P. Van Orden, Mountain View; I. O. Rhoades, Morgan Hill; H. N. Schroeder, Los Altos; W. E. Moore, Berryessa; E. K. Clendenning, Campbell; R. V. Garrod, Saratoga; L. E. Walter, Mountain View; H. L. Coates, Evergreen; H. A. Clark, Saratoga; W. L. Dunlap, Hollister; W. A. Johnson, Hollister; James Milne, Morgan Hill; E. B. Sellers, Oakley.

Central California

Engineers estimate cost of the Pine Flat project at \$20,000,000.

Tulake "lake" is filling up and much planted grain land has been flooded.

Nine hundred cows were tested by the Stanislaus County farm bureau during December.

The Stanislaus County Holstein Breeders' Association held a meeting and banquet at Modesto last week.

A meeting in the interest of cow testing was held at Riverdale, Fresno County, January 17. 150 dairymen attended.

It is planned to have representatives from civic bodies of every city in the San Joaquin Valley to form a permanent Raisin Day Festival Association.

The new name of the raisin growers association, Sun-Maid Raisin Growers, will soon be in use, technicalities having been practically all complied with.

Stanislaus County poultrymen who ship through the Northern California Egg Producers Association will soon have an up-to-date shipping station at Modesto.

Joint installation of the officers of the granges of Tulare, Visalia, Dinuba and Poplar, as well as the Tulare County Pomona Grange, was held at Tulare, January 11.

A two days institute for vineyardists was held at Fresno, January 26 and 27. The program was under direction of Fred K. Howard, chief of the growers service department of the Sun-Maid Growers.

The Monterey Tree Growing Club recently presented the state highway commission with 1,000 oak trees of several varieties. This club primarily is interested in use of trees as soldiers' memorials.

Sixty melon growers of Turlock have formed a marketing association. Directors selected are: H. A. Stammerjohan, Dr. Berry, W. Reedy, W. A. Mason, Harry Alexander, A. C. Rapp and M. L. Pope.

Applications for grazing permits in the Sequoia national forest will be received by the forest supervisor at Porterville up to February 1. 29,870 head of cattle and horses will be allowed, 6000 sheep and 600 swine.

The Farmers Mutual Fire Insurance Company of Stanislaus County held its annual meeting at Turlock January 9. W. M. Way of Modesto was elected president; Peter Erickson, vice-president. The new directors are: A. L. Rutherford, W. H. Brink, Charles Higbee, G. R. Larson and Claus Johnson.

The California Grape Growers' Exchange at its annual meeting January 10 elected directors to represent grape growing districts: E. G. Smith, Geyserville; H. J. Klein, Napa; Frank T. Swett, Martinez; Eugene Frye, Elk Grove; C. L. Crawford, Ukiah; E. M. Sheehan, San Francisco; E. M. Bowles, San Francisco, representing state market commission.

The Tulare County Cattlemen's Association at its annual meeting last week elected W. J. Fulgham of Visalia president and selected other officers as follows: Vice President, Walter Goins, of Visalia; secretary, C. A. Guthrie, of White River; directors, W. J. Fulgham, C. A. Guthrie, Walter Goins, E. B. Armstrong of Earlimart, and J. G. Brown of Porterville.

Southern California

Imperial Valley vegetable growers are finding profit from asparagus.

February 6-10 has been designated "Honey Week" by Governor Stephens.

A second walnut packing house is to be built at Garden Grove, Orange County.

Anaheim, Orange County, reports a seven foot raise in water level since the storm.

Pure bred livestock breeders will hold their next meeting at Riverside, April 8, Dairy Day.

The farm bureau of Imperial County is distributing cuttings of tamarisk trees for windbreaks.

Ranchers in the Perris Valley say the water table has already risen four to six feet since the big rains.

A branch office and warehouse of the California Prune & Apricot Growers has been opened in Los Angeles.

Farmers in the vicinity of Neighbors, Palo Verde Valley, will form a unit of the Riverside County farm bureau.

Eighty ranchers enrolled in the tractor course given at Covina last week by experts from the state university.

Apple growing sections of Southern California are trying to get together in a cooperative marketing organization.

Decreased shipments of lettuce from Imperial Valley have sent up prices at shipping points. Carlots were bringing last week \$1.85.

Property owners at Anaheim are subscribing to the fund for banding of permanent levees along the Santa Ana River east of the city of Anaheim.

A meeting of apple and pear growers of Southern California will be called at Yucaipa sometime in February. The object is to discuss plans for a marketing organization.

Horticultural Commissioner Waite of Imperial County has placed at the county line of all highways large signs warning truck drivers that all plants must be inspected before delivery.

The management of the National Orange Show to be held at San Bernardino, February 17-27, has banned sale on the grounds of synthetic fruit drinks. Nothing but pure fruit juices may be offered.

Horticultural Commissioner Waite of Imperial County is answering questions from many grape planters to the effect that all grape cuttings brought in from the San Joaquin Valley must be given hot water treatment.

The Associated Chambers of Commerce of Orange County recommends that an association of growers be formed for the purpose of taking immediate steps toward flood control in this county, with the probability that it will be merged into the larger organization when the tri-counties system begins to function.

The Town Dwelling Mutual Insurance Company, the major part of whose business is in insurance of farm homes and buildings in Los Angeles County, reelected at its second annual meeting C. B. Messenger, president; Carlyle Thorpe, vice-president, and Fred Cromer, secretary-treasurer. This company, not yet two years old, is carrying \$1,207,000 and has a very neat reserve fund.

The Coast and General

A number of Arizona cotton fields will not be picked owing to low prices.

A district sales office of the Sun-Maid Growers is being opened in Vancouver.

Meet of the North Pacific Fair Association at Spokane, Washington, February 2-3.

Washington's mid-winter poultry show at Seattle brought out more than 1000 exhibits.

Berry growers of Cowlitz County, Washington, have formed a cooperative marketing association.

Clarke County, Washington, last season put out 8180 bushels of certified seed potatoes, mostly Burbanks.

Potato growers on reservation lands at Yakima, Washington, have lost heavily from injury caused by wireworms.

Oregon's fruit pack last year was 1,304,457 cases; vegetable, 53,745. Washington fruit, 1,307,548; vegetable, 103,665.

Bills have been introduced into both senate and house to place the forest service under the department of agriculture.

General Goethals, builder of the Panama Canal, has been secured by the state of Oregon to make survey of the Columbia River basin project.

Sale of a million pounds of scoured wool is reported from Oregon at 70 to 80 cents a pound; another sale of a million pounds at 21½ to 30¼ cents per grease pound.

Figures to prove that 50 apple trees to the acre will produce more fruit than 85-100 trees are being collected by Professor O. M. Morris of Washington state college.

The twentieth annual convention of the Washington Wool Growers' Association was held in Yakima, January 13 and 14. A growers' finance association was formed to take advantage of federal loan funds.

The National Cannery Association held its annual meeting at Louisville, Kentucky, January 16. The Canning Machinery & Supplies Association and the National Food Brokers Association held their annuals in connection with the canners.

An unusually large quantity of grapefruit and oranges intended for local consumption remains on the trees in the Salt River Valley of Arizona and its quality has been greatly improved by the cool weather that has not been cold enough to damage the fruit.

Salt River Valley of Arizona reports: "Cold nights have continued and have been favorable for lettuce, the quality of which continues to be excellent. The absence of decidedly cold weather has encouraged the early planting of potatoes and the preparation of the soil and seeding for a larger crop than usual is in progress."

On protest of the Western Nut Growers' Association and by proclamation of Governor Olcott of Oregon, silver gray squirrels are to be banished from the capitol grounds at Salem. They are regarded by nut growers as too serious a pest to warrant their propagation under state authority, some asserting that squirrels take at least half of the nuts that mature.

EVERY few days at this season of the year one hears talk of a new system of pruning this or that variety of grapes, and at the present time there are so many systems advocated that it is confusing to a grower who wishes to practice the very best methods in his vineyard. Usually these so-called pruning systems are applicable only under the particular conditions under which they originated and, for the best success, should not be used under any and all conditions. Someone has said that pruning contributes more than any other single operation to the production of a good crop of grapes. This may or may not be literally true, but certainly many growers have learned by experience that pruning has a great deal to do with the success of their vineyards, where other conditions are at least conducive to the production of a normal crop. It has long been recognized that each vine must be treated as an individual, that is, it is not considered wise to lay down any definite rule for the amount of fruit wood to leave on vines. It has been the practice in the past for the owner to instruct his crew to leave a definite number of spurs on every vine, or in case of long pruned varieties, to leave four canes or six canes, depending on what he considered the proper amount.

The vigor of vines varies to such an extent that this practice is gradually changing to one which allows the pruner to use his judgment in the pruning of each vine. One vine may be vigorous enough to support more fruit spurs or canes than its neighbor and it has been found that this close attention to the individual characteristics of vines has had much to do with improving not only the quantity but the quality of fruit produced.

Every grower should carefully study the various methods of pruning and the different systems which are being advocated at the present time, attempting to pick out those parts of the method which seem to be best suited to his particular conditions. If

he is in a district subject to spring frost he would be wise in choosing a system which would keep most of his fruit growth as high as possible. Extremely windy locations would require another system, soil which produces excessive wood growth would require some modification of most systems. Table grape varieties must be so trained that the fruit will not come in contact with the soil. In some cases colored varieties must be pruned in such a way that the fruit is more or less exposed to the sun, promoting earlier and better coloring. Exactly the opposite treatment may be required on those same varieties in other districts.

Pruning, therefore, is really a very complicated matter and a subject which should be thoroughly studied by each grower to help him decide how best to handle his own vines, and when he has decided on the ideal type which will give him the best results he should stick to that system until it has been well demonstrated that some change in it will return a greater net profit per acre. It is unwise to attempt to follow one system one year, another system the next and so on.

Time of Pruning

Much has been said regarding the proper time to prune grapes. The accepted idea is that late pruning tends to prevent early growth and therefore lessens the danger from frost injury. This idea is so firmly in the minds of growers that very often pruning is left until very late in the season and requires on large places very large crews of pruners to get the job done before plowing must start. It is only the injury from very light frosts that can be prevented in this way. Extremely heavy frosts, such as were experienced throughout the San Joa-

quin Valley last season, would do as much damage on the late pruned vines as on the early pruned ones, consequently it would seem the part of wisdom, particularly in those districts where frosts are not usual, to start pruning earlier in the year with a smaller crew which could be given more careful supervision. The amount of fruit wood to be left on each vine, as we have stated before, depends on the vigor of the vine, bearing in mind always that the vine has two duties to perform during the season, first, the setting and maturing of a profitable crop of fruit, second, growing and maturing sufficient strong fruit wood to provide for good canes and well developed fruit buds for next year's production. Pruners should always have these two things in mind and regulate the amount of wood on each vine to conform to these principles.

Some varieties, such as the Thompsons and Sultanas, require the leaving of canes rather than spurs. This is due to the fact that the buds at the base of the canes are not as fruitful in these varieties as they are in the so-called short pruned varieties like the Muscat, Malaga, Cornichon, etc. In pruning as many canes are left as the vigor of the vine will justify, and these canes should be tied to a wire trellis, thus distributing the fruit and also distributing the prospective leaf surface that it may be well exposed to sunlight. The old system of tying canes to the stake has largely been discarded because of the practical impossibility of encouraging a new cane growth from the head of the vine where it is most desired, because of shading out. With the canes on trellises the crown or head of the vine is left more or less exposed and buds on the renewal spurs which are left for the purpose of growing strong

fruiting wood for the following year are given a chance to develop. The tendency is toward higher heads for all varieties than in the past. This tendency has been brought about by two factors: the first being that older vineyards with low heads and several trunks reaching up to a point approximately at the lower wire of the trellis have been found to gradually weaken after a few years of production to such an extent that drastic measures were necessary to get them in producing shape again. The present method of allowing a single trunk and high head when properly cared for, removes that serious objection. The second reason for the change has been that there is a general tendency toward more horse and power cultivation. The low spreading heads prevented plows or other implements from loosening the soil close to the vine, making it necessary for the vineyardist to resort to the use of shovels. This work is expensive and rather hard on the back.

Varieties which are usually pruned to spurs tend to spread so rapidly that the arms of the vine soon reach out to such a length that they are easily snagged off by implements and in time, unless the wood is very vigorous, reach a point where they are incapable of carrying the proper amount of fruit. This tendency can be overcome by pruners in a few years' time by rather severely pruning and leaving short spurs which may grow from points along the arm near the head. When buds from these spurs have grown to strong canes the whole arm may be shortened back to that spur. Consistent and careful attention to this matter has improved and increased the producing ability of a great many vineyards during the past few years.

It is just as important to make clean cuts which will heal over rapidly in vineyards as it is when pruning fruit trees, and the use of paint for covering large wounds should not be neglected if the grower wishes to keep his vineyard in the highest producing state.

The Irrigation of Oranges on the West Side of the Sacramento River

MORE and more orange growers from Southern California are coming to Northern California to investigate the orange growing on the floor of the valley and on the foothills on the western side. They all marvel at the growth the orange tree makes here; at the abundance of organic matter available; at the freedom from pests; but the abundance of irrigation water and the cost of the same seems to appeal to them more than any other factor entering into the production of the citrus. Many problems have arisen in connection with the irrigation of citrus in the North, however, due to the abundant supply and low cost of the water, and these problems are the only ones necessary for the successful grower of citrus to solve in the north insofar as irrigation is concerned.

Water is obtained from three sources:

From the Sacramento River, through the Glenn Colusa irrigation canal, from which it is delivered to the growers' pumping plants at \$4.50 per acre per year. Quantity unlimited.

From wells ranging in depth from 100 to 200 feet, from which water is delivered by electric pumps at an expense of from \$5 to \$7.50 per acre per year. There is an abundance of under-

ground water, 12 inch wells in almost every case delivering very close to 2,000 gallons per minute.

From the United States reclamation district canal system, fed by the

owners at a cost of \$4.20 per acre (last year) including the construction, operation and maintenance charges.

From the above you will note that there is an almost unlimited supply of

hills above the Glenn Colusa canal is pumped at a cost running from \$5 to \$15 per acre.

Up to the present the low cost of the water has been in most cases very detrimental to the citrus industry. The growers have in many cases endeavored to decrease the amount of cultivation and increase the water, with the result that on some of the heavier soil areas they have more or less waterlogged their soil, kept it in a very cold, dormant condition, and have retarded the growth of the trees. This is particularly true of the trees grown on the more retentive red soils of the Tehama-Corning series. In other localities where the trees are situated in the loose, open and well drained soils of the Elder series, too much water has been applied and it has kept the soil cold and has caused considerable leaching. At the present time, however, in almost every case the farmers have learned their lesson and a very careful system of irrigation is being practiced.

On the 800 acre orchards west of Maxwell, operated by the Mills Orchards Corporation, the water is put through booster pumps to elevations reaching as high as 275 feet, and from there it is distributed over the planting, through concrete pipes, the distri-

(Continued on Page 99.)

Irrigation System in Lemon Orchard of James Mills Orchards Corporation at Maxwell.

water impounded behind the large dam situated in the mountains behind Orland and on a branch of Stony Creek. This dam impounds a maximum of slightly better than 20,000 acre feet and delivers it to the land

water. This water is of splendid quality, running considerably less than 200 parts alkali to the 100,000 parts water. Best of all, it is available at all times, in any amount, and at very reasonable cost. Water delivered to the foot-

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

If among the more than 40,000 Cultivator's weekly circulation any fail to find any article they desire to purchase advertised in the Cultivator's columns, a special request is extended to you to let your wants be known to the California Cultivator and we will place you in touch with proper parties.

EDITORIALETES

Kaufman of the California Cooperative Crop Reporting Service gives some enlightening figures on the cover. It will be observed there are some very satisfactory figures in the total production column, but some very unsatisfactory ones in the farm value column. Note that wheat, rice, hops, cotton and cotton seed, and many other staple products bring to the farmer only from one-half to one-seventh of the values of 1919. These figures are influenced largely by the reconstruction which we hope is being effected, but if there is any other interest which is bearing such a proportion of the burden of reconstruction as the producing interests we are unable to find it.

We have a 245 word night letter from a Chicago manufacturer and importer in which is given copy of a telegram to all senators and representatives with appeal "to you to throw your influence against the bill of such vicious consequences. We favor a tariff, but not the crippling, smothering, impossible tariff of the Fordney bill." Sure, protect me but

let the other fellow, especially the farmer, bear the burden.

Humboldt County wins again. Peter Iversen of Grizzly Bluff wins the California Cultivator prize for five grade cows producing the largest amount of butter fat during the month of December of any five grade cows in the state of California.

* * *

Don't forget some of the lessons of the 1913 and 1919 freezes. The orchardist thoroughly equipped with frost fighting appliances covered the overhead and made many years' interest on his investment. Some frost fighters maintained a successful fight excepting for the last hour or two of the long night, and love's labor was lost because of one hour failure. Don't prune back too quickly. Many lemon trees were seriously injured by too severe pruning. Our desire to save the reputation of our own "frostless section" induced many to remove proofs of injury, but every possible leaf should be preserved during the reconstruction period. Don't paint over trunks of small trees with mineral oil. If young trees have been severely cut back do not fertilize. As soon as definitely determined that fruit is injured remove and plow under.

Arnold H. Kruckman, secretary of the League of the Southwest, is at Washington attending the sessions of the Colorado River Commission which is presided over by Herbert Hoover. May the deliberations of the commission be characterized by thoroughgoing cooperative spirit, common sense and integrity and may the slogan be "Do it quick."

SAVE THE QUARANTINE

Insects and fungous pests which have been introduced to this country from other lands are levying a tribute of hundreds of millions annually on American agriculture. We awakened all too late and established state and later federal quarantines. State quarantine has so thoroughly shown its worth to fruit growing and agricultural interests that it will probably increase in efficiency and secure the fullest support of the people.

The federal quarantine, however, has been forced to fight more strenuously for its existence. Especially is this the case at this moment because of the cry for greater economy, and the department of agriculture is compelled to economize with all other departments. The pine blister rust which was introduced to this country because of lack of quarantine is so seriously threatening the lumber industry that the suggestion has been made that the all too small fund heretofore devoted to quarantine be used

in endeavor to control the advance of pine blister rust. This looks like locking the door after the horse is stolen and unlocking all other doors. Producers of the country must keep their eyes open and demand an increase rather than decrease of our effective federal quarantine.

AGRICULTURAL BLOC

The agricultural bloc has proved a serious stumbling block to interests which have heretofore had a less obstructed path to the gaining of their own ends. Further, the bloc has been affixed to the end of a big stick and wielded with vigorous arm so as to render a few sledge hammer blows to selfish measures in genuine Rooseveltian style. This is being seriously objected to. It is claimed the like never occurred before and it must be stopped. As a matter of fact the farmers are only doing and accomplishing what other interests have accomplished from time immemorial. The other interests have, however, been somewhat smoother in their methods and their work has not been so outstanding as that of one class. The farmers are now securing a measure of justice. We, say "a measure," for note that the truth in fabrics bill, Capper-Volstead bill granting to agricultural interests privilege of cooperation, and other measures of relief to livestock and farming interests still on the ways with bitterest opposition by manufacturers, importers and others. In other words, the manufacturers bloc, the importers bloc and numerous other blocs are seriously blocking wise and just legislation. The president feels hurt that one "dirt farmer" is desired on the federal reserve board. Perhaps the "dirt farmer" should not presume to advise in matters which are of vital concern to him and to his fellowmen, but it appeals to us that this request is entirely proper.

In any case, the work laid out for the bloc has not been entirely accomplished. We hope the farmers will continue to stand for their rights.

THE MONKEY WRENCH

For about the first time in the history of the world the farmer is getting some real lively attention. He has been the "horny handed son of toil," "the balance wheel of the Republic," "the stand-by of the nation" and several other pretty things, especially at election time, but after election was over has been permitted to be cuffed from left to right and exploited at all seasons. But now he has the bankers and manufacturers and the big interests getting real mad at him and saying quite uncomplicated things.

The farmer has a bloc and is using it effectively; consequently he is using the legislative methods of the corrupt classes. The business interests deny that they object to the farmer's methods because they come from the farmer, but because of "grave evil of factors or factions constituted on class lines which will menace the Republic."

A committee of American business men in New York is circulating a letter written by Otto H. Kahn. Mr. Kahn gave some sledge hammer blows for the freedom of the world at a time when the country of which he was a native was making attack even upon civilization. As an adopted American he was at that time entirely correct and doubtless secured for this country the support of a vast number of people who otherwise

might have been German sympathizers. At the present time he is endeavoring to secure the termination of the agricultural bloc. Amongst other things in his letter he says:

"Granted that it be true that business in the past has not been sufficiently considerate of, and interested in, the needs of agriculture, is that any reason why agriculture should now take the same regrettable and harmful attitude toward business? While 'turn about is fair play,' it is by no means always the wisest and most effective play. In the present stage of this nation's and the world's affairs, it is a kind of play which can be indulged in only to the grave detriment of all concerned."

All of which may be true, but why has it taken the big business interests so long to hear the appeal for justice? No respectful hearing was ever secured until the farmer took his club and pounded vigorously. Mr. Kahn closes with:

"So far from counselling an attitude of antagonism toward the farmers and their representatives, I would advise that your committee endeavor to get into touch with the leading farm organizations and representatives of agriculture, with a view to establishing opportunities for comparisons of views, leading, it may be hoped, to an endeavor to agree upon wise and effective lines of policy and action so as to promote the essential and legitimate interests of agriculture in the only way in which they can be promoted lastingly."

Very good, but here's hoping the agricultural bloc stands pat until some long needed reforms are secured.

THE CONFERENCE

The National Agricultural Conference called by President Harding began its sessions last Monday morning. The invitation of the president and Secretary Wallace resulted in nearly 300 delegates consisting of "dirt" farmers and others. Amongst the others were bankers, manufacturers, transportation people, in fact, all the greater industries of the country were represented. The question has been asked, "Why this keen interest on the part of those not agriculturists, and by some the feeling has been expressed that the farmer is abundantly able to solve his own problem if allowed a free hand without the interference of large commercial interests."

But we believe in this case that if selfishness brought the other interests into this agricultural conference that selfishness was more or less enlightened and able to appreciate the fact that the welfare of the nation is guaranteed by the welfare of agriculture. We hope the large interests which are watching these movements looking toward justice to the farmer will not endeavor to do as congress has done and raise the cry of "class favoritism."

In opening the conference President Harding said: "There should be developed a thorough code of law and business procedure, with the proper machinery of finance through some agency to insure that turnover capital shall be as generously supplied to the farmer and on as reasonable terms as to other industries. An industry, more vital than any other, in which nearly half the nation's wealth is invested, can be relied upon for good security and certain returns."

Later he added: "The selling price must be higher and the consumer's buying price must be lower."

The press dispatches announce: "Applause broke forth when the president made a slight digression to assert that present conditions in the agricultural industry 'are truly of na-

tional interest and not entitled to be regarded as primarily the concern of either a class or a section, or a bloc."

Committees have been appointed which will report during the last three days of the conference. Chairmen appointed are: Agricultural price relations—E. B. Cornwall, Vermont. Agricultural credit and insurance—S. F. Houston, Missouri. Transportation—H. J. Waters, Missouri. Foreign competition and demands—H. J. Sconce, Illinois. Cost, prices and readjustments—H. L. Russell, Wisconsin. Crop and market statistics—C. S. Barrett, Georgia. Marketing of farm products—G. H. Powell, California. Agricultural research and education—O. E. Bradfute, Ohio. National forest policy—Gifford Pinchot, Pennsylvania. National land policies—R. A. Pierson, Iowa. Farm population and farm homes—S. J. Lowell, New York. Coordination of state and federal legislation—E. S. Brigham, Vermont.

There is fear on part of some farmers that the purpose of the conference is to destroy the "Agricultural Bloc." One delegate from South Carolina said: "About all the farmers and farm leaders have to do is to shake hands with the president, meet some official dignitaries, partake of a little ice cream and cake and then go home."

The hope is general, however, that it is not a shrewd political move but an honest to goodness effort to benefit the country.

FARMERS' PROBLEMS

One of the largest banks on the Pacific Coast issues a monthly financial letter. The last one, bearing date of January 14, contains this statement: "Our Federal Farm Loan Banks are a glaring example of class legislation. For every dollar saved the borrower from these banks in interest the taxpayers of the country pay twelve dollars. When it comes to collecting

the loans made by these banks they will find themselves the owners of, and loaded down with, the finest assortment of worthless assets which ever came to the hands of an improvident lender."

It is very fortunate that the extremists of the ultra-capitalist class on one side and of the Bolshevik on the other are represented by an extremely small minority. A more representative view and, in this case, also an expression of

This being the case of an industry that contributes, in the raw material form alone, about one-third of the national annual wealth production and is the means of livelihood of about 49 per cent of the population, it is obvious that the subject is one of grave concern. Not only do the farmers make up one-half of the nation, but the well being of the other half depends upon them.

"So long as we have nations, a wise political economy will aim at a large degree of national self-sufficiency and self-containment. Rome fell when the

change and new deals. Because a thing always has been so no longer means that it is righteous, or always shall be so. More, perhaps, than ever before there is a widespread feeling that all human relations can be improved by taking thought, and that it is not becoming for the reasoning animal to leave his destiny largely to chance and natural incidence.

"Agriculture is the greatest and fundamentally the most important of our American industries. The cities are but the branches of the tree of national life, the roots of which go deeply into the land. We all flourish or decline with the farmer. So, when we of the cities read of the present universal distress of the farmers, of a slump of six billion dollars in the farm value of their crops in a single year, of their inability to meet mortgages or to pay current bills, and how, seeking relief from their ills, they are planning to form pools, inaugurate farmers' strikes, and demand legislation abolishing grain exchanges, private cattle markets, and the like, we ought not hastily to brand them as economic heretics and highwaymen and hurl at them the charge of being seekers of special privilege."

Yet some there be who are not even enlightened in their selfishness.

CHERRY GROWERS

The California Cherry Growers Association at a conference held this week in the office of the division of markets elected directors and officers for the coming season and planned an intensive drive for new members. The drive is now actively under way with officers of the association at work in Alameda and San Joaquin Counties.

The following directors by counties were named: Sonoma, L. A. Frei, F. W. Maddocks; Napa, L. F. Coombs; San Joaquin, A. B. Haslacher, C. Searle; Alameda, C. Long, Jr. The new officers are F. W. Maddocks, president; A. B. Haslacher, vice-president, and C. Long, Jr., secretary.

An ordinance to prohibit use of more than four acre feet of water per year is being considered by supervisors of Glenn County. Injury from seepage of rice lands has made some regulation imperative.

CALIFORNIA'S REPUTATION AND EASTERN CONSUMERS PROTECTED THROUGH STANDARDIZATION

California's fruit growers have always been jealous of the reputation of their fruit, and to the end that the reputation for high grade fruit might be upheld, they have fully supported the state department of agriculture in the enforcement of the standardization act. We have reported the action of citrus growers taken in practically all the citrus centers last Saturday afternoon. As we go to press horticultural commissioners and standardization officials from practically all citrus sections are in conference discussing the injured fruit situation. This conference was called by F. W. Read, in charge of the bureau of standardization, and after wire conference with Director Hecke now in Washington. Instructions have been given to all shippers and transportation companies that no fruit whatever is to be shipped without permit from standardization officials. This power is given to the department of agriculture by the fruit standardization act.

one of the country's greatest bankers, Bernard M. Baruch of New York, is:

"The whole rural world is in a ferment of unrest, and there is an unparalleled volume and intensity of determined, if not angry, protest; and an ominous swarming of occupational conferences, interest groupings, political movements and propaganda. Such a turmoil cannot but arrest our attention. Indeed, it demands our careful study and examination. It is not likely that six million aloof and ruggedly independent men have come together and banded themselves into active unions, societies, farm bureaus, and so forth, for no sufficient cause.

"Investigation of the subject conclusively proves that, while there is much overstatement of grievances and misconception of remedies, the farmers are right in complaining of wrongs long endured, and right in holding that it is feasible to relieve their ills with benefit to the rest of the community.

food supply was too far removed from the belly.

"They are truly common problems, and there should be no attempt to deal with them as if they were purely the selfish demands of a clear-cut group, antagonistic to the rest of the community. Rather should we consider agriculture in the light of broad national policy, just as we consider oil, coal, steel, dyestuffs, and so forth, as sinews of national strength. Our growing population and a higher standard of living demand increasing food supplies, and more wool, cotton, hides and the rest. With the disappearance of free or cheap fertile land, additional acreage and increased yields can come only from costly effort. This we need not expect from an impoverished or unhappy rural population.

"It will not do to take a narrow view of the rural discontent, or to appraise it from the standpoint of yesterday. This is peculiarly an age of flux and

Grow Raisin, Wine and Table Grapes

On this New Sub-Division—only 6 Hours by Auto from Los Angeles—In the Heart of California Raisin District.

VALLEY IRRIGATED FARMS

Surrounded by schools, markets, towns, good roads and Boulevards. Between two transcontinental Railway lines. No "Pioneering" to do—you live in comfort with all modern conveniences, where neighboring Vineyards are getting an average of

4½ Tons Per Acre Selling at \$250 Ton on Average

WATER RIGHTS A PERMANENT PART OF YOUR LAND! Not in a "Bonded Irrigation District" so your water rights are NOT assessable—and the extremely low water lift on Valley Irrigated Farms provides MORE WATER THAN YOU CAN POSSIBLY USE at the extremely low cost of \$7.50 to \$10 acre!

Only \$250 an Acre—25% Down—No Further Payment for 5 Years

Those of you who have read Fred K. Howard's series of articles on Selecting, Planting and caring for vineyards as they appeared in this publication are familiar with the real profit possibilities of grape growing.

THE U. S. CENSUS FIGURES show that in 1920 there were 180,000 tons of Raisin grapes grown in California with a value of NINETY TWO MILLION FIVE HUNDRED THOUSAND DOLLARS—or \$310 per Ton.

Many owners of Vineyards in this District are having them planted and cultivated practically FREE of COST by leasing to truck growers who plant between the vines. ASK US ABOUT THIS!

Statement of California Associated Raisin Co.—Dec. 1921.

Variety	Price Paid per Ton
Muscats	\$233.05
Thompsons	295.45
Sultanas	242.65
Bleached Thompsons	277.60
AVERAGE PRICE PAID	\$259.68

One man in this District (name on request) planted 80 acres to vines last spring and sold in the fall for \$65,000.00. He also sold a 160 acre piece for \$88,000.00.

Another man with 11 acres of 2 year old vines this year received a check for \$9,640.00 for his crop. Do you know any other equally profitable investment?

No Worry About Markets

The raisin grower has no worry about market conditions or prices. The Growers Associations have stabilized prices and they attend to all details of selling the crop.

Free Trip of Inspection

No matter where you live in California we will arrange a FREE trip of inspection to this property. But because we have a limited acreage we must ask you to Write or WIRE at our expense IMMEDIATELY.

There will probably never be a better time to invest for speculation or for actually planting a vineyard. Use the coupon or WIRE us today.

Because proper grape land with good water supply is eagerly sought in this district we have been able to secure but limited acreage to sell at this low price of \$250 acre. So we can accommodate but a few families with these desirable vineyard properties. We urge you to make arrangements to inspect this land AT ONCE. Don't delay.

Fill out and mail this coupon IMMEDIATELY.

Grape Pruning Demonstrations

By Ernest Brauntton

PROF. F. T. BIOLETTI, head of the division of viticulture, state college of agriculture, has been touring the state in a series of lectures and field demonstrations on pruning and trellising. While some of his remarks on trellising would apply quite generally to grapes, he usually confined his talks rather closely to the variety being handled. One of these was the Emperor.

"The Emperor is an extremely vigorous vine bearing large bunches of large grapes and needs the heaviest soil of all sorts grown. The best practice consists of growing the vines on stakes six to eight feet high, a single trunk with short arms beginning about a foot above the soil, leaving five or six buds on each spur. Short pruning will prevent cropping freely; vines must be long pruned. The longer the trunk the shorter the spurs may be.

"This method proves to be good practice for a few years, but it was observed that the strongest growth was always on top and that growths below were more feeble and cropped but lightly. For the past few years we have been practicing the cordon method and find it better. We train the trunk up to a wire 30 inches above the ground and along this to the next vine, no matter what the distance. The next year another wire 12 inches higher is put on posts and laterals trained to this. Except for the second or upper wire the vines may get top-heavy and turn upside down. This cordon system gives all parts of the long trunk the same light and chance. This method involves considerable work and expense for the first few years but it pays. Cultivation can be in but one direction. The better distances are for rows seven feet apart and vines in rows 14 feet, growing trunks about 12 feet long.

"In all kinds of pruning we start in same way, doing no special work the first year beyond simply cutting back. Get as much growth the first year as possible as the more leaves grown the larger the root system. The second year throw the entire growth into one cane or cordon. If growth is very strong the full length of trunk may come the first year. Prune away back to roots all canes but one and this one to a stub of two or three buds. From the strongest of these buds will come the trunk, or if all are equal choose the one growing in the direction you wish the trunk to grow. The rows must run in the direction you have to irrigate and trunks either with or against current of water, but have rows run north and south, if possible."

Prof. Bioletti here began setting up a trellis. This vineyard was planted in squares ten by ten feet. At each end of a 60 vine row four by four redwood posts seven feet long were set three feet in the soil, leaning two or three inches "backward" or away from vineyard. Then a midway post was set 30 vines from each end. No more of this size were used and Prof. Bioletti stated posts were at least six inches longer than needed as but 42 inches above soil is needed for wires, the latter being 30 and 42 inches from ground. A two by two inch stake was next driven at every other vine and should be used about every 20 feet, no matter what the planting distance. Then at each remaining vine was placed a stake one inch square, temporary guides on which to train the trunk or cordon, from which trunk should be trained on to wire in as near an abrupt quarter circle as is convenient. These are called pilot stakes and are not permanent as the trunks are self supporting later, the wiring being needed for crop support and to keep rows straight. Special emphasis was laid on having all stakes conform to a straight line so cultivation may be done close to row. Do not cut away lower canes the first year as foliage is needed to start a vigorous vine with extensive root system, but cut away closely when leaves are gone as next year the trunk will have its leaved laterals.

The Malaga

"The Malaga needs an entirely different system of pruning from that given the Emperor, known as head or short pruning. The aim is to leave the proper number of fruit buds or we may get no crops. The secondary aim is to keep proper shape of vine. The best shape or form is a single stem about 15 inches high, with well distributed arms radiating at an upward angle of about 30 degrees. On the ends of these arms are the fruit spurs. The general rule, if vines are in good health, is to leave about the same number of spurs and buds as last year. The vine I am now pruning had eight and we will try to leave eight for this year, of two or three buds each, or about 20 fruit buds. This will give us 20 to 30 bunches of grapes.

"Canes from last year's growth should give us fruit, but canes from old wood may not, so do not leave any of the latter unless needed to complete the required number. Keep all canes on same level if possible so all will get an equal exposure to the sun. If any are shaded they will make poor growth and poor crop. Keep this top in shape of a cup, cutting out central canes and those crossing over the cup-shaped center. Aim to keep head lifted each year and cut away all drooping canes hanging below, but do not encourage spreading or you will have no space for cultivation or harvesting.

Tokay

"The Tokay should be half-long pruned, a little longer than the Malaga, and the vines should be headed higher. It also needs a heavier soil than the Malaga.

Cornichon

"The Cornichon should be high pruned, or trellised, and is no doubt best on the cordon system. If pruned even as short as we pruned the Tokay no crop will result. It must have long spurs of three to five buds. If on wire trellis with long trunk, but two buds to each spur should be left, or, the longer the trunk the shorter the spurs may be, down to two buds on each. Train all head pruned vines to fruit spurs on outside, and if vine needs shaping, to a few renewal or replacing spurs on inside, the latter to keep head from spreading."

Grape Cuttings

Several asked about making and rooting cuttings. Prof. Bioletti said well ripened, heavy wood should be chosen as light weight wood lacks proper substance. Leave cuttings about six buds long and put four buds below and two above the soil. If work is on large scale he would advise first developing calluses by burying cuttings. Cut each just below a bud and tie in bundles of 100, with the butts very evenly placed. Never mind about the tops.

Dig a pit in dry, well drained place, about four to six feet wide and as long as needed, deep enough so when bundles are stood in, butts up, they will be about four inches above soil. Keep all bundles even and level. Shake in dry soil to hold all as firmly as possible, though it is not necessary to have solid filling if it entails too much labor. Then cover over until the butts are four inches under the soil and make all smooth and level, allowing soil to spread to a foot on each side of bundles and have soil mass highest in middle or center so it will shed water. Cover with weeds or straw, or, still better, with a tarpaulin, to keep dry. The best time to plant is March, early March, in sandy soil, later in heavy soil. Three weeks before planting take off canvas or straw cover and water gently with garden sprinkler, until soil is wet down about four inches. Avoid wetting lower, if possible, for we wish the butts, now above, to be warm and moist, while the tops, now below, are cool and dry. At end of three weeks of constant moisture plant all cuttings showing calluses, whether having roots or not; but throw away those showing no callus. A cutting kept dry will retain

CUT DITCHING COST

Prices Slashed No More Shoveling!

No more plows, slips, Fresnoes, or "go-devils." The MARTIN makes the ditch from start to finish, any depth, up to 4 feet. It cleans old weed-grown and silt-filled ditches in jig time.

For Irrigation or Drainage

For small laterals or big ditches; for terracing, rice levees, alfalfa checks and borders and for road building. The MARTIN does the job.

For Horse or Tractor Use

This all-steel, adjustable and reversible implement is made in four sizes. It is sold in every state. Write today for big free catalog.

Wonderful Golden Winesap

You ought to plant some Golden Winesaps this spring. The Golden Winesap has the juicy tartness of the Jonathan, the meatiness of the old Winesap, the beauty of the Winter Banana, the deep gold color of the Grimes and the keeping qualities of the good old Ben Davis. Strong grower, healthy and vigorous. Originated in Utah and should be hardy everywhere. Bears young and very profusely.

True Delicious Apple

This is the ideal farm apple. Large fruit, beautiful dark red, quality unsurpassed. Flavor sweet, slightly touched with acid. Comes out of storage in April in perfect condition.

Jonathan—One of the very best apples we have. Everyone knows its remarkable qualities.

King David—A very productive variety and a good shipper. Medium size, ripens with Jonathan. Should be extensively planted.

Prices of Apple and Peach Trees

Our trees are unusually healthy, well rooted and with good sound bodies. For the quality, these prices are very low.

LOW PRICES—on all kinds of Fruit Trees and Plants, Vegetables, Flower and Field Seeds, Shrubs, etc. Get our big illustrated Catalog sent free.

SONDEREGGER NURSERIES & SEED HOUSE, 91 Court Street, BEATRICE, NEB.

Peaches: Such well known California varieties as the following:
Elberta—Freestone. Hardy and exceedingly productive. Exceptionally large and fine.
Crawford's Early—Freestone. Fruit very large, oblong, yellow with showy red cheeks. A good bearer.

Mayflower Clingstone. Earliest in the market. Good size and fine color—red all over. Strong and thrifty grower. Good shipper and always brings highest price.

J. H. Hale Peach—Perfect freestone. Larger than Elberta. Skin thick and entirely without fuzz. Very hardy, bears young and profusely. One of the best for family and the market.

2 to 3 ft. per 1, 25c per 10, \$2.50 per 100, \$20.00
3 to 4 ft. per 1, 35c per 10, \$3.50 per 100, \$30.00
Other sizes proportionately low.

(40)

vitality for a long time, but after watering starts cuttings should never be allowed to become dry. Asked to pick out a good cutting, Prof. Bioletti chose a vigorous cane of five-eighths diameter and said the basal wood containing six buds was ideal.

THE FIG INSTITUTE

By Cultivator Staff Writer

 OMING as a fitting climax to the Sixth Annual Fig Institute, which incidentally was the best meeting of its kind ever held in the San Joaquin Valley, the fig growers and others interested in cooperative marketing gathered around the banquet table Friday evening, January 19, and enjoyed a feast of roast turkey with trimmings and some of the best talks on cooperative marketing ever heard in the district. The speakers were Wylie M. Giffen, president of the California Associated Raisin Company; Dr. C. M. Haring, director of the agricultural experiment station; Senator M. B. Harris, author of the present California cooperative law and attorney for the California Peach and Fig Growers and the California Associated Raisin Company.

The main talk of the evening was that of G. Harold Powell, general manager of the California Fruit Growers Exchange. Mr. Powell's talk was a rare treat in that he has such an intimate and practical knowledge of his subject and an outstanding ability to present his facts in a clear, logical and understandable manner. While scheduled to speak on the fundamental principles of cooperation in agriculture, Mr. Powell really dwelt almost exclusively on those points which make cooperative marketing associations economic necessities in food distribution, paying tribute to the California marketing organizations as being the only groups of agricultural producers that have been able to withstand the disastrous season of 1921 when the buying power of consumers in the United States was below par and the population of foreign countries able to make only approximately 30 per cent of normal purchases.

The banquet was held under the auspices of the California Peach and Fig Growers, Inc., and followed a most successful day from the standpoint of attendance and interest in the discussions of the institute.

Declaring that it was only through organization that new products, which would successfully market the fig crop, could be placed on the market and the only medium by which the product could be improved in quality and standardized, J. F. Niswander, vice-president and general manager, California Peach and Fig Growers, opened the institute. Mr. Niswander described in detail the accomplishments of the organization in marketing the fig crop, during the past year, or since fig growers had become associated with the peach company, stating that at the present time only approximately 1000 tons of figs were unsold and less than 800 tons of peaches.

Mr. Niswander also outlined the activities planned by the association for the coming year. The balance of the forenoon was given over to the discussion by growers and others of the problem of shipping fresh figs to Eastern markets. This discussion was very interesting because of the success of this departure in fig marketing methods during the past year.

Following up this discussion, Prof. J. J. Condit, horticulturist for the company, outlined the methods to be employed in pruning fig trees if the fruit was to be used for fresh shipping purposes. He also explained in detail the most successful methods of pruning fig trees of different varieties and ages.

Always interesting and instructive and usually found at gatherings of fig growers, Dr. G. P. Rixford of the United States department of agriculture and the grandfather of the fig industry in California, told of the methods of propagating and pollinating figs used by the Armenians of Smyrna and went into detail regarding diseases and pests affecting figs in the Southern states, sounding a note of warning to fig growers regarding the importation of stock from other states.

This, together with talks by Dr. J. J. Whitten on pruning and by officials and experts in the employ of the fig

association on the outlook for fig jam, preserves and canned figs and the new confection, Fig Brownies, contributed to make the meeting stand out as the best agricultural gathering of the year in the San Joaquin valley.

During the day the institute accepted an invitation of Merced to hold the next institute in that city. Reports of the judges of the dried fig contest which has been conducted by the Peach and Fig Growers, Inc., was made to the chairman who awarded the prizes to the winners: Adriatic—1, Charles Dewhurst, Sultana; 2, H. C. Osborn, Reedley; 3, H. P. Osborn, Reedley.

Calimyrna—1, H. D. Tallman, Merced; 2, L. B. Pearson, Kingsburg; 3, W. R. Davis, Atwater.

Mission—1, E. G. Munier, Fresno; 2, H. P. Nielson, Selma; 3, R. L. Dewhurst, Dinuba. The judges were—G. P. Rixford, San Francisco; Lester Eastin, Fresno, and Ralph E. Smith, Berkeley. On Saturday the institute was given over to field meetings with demonstrations of practices of pruning fig trees and general fig culture.

Peter Tumbledown says he'd rather cut his wood with an axe, as the noise of a power saw hurts his head.

CANNING PEACH GROWERS

That the California Canning Peach Growers, Inc., the recently organized statewide association of canning peach orchardists, will attain before next harvest a place in the business world reached by other associations only after from two to three years of effort, is the belief expressed by officials at local headquarters. The reason for this unprecedented growth is believed to be the fact that the peach men have the experience of the other associations to start with, and also the fact that the very men who successfully engineered the other organizations are on the board of directors of the peach growing body.

A NEW PERSIMMON

A Los Angeles firm is this year offering a new Japanese persimmon, named Fuyugaki, a non-astringent which it is claimed may be peeled and eaten when quite hard, as apples are used. It is of light color in the flesh but a deep red on the outside and tree is very prolific. If this variety is all that the introducers claim a valuable addition has been made to our planting list.

CANKER STAMPED OUT

The work of stamping out citrus canker in Florida seems to have been done very thoroughly. The work started in May, 1914. The greatest number of cases discovered in any one month were 1,345, in August, 1915. In September, 1917, the fight seemed to have been won, only six cases being found in that month, and only in one month since that time have more than six cases been discovered. In July, 1920, the citrus world was startled to know that 539 cases were discovered. These trees were destroyed. The next month one case was found, perhaps the last cankered tree in Florida. I hope so. For 16 months now not a single case has been reported. In all 14,267 grove trees were found infected, but a total of 235,590 grove trees were destroyed, either because infected or by permission of owners, and 2,645,514 nursery trees were burned. In all 486 properties were infected, five of these properties still being watched and under quarantine. A most magnificent fight made under a splendid leader, the Marshal Foch of the citrus forces of Florida.

Questions and Answers

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Sore Ears and Cause

What is the cause of Flemish Giant rabbits having sore ears and what can be done for it?—Subscriber, Watsonville.

A mite bearing the name of dermatocoptes which works in the wax of the ear similarly to the mite that causes scaly leg in chickens. This disease must not be neglected, as it works back into the head, inflammation sets in and misery and death follow. One tablespoon of sulphur in a vaseline jar of olive oil makes a good and effective medicine. Use twice a week till cured.

WE Solicit Your Order For Nursery Stock Because

STAWBERRY PLANTS

That Please the California Fruit Grower. G. J. Streicher, Napa Co., Cal., writes: Jan. 7-22. Received strawberry plants today in fine shape, they are nice clean, well rooted stock. The inspector said they were the best rooted plants he had ever seen.

Our New 1922 Catalogue describing more than 25 varieties and containing other information now ready. get your FREE copy quick.

V. R. ALLEN, Seaford, Delaware

Once or twice is sufficient. Use brush or medicine dropper for applying medicine. Neglected colds, dirty hutches causing dirty feet are often the cause. Dirt falling down from hutch above will often cause it. Clean hutches thoroughly where animals are, as disease is contagious.—W. D. W.

Ashes on Alkali Soil

Will putting wood ashes from our stoves on soil inclined to be alkaline injure or benefit orchard?—Subscriber, Durham.

Dr. R. R. Snowden answers: "The effect of adding wood ashes to a soil inclined to be alkaline would be to increase the alkali; but if gypsum (one-fifth the amount of the ashes) be added at the same time it would be equivalent to adding sulphate of potash and carbonate of lime, both beneficial to most soils."

Homestead

What is the usual period of residence upon the federal homestead land. I was at one time informed that it was three years?—Subscriber, San Marcos.

We are informed by the federal land office that required residence on homestead is seven months per year for three years.

Worms in Pot Soil

Will you kindly tell me what I can put on my house plants to kill the worms in the ground? At first little black flies appear on the top of the ground and then little white worms infest the ground and the flowers wilt and die. Some of the worms are pretty good size. Have put sulphur on them.—Subscriber, Napa.

Plants in such soil are best repotted and all old soil washed from the roots and the pots washed and dried before repotting. If short of pots for changing place them in oven as soon as washed, for immediate drying. After repotting keep in cool close shady place for a few days and at the end of a week at most move to a warmer shady place. If one fears to do this work or lack of time prevents, lime water is often effective. Use as much quick lime in the water as you choose but allow it to settle until water is clear before using. Weak tobacco water, frequently applied, will not harm the plants but will destroy the insects.

Bloomless Blackberries

I have some thornless blackberries three years old that do not bloom. They are just a mat of small vines. Should they be divided and reset, or how should they be pruned?—A Reader, Selma.

The condition of these suggests their growing in heavy soil with an insufficient supply of water. With such a feeble growth they should not need division. Cut all tops off down at roots, loosen up soil well, dig in some good fertilizer, leave a mulch of same on top and water freely. When tops start and are a few inches high, break off at root all but four strongest canes to each vine. If this does not overcome trouble it is best to get new vines.

Grapes for Palo Verde

What grape will thrive best in the Palo Verde Valley?—D. M. B., Los Angeles.

This question was put to Prof. Bioletti in person and he answered that of the standards Malaga was the best. Of the new varieties Molineri is proving a winner wherever planted in hot dry sections and bids fair to become

the leader. Prof. Bioletti says that any grape growing in the Imperial Valley should do equally well in the Palo Verde Valley.

Grafting Walnuts

I have a black walnut that I wish to work over to an English walnut. Should it be budded or grafted, and how and when?—F. V. V., Selma.

Walnuts are grafted in February or March, according to season. Full directions are given on another page of this issue.

White Fly

Last summer we had a row of pole beans and they looked fine and healthy until after we started picking. All at once the beans seemed sticky and the leaves started to thicken and when we picked the beans it seemed millions of little white insects or flies flew in the air just like gnats. What were they and what can we do to get rid of them? They were also on sweet peas and other flowers.—Subscriber, Lone.

The insects were one of several species of alyrodes or white fly. Best means of eradication is by a weak solution of nicotine in a spray or resin or whale oil soap spray. The insects are easy to destroy, but that will not help present crop as spray will damage beans or peas for marketing as much as the white fly. The visits of this pest are but seasonal and this year you may have none. It is doubtful if it is advisable to do more than observe clean culture, which is one of the best control measures. Keep down the weeds.

Eastern Holly

Will Eastern holly grow here and bear berries, and can one start the plants from berries?—Subscriber, Rivera.

All hollies will grow here but not so rapidly or so well "furnished" as in damper climates. Select cold damp situation, if possible, as opposed to a hot dry one. The hollies will grow from berries but are slow to start and need a constant good moisture supply without lots of watering. Therefore leaf mold and sand in equal quantities, or this and one-half good humous soil, makes a fine medium for starting seeds. Do not allow to get dry, and keep cool though it is not necessary to put in full shade.

Blower's Blackberry

What can you tell me of Blower's blackberry? Can you recommend it as a commercial berry?—Subscriber, Aromas.

We do not find Blower's blackberry listed in either California or Eastern catalogs. The best commercial berries for this state are those advertised in the Cultivator.

Fruit Pits and Seeds

Will you please give me the address of some one from whom I can obtain Myrobalan pits for seedling purposes, and also apple and pear seeds for the same purpose?—Subscriber, Chowchilla.

Fruit pits and seeds are handled by seed stores and fruit tree nurseries, and as you ask about standard varieties, we would advise writing one or more firms advertising in the Cultivator.

Distance Apart

What is best distance to plant peach trees apart? Twenty feet is the usual distance but have been told trees would do better if planted 24 by 24 feet.—Subscriber, Livingston.

Here is a practical question for which we would like an answer from practical growers. Peach growers, what is your opinion? Twenty feet apart gives 108 trees to the acre while

22 feet apart permits of setting 90 and 24 feet apart will give 75. We believe as a rule planters do not exceed 22 feet, most of them preferring 20 feet for the peach, and in case of very strong growing trees, pruning severely to allow entrance of light and air. Of course greater care has to be exercised in planting stronger growing varieties too close together. Likewise in good rich soil the stronger growth calls for the greater distance. "Obviously in laying off the land by any system, the first decision must be in regard to spacing the trees. Common distances are 18 by 18, 18 by 20, or 20 by 20 feet, requiring respectively 134, 121, and 108 trees to the acre. Closer planting is sometimes practiced, but it is rarely advisable, while under some conditions 24 by 24 feet probably does not allow the trees more space than they need. The latter distances are perhaps used in California more often than in other parts of the country. Authorities in that state advise never to plant closer than 24 feet apart each way unless on sandy soil. Moreover, the topography of the land, the fertility of the soil, the varietal characteristics of the trees, and the preferences and convictions of individual growers, are all factors to be considered."

Capacity of Silo

To settle an argument will you kindly let me know how much corn silage a 10 by 20 foot "inside diameter" concrete silo would hold if properly packed.—Subscriber, Escondido.

We take it that by 10 by 20 our subscriber means a silo 20 feet high with 10 feet inside diameter. A silo 10 feet in diameter and 20 feet deep will contain 26 tons of corn silage two days after filling. After several days the silage will settle and possibly as much as five feet more can be filled in which will somewhat increase the weight.

Squabs

Are there squab breeding farms in California? Please give addresses.—Subscriber, Dinuba.

There are probably thousands of squab breeders in this state. At one time there was an extremely large "farm" near the city of Los Angeles. The flood of the Los Angeles River some six or eight years ago washed it out, however, and since then the industry has been left to smaller breeders. These are too numerous to give addresses but the liners or classified ad columns of the Cultivator have at times addresses of breeders.

Sudan for Pasture

A subscriber writes regarding alfalfa field badly fouled and of little value as pasture and asks as to Sudan seeded on the alfalfa, using field as a pasture. The question was referred to H. L. Müsser, who writes:

"Let us suggest that you sow Sudan grass on your wornout alfalfa field. That will give you an abundant pasture and some hay, and we would advise that you sow not earlier than the first of May. On your alfalfa field that had been freshly cut, disk the field and irrigate it, and you will be sure to get a good stand of Sudan grass and will be well rewarded. With regard to sowing Sudan grass and sweet clover, they do not work very well together. Sweet clover a winter growing plant, and if you sow it in the fall the Sudan will probably decay before spring. If you sow it in the spring the sweet clover would not be established before the hot weather. If you try that mixture at all it would be best to sow the clover in the fall, and if you have

a good stand that is well enough, but if there is a poor stand of clover, then we recommend that you sow the Sudan grass. If you want to sow a mixture of grasses, together with a legume, we recommend that you sow barley and vetch for fall planting and for spring planting Sudan grass and whippoorwill cow peas. Our firm advice, however, is to go over your old alfalfa sod about the middle of April with a disk and sow a quantity of Sudan grass, harrow it in and give it a good irrigation. That would be the quickest and most economical process to attain the results you are after."

THE IRRIGATION OF ORANGES ON THE WEST SIDE OF THE SACRAMENTO VALLEY

(Continued from Page 93.)

bution being effected by the well known overflow system. At Orland and at Corning the water is delivered in open ditches to the plantings, and is applied by the regular furrow system. At Hamilton again the Mills Orchards Corporation uses the concrete distribution system throughout, pumping directly from the wells into 18 inch carrying lines and then distributing to the furrows through lateral pipe lines and standard orchard standpipes such as are in common use throughout Southern California.

Records taken for the past few years have shown that it is absolutely imperative that the irrigation of the citrus be delayed in the spring as late as possible. The water is very cold, running normally about 17 degrees Centigrade, and when this is applied to the cold ground early in the season, particularly during or shortly after the blossoming season, a fruit drop invariably occurs. This is particularly true on the cold red soils which easily become waterlogged.

The best cultivation practices, which consist of very heavy subsoiling and the use of increasing amounts of manure, grain straw, rice straw and other organic materials which are available in the North in unlimited quantities at almost cost of hauling, are rapidly putting all of the orchards into such shape that with the heavy winter rains it is possible to carry them well past the normal June drop period. Growers are also finding that it is necessary to do their plowing in the fall and to do away with all fall and winter cover crops, carrying the orchards clean throughout the winter so that they can work up their early mulch, pack their soil, and cause it to warm up in the spring as early as possible. The normal irrigation season then commences immediately following the June drop period, and from then on water is applied by the furrow system, at least once a month, or when summer cover crops are carried, as is becoming the practice more and more every year, every three weeks to a month.

Due to the depth of the soil practically all over the valley, the water penetrates the soil a great deal more rapidly than it percolates laterally. The water seems to sink straight down from the furrow with very little lateral movement. It is therefore necessary to run from six to eight furrows in order to thoroughly wet all of the surface soil without running the water from 72 to 96 hours. The soil auger is being used more and more by all of the growers to enable them to determine the penetration of the irrigation water. With water in unlimited amounts it is very easy for the irrigators to continually pour it on if they do not have some such tool as the soil auger to advise them when the soil is thoroughly irrigated to depths running from four to six feet. In fact, we have found that the best results can be obtained when a heavy flow of water is run through the furrows for the first 12 to 24 hours, and the flow then cut down to a smaller stream running for another 24 hours. Penetration to about six feet is thus obtained.

We use a great deal more water on our citrus than is used in Southern California. We believe the trees require more water, due to the continued warm, dry days which we have throughout the entire summer. We have water ever in abundance and are able to grow tremendous summer

cover crops which are putting our soils into wonderful shape, some analyzing as high as 2.5 per cent organic matter. For the most part growers are using from 1 to 1 1/4 second feet continuous flow throughout the irrigation season, to the 100 acres, but with the excellent drainage throughout the district, and with the ability of the soil to carry heavy cover crops, this amount of water is not proving to be too much.

Summing it all up, the problem of the grower in Northern California is to delay his irrigation as long as possible in the spring, without allowing the trees to suffer in any way for water, and then to apply only enough water to carry the trees along in the best possible condition. His whole problem is not in using too little water but in using too much too frequently. To demonstrate what good soil, abundance of organic matter, and careful, systematic irrigation practice can do for orange growing in the Sacramento Valley, the following record of sizes shipped by the James Mills Orchard Corporation, at Hamilton City, is conclusive evidence:

Sizes	Percentage of Total Crop
64s.....	.16
80s.....	7.38
96s.....	.03
100s.....	30.89
126s.....	30.94
150s.....	17.62

200s and up.....	6.21

JUDGING CORN

Corn shows pay too much attention to fancy or show points, say crop specialists of the Ohio state university who have drawn up for use at the coming State Corn and Grain Show a new card of points, based on the probable value of ears as seed.

Uniformity of size and appearance, trueness to variety type, straight rows, well filled tips and butts, and other requirements of the old corn score card are still considered, but are placed in importance below seed condition. More than half of the new point card deals with maturity, dryness, freedom from disease and other condition factors. Under this head are included two points which are just beginning to receive consideration from corn judges. It is stated that unless ears show that the shank attachments which connect the ear with the stalk have broken off smoothly without leaving shreds and discolorations, the ears will be thrown out.

EDIBLE AUSTRALIAN NIGHT-SHADE

In California gardens there is sometimes grown a half woody, leafy, spineless, blue flowered nightshade four to six feet high, as an ornamental hailing from Australia, by name Solanum aviculare. The flowers are followed by an ovoid orange yellow berry or fruit an inch long, and edible only when fully ripe.

Dr. Maiden, colonial botanist of New South Wales, in "The Native Useful Plants of Australia," says: "The fruit, when perfectly ripe, which is indicated by the outer skin bursting, may be eaten in its natural state, or boiled or baked. It has a mealy, subacid taste and may be eaten in any quantity with impunity, but until the skin bursts, although the fruit may otherwise appear ripe, it has an acrid taste and causes an unpleasant burning sensation in the throat."

LITCHI NUTS

A fine tree of the genuine "litchi" is growing on the Spinks ranch at Duarte, together with some of the nearly related but inferior "longans." The litchi nut is the loosely shelled "li-chee nut" sold at Chinese stores and by Chinese street peddlers, though not properly a nut. It is said by those who have eaten them in China that they are most delicious when fresh and never improve with age. The writer was given a box of these nuts lately received by an Angeleno who formerly lived for several years in China. They were much fresher than any heretofore eaten and very much superior in flavor and texture. The meats were not dried down to a tough leathery pulp and little of the "burned prune" taste was noticeable. The tree has always been hard to grow when away from China, soil conditions seeming the most important factor, for they have been planted in all sorts of climate.

Every Tree a Perfect Specimen

From the planting of the seed to maturity, our experienced Avocado grower has personally used every proper method to produce a vigorous, dependable tree. Every tree will prove satisfactory to the most exacting grower.

In this field are the five varieties recommended by the Avocado Association—Dickinson, Fuerte, Pueblo, Sharpless, Spinks—also Knight, Linda, Queen, Tiger, Wagner, Lyon, Canter, Northrup and Robertson.

You are invited to see our trees before you purchase. Catalog, describing all varieties of Avocados, mailed free upon request. Gives complete cultural instructions and describes all kinds of trees and plants for the orchard and the beautification of your grounds.

CAPACITY OF PIPE

The following table gives quick determination as to carrying capacity of various sized pipes under different "heads." As an example in the use of the table, find "6" in first column indicating a six foot "fall" or "head" to 1,000 feet. Then read to the right and in ninth column under "12 inch pipe" and it will be noted that the number of miner's inches carried by a 12 inch pipe having the six foot "fall" or "head" is 129.5.

GARDEN SLUGS

E. M. Ehrhorn, chief plant inspector for Hawaii, says: "Slugs are serious pests of the flower and vegetable gardens. Feeding at night, few people have observed them and only those who actually work among the plants have found them resting under fallen leaves, stones or other rubbish during the day. They multiply very rapidly, laying their eggs in clusters in the soft earth. All varieties of plants are attacked, but they prefer tender seedlings. Control measures are of little use as the pest wanders about considerably. Collecting them in the evening will materially reduce them in the ordinary garden. The use of a sharp pointed stick, or better, an ice pick, has been found useful. Usually after a good rain they become more active and crawl over the lawn in the evening. As many as 150 have been collected in half an hour by piercing them with an ice pick or sharp pointed stick. Piercing the body kills them and they soon shrivel up or the bodies are devoured by ants.

"Having the habit of hiding under rubbish, stones or leaves, artificial hiding places or traps can be made by using large leaves such as cabbage, taro, banana and canna, and placing these on the ground near tender leaves after wetting the soil. A few thin boards or shingles can be used instead of large leaves. After feeding during the night the slugs will crawl under these leaves and can be killed the next morning. Now that the rainy season is at hand it would be a good time to reduce this pest by the above method."

POTATO WART DISEASE CONTROL

Extensive surveys conducted during the last fiscal year have pretty well eliminated the chance of countrywide infestation at this time by the potato wart disease, according to the United States department of agriculture. It seems to be pretty clearly established that the disease is now limited to comparatively small areas in Pennsylvania, West Virginia and Maryland.

The only new infestations are those determined in three villages near Frostburg in western Maryland, which lie practically between the western Pennsylvania and the West Virginia infested districts, and are, similarly, mining sections. Some 1,000 individual garden plats in these three states have been determined as infested, but the total areas of these plats aggregate less than 100 acres. The three invaded states are enforcing effective quarantine measures, it is said, and, as these seem adequate for the protection of surrounding states, no domestic federal quarantine on account of the disease has been promulgated by the department.

Very important results have been obtained from the department's studies, notably the immunity to the disease determined for certain important classes of potatoes and the possibilities of local control by limiting plant-

ings to such immune varieties and by direct corrective work. This outcome has largely eliminated the fear that the wart disease might follow the same destructive course in this country that it has in parts of Europe.

FEDERAL HIGHWAY MONEY

The total of federal aid funds for road building apportioned among the various states up to the present time by the bureau of public roads, United States department of agriculture, aggregates \$339,875,000, according to a tabulation prepared by the department and just made public. Of this sum \$73,125,000 is apportioned under the federal highway act, approved by President Harding November 9, last, and \$266,750,000 represents the total apportionment under the old acts.

Under the terms of the new act the federal aid money will be available to the states for two years after the close of the fiscal year for which the money is appropriated. This provision is made to apply to the money appropriated under the previous act and its amendment as well as to the new appropriation. Accordingly, the new appropriation must be expended by June 30, 1924, and the time allowed for the expenditure of the balance of the previous appropriation which remains in some status is extended to June 30, 1923. The forest road appropriation is available until expended.

The new appropriation is to be expended upon a definite, connected system of highways in each state, of not to exceed 7 per cent of the total mileage of highways already existing in the state. This system is to be divided into two parts; the first to include the more important roads, which are to be known as the primary or interstate highways; the second to include the secondary or inter-county highways. The primary roads, it is provided, shall not be more than three-sevenths of the mileage in the system. The second part will make up the balance of the system.

ALKALI SALTS

Greaves, Carter and Goldthorpe of the Utah experiment station carried out an investigation to determine the relative toxicity of various substances found in or applied to a soil, as measured in terms of bacterial activities of the soil, as well as to determine the stimulating influence of various substances upon bacterial activity, and the manner in which it is exerted. The soil used was of a sedimentary nature (sand and silt) in which all the elements of plant food were present in abundance with the exception of nitrogen, of which the amount did not exceed .15 per cent.

The commonest soil alkalis are very toxic to the nitrifying organisms and greatly reduce the nitric nitrogen accumulation. In the concentrations tested, however, most of the salts acted as stimulants. The only salts which did not act thus were sulphate of sodium, carbonate of sodium,

carbonate of calcium, sulphate of potassium, carbonate of potassium and iron nitrate. Chloride and sulphate of calcium increased the nitric-nitrogen accumulation of the soil 67 and 97 per cent respectively. On the other hand, the nitrates in some concentrations caused loss of nitrogen, and in others, the fixation of nitrogen. Nitrate of manganese proved the strongest stimulant.

The ammonifying powers of a soil containing alkalis are a better index to its crop producing capacity than the nitrifying powers; but those compounds which are the strongest plant stimulants are also the most active in increasing the nitric-nitrogen in the soil, and it is very likely that the effect upon the plant is due mainly to the action of the chemical compound upon the bacteria which in turn render available more plant food. It should also be noted, that, though many of the nitrates caused large losses of nitric-nitrogen, this was due to their stimulation of species of bacteria which transform nitric-nitrogen into protein nitrogen, and was not the result of denitrification.

BEAUTIFY HOMES

Make the grounds immediately surrounding the farm home at least as attractive as the average city lot. The owner of the latter may be a laborer, a bank clerk, or of any trade or profession, but the chances are strongly in favor of the farmer and his family knowing more about growing plants than the lot owner and having just as much time to care for them.

Have plenty of trees for shade and shelter, as well as for ornament. Plant flowering shrubs about the house foundations and around the garden boundaries, especially in the front yard. Put in some herbaceous perennials. Once or more each year broadcast seeds of annuals in all bare spots in the garden, so that a constant change may be had. Native flower seeds of both annuals and perennials may be sown now, in mixed lots, and provide a succession of flowers until rains come again, and some of them will remain with you for all time if you so wish. By planting largely of native California material little care will be exacted and then when farm cares will allow you may give the garden the "once over" and clean it up a bit. From any standpoint such planting pays.

AUSTRALIAN ORANGES

From a South African farm journal we clip the following:

"A trial shipment of 3000 cases of oranges from South Australia was sold at Covent Garden at the rate of 31s 6d. per case (about \$6.50). It is said that the appearance and flavor of the fruit impressed the experts, some of whom are of the opinion that with improved attention to export conditions further shipments of these oranges will command a higher price than the best South African fruit."

Legal Queries

Louis B. Stanton, attorney, 343 Wilcox Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 317 Central Ave., Los Angeles.

Payment on Check

I had a checking account at the bank upon which I gave a check to a merchant. Later I drew out the balance. The check was not deducted and the bank now notifies me that they honored the check and request me to pay them the money. Can I be required to do same?—Subscriber, Inglewood.

A check is a promise to pay much the same as a promissory note. Either you would be liable to pay the party to whom you executed the check or an endorsee or assignee of that party. The bank is undoubtedly an assignee of the payee and could bring action against you upon the check.

Investment Company

I wish to organize an investment company to finance various projects. Would it be better to organize this under a declaration of trust or incorporate under the California laws, or elsewhere?—Subscriber, San Diego.

It depends very largely upon the particular operations of any business as to whether the trusteeship plan would be at all applicable. Where it is applicable it is undoubtedly one of the best methods of handling trust property, but it is particularly adaptable to the close or family corporation rather than to a plan where stock or interests are sold broadcast. The California laws are sufficiently broad so that it is usually better to incorporate here under them. If a corporation is made under the laws of another state it is subject to taxation in such state as well as in California. It is generally only the larger or holding companies which do comparatively little actual business to which the foreign corporation is specially adaptable.

Road on Section Line

I have a relinquishment for a section of land which is the central 160 acres of four different sections. Can I require a road to be brought through my land on any of the section lines?—Subscriber, Seal Beach.

There can be no objection to your putting a road through your own land in any way you see fit. You could probably not make a valid dedication of the road until patented title had been obtained from the government. So far as forcing a road to be driven along section lines of your neighbors, the writer has never been able to find an authority to justify the idea which seems to be prevalent that a road is reserved along section lines under the patent given by the government. It is true that it is customary in new countries to open roads along these section lines and in many instances no objection is made. But on the other hand the government patent runs up to the full boundaries of the 640 acres and contains no reservations, so it would seem that it is necessary to call upon the county authorities in the usual way to open a road if any is desired and there are any objections made by the owners of surrounding lands to anyone passing over their lines.

Separate and Community Property

A widower with children owns 20 acres of land and water stock. After marriage he plants the land to trees. Has his second wife a share in his property if he chooses to will it to his children? If he should die without will what would be the legal distribution of the property?—Subscriber, Covina.

These questions involving property

which is in part separate and in part community property are some of the most difficult which arise in the law. It would be necessary to make a careful investigation of the particular case in order to give a definite opinion. In so far as the separate property is concerned and considering the matter as separate property, in case the husband should die without will one-third of the property would go to the surviving wife and the other two-thirds be divided equally between the children. If the wife can establish that a part of the property is community property, that is to say, a usufruct over and above the living expenses of the community, which has been invested in the property; as to such portion she would be entitled to one-half. The other one-half, as all the separate property, would be absolutely subject to the disposition of the husband by will.

Marriage of Divorced Persons

Can a divorced couple who were resident in Oregon marry in California before the six months is up which under Oregon decree they are required to wait before marrying again? If they should marry in California, what would happen to them if they went to Oregon?—Subscriber, Earlimart.

It is difficult to determine whether the question refers to a remarriage of the divorced parties or to a marriage of each of the divorced parties to someone else. It would undoubtedly be true that if the divorced parties remarried each other such marriage would be entirely valid, although it would be well for them to have the Oregon decree set aside. Under the Oregon statutes it probably is true that neither of the parties would be free to contract marriage with a third party as the Oregon statute declares that neither party would be capable of contracting marriage with a third person and if he or she does so contract will be liable therefor as if such decree had not been given until the suit has been heard and determined on appeal. This statute has been considered in Oregon to mean that a marriage of a third person within the period of the six months would constitute bigamy in Oregon.

Appraisal Fee

I made application for a loan, paid the appraiser fee which he required, of \$20, with the understanding that if the loan was rejected fee would be returned. It has not as yet been returned nor has the application as yet been approved. Can this fee be kept?—Subscriber, Wasco.

If the fee was paid to a private loan company it would be difficult to state whether there was an obligation to return. If your question refers to applications under the federal farm loan act, the law prescribes that loan bank appraisers should receive such compensation as the board may fix and will be paid by the federal loan banks and the joint stock loan banks, which he serves, in such proportion and in such manner as the loan board should order. It would be best for you, therefore, to take the matter up through the local loan association, or, if necessary, directly with the federal bank at Berkeley as the appraiser is paid by the government.

Irrigation District Taxes

I have been irrigating land with an electric pump and am about to be included in an irrigation district. There is no ditch nearer than a mile. Must a district put in a ditch to my land before they can collect taxes?—Subscriber, Fresno.

The irrigation act expressly provides that all waters distributed for irrigation purposes should be appor-

ON THE ROAD EVERY DAY THIS WINTER

Copyright 1922, by The Goodyear Tire & Rubber Co.

"We get snow a-plenty in this section every winter, but our truck on Goodyear Cord Tires averages two capacity trips a day regardless of road and weather, cutting our wagon-haul time to South St. Paul Stockyards with livestock from more than three hours down to forty-five minutes."
—E. L. YETZER, Yetzer Bros., Farmers, Richfield, Minn.

Their sure-footed traction on snow-filled roads, maintaining regular deliveries throughout the months that once were closed to all farm hauling, is one of the most valuable advantages of Goodyear Cord Truck Tires.

Their All-Weather Tread, with its wide surface of sharp, gripping edges, gives them a firm hold on slippery surfaces and in thick, slushy going.

Their buoyant resilience favors the truck mechanism, cushions the driver

and the load, and protects improved roads.

The durable qualities incorporated in these tires by their exclusive Goodyear design and construction prolong their all-season, all-weather usefulness through thousands on thousands of miles.

Actual experiences of farmers hauling on Goodyear Cord Truck Tires are reported to those interested by The Goodyear Tire & Rubber Company, Akron, Ohio, or Los Angeles, California.

FRUIT TREE CATALOG (65 Pages)

Fully Illustrated. Contains much information of value to planters
Sent FREE on request

In preparing our 1922 catalogue, it has been our desire to make it not only a descriptive book telling the kind of stock we grow, when and how to plant and care for it, the prices at which it sells, and the effects it will produce, but also to give our many customers information showing how the stock itself is produced, the care that has been exercised in its building, together with lots of little helps heretofore not found in any nursery catalogue.

GEO. C. ROEDING, President

Fancher Creek Nurseries

Fresno, California

\$39.50 Buys Kirstin ONE MAN Stump Puller

World's lowest priced One-Man Stump Puller—light, fast, powerful. Weighs only 100 pounds—manufactured by makers of the famous **KIRSTIN STUMP PULLERS**. Price includes Tool Steel Ratchet Bar—Carbon Steel Dogs—All Steel Long Lashed Chain—Extension Bar—Hook and Steel Anchor Cable.

Try It Out for 90 Days Low Introductory Price. Good only limited time. Write for 90 days' offer and free Catalog—or send \$5 and pay \$34.50 when Puller arrives.

Read These Letters
Cleared one and one-half acres in two days. Also pulled 18 inch Maple Stump in five minutes. A. Johnson, B-47, Chatham, Mich.
I pulled 800 stumps in five days—up to 24 inches through. C. Noss, Big Falls, Minn.

A. J. KIRSTIN COMPANY
4207 First St. Escanaba, Mich.

tioned rotably to each owner upon the basis of a ratio which the last assessment of such owner for district purposes within the district bears to the whole sum assessed upon the district, and it is also made the duty of the directors to furnish to each land owner in the district sufficient water for irrigation and domestic purposes. The irrigation district is, however, organized for the purpose of making the land within that district subject to the payment of the bonds which are issued unto purchaser in order to acquire the water rights and construct ditches so that water may be conveyed throughout the district. These bonds are sold broadcast to parties who perhaps know nothing of the conditions in the district. The interest and principal of the bonds must be paid by taxation on the lands of the district. If it is true that any one could resist a district tax because he does not have water, then it is easily seen that the bonds would be worthless as they would be dependent in each case on the fact that all the district was covered with water. Therefore, although a party has his remedy within the district, if he does obtain the water he cannot resist taxation on that ground.

Right of Way

In the case of two adjoining lands one bordered on the public highway but the other did not and was given the privilege of driving across the bordering tract. A public highway now borders both tracts. Can the other owner be required to seek outlet on his own property?—Subscriber, National City.

Unless a right of way across the easterly tract was granted or has been acquired either by prescription or in some other manner the owner of that tract may be required to cease crossing in the accustomed way. It is probably the case that he has acquired no right and that the gates may be shut against him and no great harm would be done by doing so.

Barley on Another's Land

I rented a piece of land but before I put it in seed another party sowed barley. I notified him that I had leased the land but he seemed to disregard this. At a later date I found him disking. Have I the right to har-

vest the crop?—Subscriber, Torrance.

If you have a lease on the land, at the time of the lease as to the occupation of the land, you stand in the shoes of the owner, and you are entitled to receive the use of the land and of all that is sowed therein. The other party having been fully notified could have no possible ground for claiming the crop and you would be, therefore, entitled to harvest the crop, unless perhaps he had a lease from the owner, in which case your action will be against the owner of the property for breach of his contract to lease.

Deed to Avoid Probate

In the event of death I wish to leave all real estate to my wife. Can I avoid the expense of probate by making deed to my wife to be delivered after death, or can I deed this property to a third party then have it deeded back in joint tenancy? Which plan is better?—Subscriber, Riverside.

Either plan, if properly done, will suffice to convey the property. In the case of the direct deed it is essential that the deed be actually delivered prior to death so that the entire dominion over the property passes from the grantor from the time of delivery. This arrangement has led to a great amount of litigation over the question of delivery. The creation of the joint tenancy is probably the safer method. Care should be exercised, however, that when the property is in the possession of the third party it does not become encumbered by reason of a judgment issued against such party.

Run-Off

Two farms adjoin; the slope over each is to the east. The owner of the east tract wishes to avoid overflow of waters. In such event who is required to make the ditch to collect the overflow water and on which side of the division line is the ditch to be maintained?—Subscriber, National City.

As to the ordinary flow of rain water entirely falling and running over the easterly tract the owner of the easterly tract would be obliged to protect himself. This is a comparatively rare event. As to all irrigation waters developed upon the higher land or brought thereon by irrigation ditches, the owner of the land on

which the water is brought must at his peril keep the water thereon, and if he forces overflow on the lower land he may be enjoined and made subject to an action in damages. Therefore, it would be necessary for him to, at his own cost, keep such waters from overrunning his neighbor.

Other Property Liabe

Where property under a trust deed does not sell for enough to pay the notes can other property not under deed be sold to make up the balance?—Subscriber, Wasco.

In such a case the amount for which the property is actually sold is credited upon the note and the holder of the note can thereafter bring suit to collect any balance remaining unpaid. In such suit he is entitled to levy attachment and execution upon other personal or real property, just as in the case of any other action upon a note.

Gophers and Dead Trees

A neighbor plies hay along our orange grove. Gophers make their home in this. Has she a right to do this? She also has a line of dead cypress trees standing close to the property line. Many have fallen and damaged our oranges. Can we make her take out these dead trees and the branches which overhang our land? Can we obtain damages for the loss caused by the falling trees?—Subscriber, Riverside.

If it could be proven that the nest of gophers was a nuisance she might be restrained from maintaining it, but your best remedy would undoubtedly be to make a complaint to your county horticultural commissioner, who is empowered to take measures to abate gophers. You probably would not be able to force your neighbor to take out the dead trees, but you are entitled to cut off any branches overhanging your land and would undoubtedly be entitled to damages for actual loss caused through the falling of these trees.

Joint Tenants

Property is deeded to husband and wife as joint tenants. There are three children. In case of the death of either parent what share goes to the surviving parent and what share to the children? Would a will make any difference?—Subscriber, Los Angeles.

The tenure or right under which the husband and wife each hold property is to the effect that upon the death of either the whole of the property will vest in the survivor. Such being the case, upon the decease of either of the parties his interest in the property immediately passes to the survivor and he has no interest which could pass to any child or which he could devise by will.

Condemning Roadway

I have property in a suburban community. It is proposed to run a street through which will cut off several feet and materially damage the property. Can I be forced to vacate?—Subscriber, Bell.

The state, county or city is invested with the right of eminent domain under which, when the governing body determines it is for the best interests of the public, a right of way may be condemned through property. Compensation for the damage caused and property taken must of course be paid.

Ditch Right

I purchased land some two years ago. The deed shows no ditch right. A neighbor who has not irrigated his land for six years now claims he is entitled to a right of way for a ditch. Can I prevent him?—Subscriber, Fresno.

Nothing is stated as to the ground

upon which the neighbor bases his claim for a right of way. If it is under some grant, then in order to be prior to your deed the claim must have been recorded before your deed. In such case you would undoubtedly have a right of action for any damage caused against the party who sold you your land. It would seem that if he has a claim by user such claim would have been abandoned if he has not used it for six years. But it will be necessary to know the grounds upon which his claim is based in order to determine whether it is a valid claim or not. The best way would be to refuse him entrance and then he would be obliged to show his claim in some action for trespass.

Inheritance Tax

A man owns real estate prior to marriage. After marriage, in a Torrens title it is set forth that the land is possessed in joint tenancy with right of survivorship. In case of the death of either husband or wife will the estate be subject to inheritance tax?—Subscriber, Whittier.

The present inheritance tax law provides that whenever property is held in the joint tenancy of two or more persons the right of the surviving joint tenant is determined by a transfer made under the provisions of the act in the same manner as though the whole property belonged absolutely to the deceased and had been devised to the survivor, except such part as the survivor may prove to have originally belonged to him and not to the decedent. It therefore appears that in case of the wife's death, the property never having belonged to the wife, it would not be subject to the inheritance tax. But in the case of the husband's death the whole of the property would be subject to the tax.

Sanitarium Bills

If a father who has property and money is taken seriously sick and wants to go to a sanitarium, and his sons, who also have property, take him there; when the father's money is gone can the sanitarium attach the money of the sons?—Subscriber, Valley Center.

If the sons contract with the sanitarium for the care of the father such care would be a good consideration for their agreement to pay and they could be rendered liable on such contract. It would turn entirely upon the question of the contract. If they did not contract then the sanitarium would of course be required to exhaust the property of the father and very probably would have no action against the adult children.

Natural Drainage

My land drains its storm waters over my neighbor's land. There is no other outlet. Is he entitled to build a dyke and back these natural storm waters on my land?—Subscriber, Riverside.

Insofar as naturally falling storm waters are concerned the owner of the land is entitled to have them flow along their accustomed channels. Your neighbor is not entitled to back these waters onto your land and you could recover for any damage thereby caused. This rule does not apply, however, as to irrigation waters which are brought upon your land, as to which the rule is the reverse.

Damage From Straying Horse

My horse has broken away and gone on a neighbor's premises a few times. The neighbor threatens to collect a bill of damages. What are his rights?—Subscriber, Redlands.

His rights would depend entirely upon whether or not his land was entirely enclosed by a substantial fence

Alfalfa Seed

Planting Time is Here; Let Us Suggest You Plant HAIRY PERUVIAN (Certified-Unmixed Seed)

The U. S. Dept. of Agriculture says: "In experimental tests covering a number of years PERUVIAN alfalfa has yielded decidedly more hay per acre than ordinary alfalfa, the increased yield per season being about three-fourths of a ton per acre."

We also have a stock of splendid COMMON (Chilian) and SMOOTH PERUVIAN and Guarantee Our Seeds to be TRUE TYPE, UNMIXED, and of best quality

To get your requirements: If a press drill is used sow 15 lbs. per acre, and for broadcast sowing use 20 lbs. per acre.

TO YOU, MR. PLANTER AND DEALER, WE SAY PURCHASE YOUR REQUIREMENTS FROM AN OLD ESTABLISHED SEED FIRM THAT GUARANTEES SATISFACTION. Write, telegraph or 'phone us for quotations. Don't delay until tomorrow, but DO IT NOW before the season gets away from you.

All our seeds come from Certified fields, and as we have been established in this one business here for the past ten years, we can give you the choicest seed.

or otherwise enclosed, and in such case if planted with growing crops, vines, fruit trees or vegetables, he would be entitled to recover from you actual damages sustained by trespass, together with costs. Otherwise, under the laws of this state he would probably be unable to recover anything.

Ditch Right of Way

For the last two years I have been running water from a ditch through my neighbor's land. Can he stop me at any time? Must I pay him for right of way? If so, how would price be fixed?—Subscriber, Gridley.

Unquestionably this right of way has been used as a mere license and can be revoked at any time. If you desire to acquire a right of way you would be obliged to pay your neighbor whatever price he wishes to ask.

Fulfilling Contract

I purchased land on contract, afterwards sold one-half of it. The buyer paid part cash, received a deed and gave back a mortgage to my vendor, who made a new contract with me for the remaining property. The man who purchased from me is now unable to make his payments and the owner intends to foreclose. In the new contract which I made it was understood that I would not be released until an additional amount had been paid. Must I pay this additional amount and also lose the land?—Subscriber.

You will certainly be entitled to redeem from the mortgage foreclosure. In the absence of the exact terms of the contract it would be difficult to state whether there was any obligation to pay the \$1,000, but it would seem that any amounts which your vendee had paid would be credited upon your gross payment. In such case it is necessary to see the contract, as it is, in order to give any statement.

Veterinary

Answers in this column by Dr. Wm. Petrie, 2714 South Harvard Blvd., Los Angeles, are without charge. For immediate mail answer remit \$1.00. In writing questions give full symptoms or particulars of injury of animal.

Orphan Lambs

Is it advisable to feed "bummer" lambs calf meal if they have first been started on cow's milk? Please advise what to give baby lambs for bowel trouble (dysentery). As lambs get older can they be fed dry or wet mash?—Subscriber, Orland.

Calf meal should be all right for lambs. Add a little of the calf meal and a little water to the milk you are giving. Decrease the milk and increase the meal gradually. They should have some alfalfa hay where they can nibble at it. Dry mash is better than wet and would be better if mixed with a little cut alfalfa. Wet mash is likely to cause dysentery and bran in any mash is irritating to the bowels and likely to cause dysentery.

Udder Trouble

I have a six year old, pure bred Jersey cow that has been in perfect condition. In drying her off the right front quarter shrank in size and gave less than half as much milk as the others and the teat is still smaller than the others. There was no inflammation in the udder. It is time for her to calve again. What treatment shall I give her to prevent losing the quarter?—Subscriber, Winton.

Hand rubbing (massage) is the best remedy we know of. As often as you milk her spend some time rubbing that quarter and rolling it between the hands. Do not use too much force in handling the udder. Gentle and frequent rubbing will increase the flow of blood to the parts and good

fresh blood is the greatest remedy for nearly all diseases.

White Scours

What is wrong with our calves and what is best to do for them? They come from healthy cows that are well kept and well fed. The calves receive the mothers' fresh milk and are fed regularly, but when one or two weeks old they run off at the bowels and on the second day lose their appetite. We have had ten calves affected in the same way. Three of the younger ones have died. They are kept in a clean, dry pen with plenty of straw. We reduced the milk and scalded it and in some gave cholera remedy and in some half a teaspoon of nutmeg and one tablespoon of browned flour. The older calves got better while the calves one week old died on the third day. Some of the neighbors have had the same trouble with their calves.—Subscriber, Pleasanton.

This is probably the white scours that has caused so much trouble in the eastern states. It is due to a germ that is in the dust about the stable. It gets onto the cow's udder and some gets into the milk. The stable, sides, ceiling and floor, should be swept clean and, whitewashed. A little carbolic acid or zenoleum should be added to the whitewash. The cows should be thoroughly groomed and the udders washed. It does not seem to affect the cows nor the milk for other use. When a calf first shows signs of the trouble something should be done at once. Some good internal antiseptic should be given. Five grains of tannic acid and ten grains of powdered gentian mixed in half a cup of boiled milk twice a day will usually cure them quickly. Do not give the milk hot. Or five drops of zenoleum in half a cup of boiled milk twice a day has given good results. Do not delay the treatment, as the disease is very exhausting and the young calves cannot endure it long. Of course they must be fed a reasonable amount of milk besides what is with the medicine.

Sick Goat

I have a milk goat that gave after her second kidding a gallon of milk a day. After giving milk about six weeks she got sick. She had a stoppage of the bowels, a high fever, and came near dying. One side of the udder swelled up so it was hard and had no circulation of blood in it, as it was cold. I called a veterinarian. He gave her some medicine and told me to put antiphlogistine plasters on the udder. I did, but nothing had any effect until I washed the udder with saltpeter water. It softened up rapidly then and a month later a large bunch formed in the front part of the udder. When we opened it a thick yellow pus came out. It soon healed but two months later another smaller bunch came and broke as the first. She seems well now and is about dry. What can we do to prevent the bunches forming again?—Subscriber, Long Beach.

Goats and cows that are large milkers must be great eaters to supply the flow of milk. They have a ravenous appetite and will often pick up an old rag or something that will upset the digestion and cause just such trouble as you have been having with your goat. In the future be careful what she gets to eat. Regarding the udder; if it gathers and breaks again make the opening in the skin larger and do not let it close until it heals solid from the bottom. Wash out the cavity once a day with a solution of permanganate of potash, using a dram to the pint of water. Internal remedies would do no good. Be sure she gets plenty of clean water to drink and feed her green feed that will keep the bowels regular.

A hog auction sale at Meridian is being arranged by the Sutter County farm bureau for the middle of February.

GENUINE

Hairy Peruvian ALFALFA SEED

This is the mark of the grower to you, so you may be sure you are securing GENUINE HAIRY PERUVIAN ALFALFA SEED—SELECTED, INSPECTED, CERTIFIED!

RED SEAL BRAND CERTIFIED HAIRY PERUVIAN ALFALFA SEED protects you against substitution of other seeds for Hairy Peruvian—a fact which has been known to exist. YOU can now avoid any chance. You can be SURE you are getting GENUINE HAIRY PERUVIAN ALFALFA SEED, because we have enforced every precaution and taken every care that ONLY the GENUINE HAIRY PERUVIAN ALFALFA SEED of highest grade is allowed to enter our trade-marked bags bearing the RED SEAL "Sign of Honor."

Sold ONLY in the Original
Trade-Marked Bag "Red Seal"
Offers Positive Identification

Below you will see a picture of the bag and its inscription—the only way you can secure this seed, as it is sold only in the original bag. Bear this in mind when you purchase—LOOK FOR THE BIG RED SEAL ON THE BAG, it is the mark of identification.

Over 150 Dealers Now Have
Red Seal Brand Hairy
Peruvian Alfalfa Seed

Good seed dealers are alive to the advantage of handling a quality product—one that is guaranteed and which is backed by our "Sign of Honor." There are over 150 dealers handling this GENUINE HAIRY PERUVIAN ALFALFA SEED—sold behind the RED SEAL BRAND. Ask your dealer about RED SEAL HAIRY PERUVIAN ALFALFA SEED.

Straight "Man to Man" Talk---

Finally,—We farmers who are growing genuine Hairy Peruvian Alfalfa Seed know just as well as you farmers who plant alfalfa seed, that after a man has spent from twenty to fifty dollars per acre in preparing his land for seeding, expecting to have a field of fine and vigorous growing Hairy Peruvian Alfalfa, he does not wish to be disappointed in the end by getting mixed, substituted, low-grade or weedy seed for a planting that is supposed to remain for ten years or more.

Surely not, when he can get GENUINE HAIRY PERUVIAN ALFALFA SEED under the RED SEAL BRAND, at a price just enough above the substitutions and low grades to pay for the extra care in keeping it GENUINE and PURE. If anyone offers you "so-called Hairy Peruvian alfalfa seed" without the RED SEAL TRADE-MARK ask him why—just ask him if it is because he can make a little more profit on "so-called Hairy Peruvian" without the RED SEAL Trade Mark.

A SONG OF PRUNES

Throughout the drift of centuries, since first the world was young, The bards have tuned their lyres up and cleared their throats and sung Glad songs of fruits and flowers, of the orchard and the field, And puffed up nearly everything the soil has deigned to yield. And so I crave attention while your humble servant tunes His lyre to the topmost pitch and sings a song of Prunes.

O Prunes! Though thou art fit to grace the banquets of a king, Yet dost thou to the lowly board of humble peasants bring Thy pulpy fatness full of joy and flavors rich and deep.— O, is there aught on earth so rare and yet so good and—cheap! And could I twang a thousand harps through centuries of Junes My one and all triumphant theme would be a song of Prunes.

But O! the hide bound, sorry Prune, with visage pinched and lean, We meet in boarding house resorts, is not the sort I mean. Give me, instead, the puffy Prune, inflated with its juice, That makes strawberries and the like to me of little use. For did I own a thousand mouths and twice as many spoons I'd still employ them, every one, to get my fill of Prunes.

—Nixon Waterman.

LOVE AND HONEY

(Continued from last week.)

"You certainly have done a day's work," she smiled, "and I appreciate it very much, but what are your wages?"

A dark crimson mounted from his tanned throat to his brow and he stammered, "If you please, Miss, it was just a little neighborly help and your appreciation is quite compensation enough."

Alla could be very haughty when she chose and she chose now.

"I am in the habit of paying those who work for me but perhaps you would prefer settling with my uncle."

"Yes, I think that would be much the better way," he answered, and lifting his hat again dashed up the hill and out of sight.

Alla was vexed without knowing just why and when her Uncle came she ran out to the corral to greet him.

"Hello, Puss," he called. "Come to give me a call down for not sending your gardener?"

"Oh, but he did come," she said, "and he worked like a good one all day. You should see all that we have accomplished. But really, Uncle, he isn't at all the kind of a man you gave me to understand that he was."

Amazement was written large on Monroe's face as he exclaimed:

"Thunder only knows who's been digging for you today, Honey, but it sure wasn't Jeff Barnes 'cause he's off in town on a drunk; been gone a week and likely be gone another one."

She told of the day's experience as they walked to the house.

"Wore a broad brimmed Stetson and high boots and rode a fine bay horse."

"Well, you've been entertaining angels unawares that's all. That there was Ralph Manly, the forest ranger, and bless me if I know who the joke is on."

Alla above all things disliked to appear ridiculous and that was the light in which she saw herself whenever she recalled the incident, and she inconsistently resolved that someone should pay for her wounded vanity.

So it was that when some few days later Ralph Manly rode up and lightly dismounted beside the new hive her Uncle was constructing she paid no heed unless it were to put a little more energy into the sponge cake she was beating. Later when the two men came in for lunch, the ranger was greeted with the coolest of nods. By tacit consent the affair of the mistaken identity was left entirely alone by all.

"I rode this way, Mr. Monroe," said Manly, as they left the table, "to tell you that I have located one of those swarms that you lost last summer and I believe they have been doing well for themselves since they left, for there's a lot of them there. They located themselves in that old oak just beyond that big pine that the wind split last winter by the hill trail."

"Glad to hear it," answered his host. "I'm after all the runaways. I've got a swarm out here now that I surely would hate to lose. The prettiest little Italian queen you ever saw and they're all sure workers."

As Ralph was leaving he turned to Alla.

"I brought some maidenhair that I picked up along the way, I thought it would be just the thing to run over some of your rocks. It's young now and ought to take root easily."

"Thank you, but I don't believe I have room for it," she returned.

"Oh, yes, I found plenty of room," he responded lightly. "You see I have it already set out, and it looks as if it had always belonged there."

The next time he rode in he bore a wigglesome bundle, which proved to be a curly, roly-polly collie pup. As soon as he was released, he looked about in search of a kindred spirit. The fussy old red hen was busy by the wood pile unearthing choice tidbits for her family, and she seemed to strike his fancy. Straightway he went to investigate. The rebuff he met swept his puppyship entirely off his short fat legs, and sent him flying with loud cries for help straight into the lap of the young woman who was shelling peas on the step.

"With the donor's regards," called a laughing voice as Ralph turned the corner. Alla hardened her heart and hid a tiny smile by stooping to pick up the scattered pea pods.

"You really should chain your pets if you must insist on carrying them with you and not have them frightening other people's poultry and being a nuisance generally." Then she stalked into the house with what dignity she could considering the pup was tugging hard at her skirt and showing his courage by his vicious growls.

Imagine her surprise then when a short time later she emerged to find horse and rider gone and a very chastened puppy tied to the clothes post with a tag on its collar, reading "His name is Wags and he adores biscuits." What could one do with a man who ignored snubs and when his offerings were refused simply left them anyway and rode off?

Then other complications set in. The stage one evening deposited a smartly attired young man and certain hunting and fishing paraphernalia at the mail box, all of which finally found its way to Monroe Price's front door. Alla greeted him as "Perry" and introduced him to her Uncle as "Mr. Newton," an old acquaintance. Perry explained that he was on a vacation and in search of a place to camp. Whereupon Uncle Price with true Western hospitality invited him to camp right there, which he straightway proceeded to do.

That night Alla found herself wondering if Perry would be as easy to manage out here alone as he was back there where he was only one of a dozen boy admirers. The fact of his following her certainly spoke well for his persistency.

If Perry Newton brought his gun along to hunt he merely neglected it for it continued to lean in the corner by the fireplace while its owner spent blissful hours in the tame pursuit of green peas, new potatoes and hens that stole their nests. As for Ralph Manly he still dropped in at unexpected intervals, now bringing a string of trout or a root of some wild plant or vine, always some woodland treat. Perry let it be known at once that he personally did not take kindly to the ranger's visits but his contempt rolled away quite unremarked by its victim.

One day when Manly and Alla were on their knees together in the little rockery by the spring transplanting a clump of fern he had just brought in, Perry appeared bearing a bundle of trailing vines in his arms. His face was red and perspiring but he had the air of one who through striving has conquered.

"There, Alla," he announced, as he deposited his load at her feet, "I've

dug up enough of this vine to cover the whole thing. It seems to run well and we won't have to bother Mr. Manly about bringing any more stuff."

He glared upon his kneeling rival very fiercely but Ralph merely rose and with his foot gave the vines a shove away from Alla before she could touch them.

"Poison oak," he announced laconically, "and you'd better go and bathe in alcohol," turning to the crestfallen Newton.

Whether he failed to take the advice offered or whether the remedy failed will never be known, but within a couple of days his manly countenance was swollen beyond recognition and he gazed upon a world grown suddenly

New Lamp Burns 94% Air Beats Electric or Gas

A new oil lamp that gives an amazingly brilliant, soft, white light, even better than gas or electricity, has been tested by the U. S. Government and 35 leading universities and found to be superior to 10 ordinary oil lamps. It burns without odor, smoke or noise—no pumping up, is simple, clean, safe. Burns 94% air and 6% common kerosene (coal-oil).

The inventor, V. S. Johnson, 31 N. Fifth St., Portland, Ore., is offering to send a lamp on 10 days' FREE trial, or even to give one FREE to the first user in each locality who will help him introduce it. Write him today for full particulars. Also ask him to explain how you can get the agency, and without experience or money make \$250 to \$500 per month.

Save 1-2 on Fuel

CHEAPEST HEAT YOU CAN BUY

The Slevart Oil Burner burns either distillate or kerosene oil in cook stoves, heaters, furnaces, pasteurizers, boilers, prune dippers, dairy sterilizers, etc. Absolutely safe, odorless, very convenient and low priced. **MAKES HEAT AT HALF WHAT WOOD AND COAL COSTS.** Install it yourself. Write for circular and prices on different sizes. Address Slevart Oil Burner Co., 710 North Main St., Los Angeles.

BETTER GARDENS EASY TO KILL WEEDS AND MULCH THE SOIL

BARKER WEEDER, MULCHER AND CULTIVATOR

Don't do garden work the slow, back-breaking way. The BARKER makes the finest garden possible—quickly, easily. Simply push along rows (like lawn mowers) — blades revolving against underground knife destroy the weeds and in same operation break the crust into a level, porous, moisture-retaining mulch. Aerate soil. "Best Weed Killer Ever Used." Has leaf guards, also shovels for deeper cultivation. A boy can run it—do more and better work than 10 men with hoes.

Write for FREE BOOK. Illustrated book, postpaid, gives prices delivered to your station, contains valuable information on gardening, letters from users, etc. A card brings it. Write today.

PACKERS OF AIRLINE HONEY

There's more than good taste and good health in every carload of fruit that leaves our packing houses. There's a lesson: a lesson of vision, of cooperation, of achievement!

Thanks to the whole-hearted cooperation of more than 11,000 growers in California, the products packed and marketed by this association today are known and bought the nation over. So, in buying Sunsweet or Growers Brand Prunes and Apricots, you're getting more than fine fruit at a fair-square price. You're getting a cross-State message that's full of meaning.

The next time you buy prunes remember that! Remember that, of all the fruits for which the world pays tribute to California, none are more essential to your daily fare than prunes. For prunes are rich in body-building and body-regulating elements. They give your system something you can get in no other way.

Quick-to-use energy comes to you from their rich fruit sugar. Body tone comes to you from their tonic iron

and other mineral and "vitamine" elements. Nor should you forget that prunes provide a laxative from Nature's own pharmacy.

Here, in California, we should be doubly appreciative of the prune and what it means—not only to the agricultural prosperity of the State but to our own *health-prosperity*. For, aside from its work in putting the prune and apricot industry on a sound and stable footing, the California Prune and Apricot Growers Association has opened up new avenues of taste and health to the American public.

Living so close to the heart of this pruneland as they do, many Californians have discovered for themselves the flavor-and-health possibilities of prunes. Those who haven't [and even those who have] will find our Recipe Packet a revelation. It is full of flavor-and-economy surprises. It belongs in every farm kitchen. We'll see that it gets in yours—if you say so. Send for it today—it's free!

Don't forget—National Prune Week February 27th to March 4th

3862. Child's Romper.—Cut in 4 sizes: 1, 2, 3 and 4 years. A 2 year size requires 3 1/2 yards of 27 inch material. Price 10 cents.

PRICE OF ANY OF THE ABOVE PATTERNS 10 CENTS EACH

HOW TO ORDER PATTERNS

Write your name and address plainly in full, give correct number and size of each pattern you want, and send 10 cts. a coin or (1 or 2 cents) stamps for each numb. In order to furnish our readers with the very best NEW YORK styles, all patterns ordered are filled in NEW YORK. Do not expect patterns under Two Weeks from date of order.

CATALOGUE NOTICE

Send 12c in silver or stamps for our Up To Date Spring and Summer 1922 Catalogue, containing over 500 designs of Ladies', Misses' and Children's Patterns, a concise and comprehensive article on dressmaking, also some points for the needle (illustrating 30 of the various simple stitches) all valuable to the home dressmaker. Also colored plates.

PATTERN DEPARTMENT

California Cultivator Los Angeles

black through mere slits of eyes.

All things even poison oak end in time though, and the day came when he once more went forth to bask in the light of his lady's eyes. But he noted uncomfortably that that light too often suggested a highly amused smile.

So the days slipped past with the situation seemingly unchanged. Then nature with unbounded lavishness sent a succession of days each more beautiful than the succeeding. The earth seemed to pulsate and radiate with the very gladness of spring. By day the meadow larks poured forth their trills till one wondered that their little bodies could contain so much sheer joy. And by night the chorus of frogs from the willow lined stream drifted through the open windows.

Alla, digging among her new rose slips, rose as a series of barks sounded from behind the shed.

"Wags, you vagabond," she scolded, "what have you rounded up now?" If it's another skunk like the one you brought in last week I shall surely disown you."

As she turned the corner a low hum fell upon her ears. It was not a new sound to her for several times in the last week she had heard it and each time it was the signal for considerable activity on her Uncle's part. She looked toward the line of low white hives and there above and around the third from the end rose a whirling humming cloud.

"It's Uncle's pet Italian queen," she said half aloud, "and he won't be back here for hours. If I could only trail them," she mused and watched the swarm anxiously. A line of them, steadily growing thicker were flying to the north and following with her eye she found their destination. It was a dead limb of an old tree some five hundred feet distant. It ran out from the trunk about eight feet above the ground and near its end a clump of bees as large as her two fists had already collected.

Alla hesitated only a minute; she had seen her Uncle hive several and she believed she understood the method, besides she knew how disappointed he would be if his favorites escaped him.

Perry Newton had left an hour before in search of small game and Alla felt instinctively that he would have been of little use anyway as he seemed to have an aversion to making friends with her Uncle's winged pets.

The empty hives were in the shed, already prepared for her new occupants she knew. Hastily she exchanged her dress for her hiking suit and leggins, she drew her riding gauntlets over her hands and then from its nail in the shed took down her Uncle's hat and bee veil. The empty hive proved heavy and awkward to carry but she finally placed it on the newspapers she had spread directly beneath the swarm which by now were nearly settled. Then she filled a bucket from the spring and with a small spray pump took her stand to one side of the tree. Her hat developed a habit of falling over one eye but after a little trouble she succeeded in directing her spray aright and the movers with spirits very damp indeed signified their willingness to remain and get dry.

Now her Uncle would have simply grasped the limb and shaken its burden upon the papers where after a wild scrambling they would have made their way through the narrow opening of their new quarters and been content to start housekeeping. But the limb was too high for Alla so after some experiments she ran for a small box by the shed.

What happened followed so quickly that she never was quite sure how it came about. She had just mounted the box which she had hastily placed on the uneven ground when it tipped giddily and fell. As it fell she grasped the limb above and her weight suddenly thrown upon the already decayed wood sent it with a crash to the ground. The fall did not hurt her so much but the limb was across her shoulders and held her pinned fast face downward. An angry din arose on all sides of her. Everywhere she could see a seething mass of bees crawled. They covered her gloves, her veil and her blouse. Swarming bees are proverbially good natured but one is not supposed to trust in that enough to lie down upon them. Above the din came a shout that Alla recognized as coming from Perry.

"I'm coming," he called.

A sharp stab followed by two or three more on the back of her neck warned her that her bee outfit was far from bee proof. Then came steps running and Perry appeared on the scene. By twisting her head she could watch him and when within a few yards he hesitated and brushed feverishly at some tiny winged specks in the air.

"Oh, hurry, Perry," she called, "they are stinging me so."

More specks appeared about his head and waving his arms and hat wildly he turned and fled. Over his shoulder drifted back the words: "Just wait, I'm going for help."

A wave of sickness swept over her and the next she knew a mighty tug had lifted the heavy branch from her shoulders. Arms gathered her up and great strides hurried her out and away. The humming was growing fainter though she knew hundreds of the insects still covered her clothes. Then she was unceremoniously dumped into the brook and splashed and shaken. Finally regaining her feet and shaking the water from her hair end eyes she saw Ralph Manly rolling in the water, which seemed full of bees trying vainly to find something to cling to.

An hour later with dry clothes they were taking stock of damages. Almost miraculously it seemed Alla had escaped with a few stings upon her neck and shoulders, but the forest ranger seemed to have doubled in size. Alla had his face and hands wrapped in cloths wrung from cooling lotions and he was lying back in the rocker.

Despite the evidences of the strug-

TRY A SUN-SWEET SUNDAY

Doesn't it sound good?

It tastes better!

What is it? A generous serving of vanilla ice cream, entirely surrounded by rich, fruity Sun-Sweet prune syrup. It's as rich as chocolate with fruity flavor added.

Try it at home.

Ask the soda fountain man for a Sun-Sweet sundae.

gle he seemed a very happy young man for Alla was seated upon one arm of that chair and a hand very frequently carressed certain growing bumps among his crisp dark hair.

The front door opened and a voice from the kitchen begged:

"Alla, could you bandage these stings for me, they hurt deucedly and my eye's near shut?"

"Try a little mud on them, Perry," she advised, "they say it's very effective. There's a lot by the spring, just help yourself."

And continuing an interrupted conversation:

"We could build a little rockery at the ranger station, couldn't we?"

"Uh huh," blissfully, "and let's have a couple of swarms of bees."

HINTS FROM HOUSEKEEPERS

Cakes and Cookies from Washington

In the January 7 issue of the Cultivator I see someone wants a 7 egg recipe for sunshine cake. Here is one:

Sunshine Cake.—Whites of 7 eggs, yolks of 5 eggs, 1 cup granulated sugar, sifted well, 1/2 teaspoon cream of tartar, pinch salt, 3/4 cup flour sifted twice, 1 teaspoon orange extract. Beat whites very stiff, adding salt at first and cream of tartar when the whites begin to foam. Beat the yolks until very thick, add one-half the sugar and continue beating with the egg-beater. Fold rest of sugar into whites without beating and add the yolks in same way, then the flour, then extract. Bake in a large tube pan, ungreased, from 45 to 55 minutes in a moderate oven. The batter should rise to top of pan, brown, then sink slightly, wrinkling. Test by pressing on the top. When done no depression is left. Invert the pan on standard so it will cool evenly, and remove when cool by running a knife and then your hand around the cake. Frost with 2 yolks beaten with pulverized sugar, 1 tablespoon orange juice and a little grated rind, using enough sugar to make proper consistency.

I will also send two other recipes that never fail for me:

Mock Angel Food.—Set 1 cup milk into a basin of boiling water and heat to boiling point. Into a sifter put 1 level cup flour (no more), 1 cup sugar,

3 teaspoons baking powder (rounded), pinch salt and sift 4 times. Into this pour the cup of boiling milk and stir smooth, then add the well beaten whites of 2 eggs. Do not stir but fold them in carefully. Do not grease the pan. I use an individual loaf pan. Bake in moderate oven. Flavor icing with lemon.

Cookies with Raisin Filling

Beat to a cream 1 cup sugar and 1/2 cup shortening. Add 1/2 cup sweet milk, 1 beaten egg, 3 1/2 cups flour, 3 teaspoons baking powder.

Filling.—3/4 cup sugar, 1 tablespoon flour, 1 cup boiling water, 1 cup chopped raisins; cook until thick. Roll cookie dough very thin, cut, place in pan; put 1 teaspoon of filling on each, placing another cookie on top of each one; then bake. Delicious. I often use prunes instead of raisins. I cut these cookies with a "Baker's Cocoa" can.—M. B. G., Wellpinit, Wash.

Doughnuts

In answer to Subscriber, Livermore, I am sending my recipe for doughnuts that have been called good and inexpensive by many.

One egg, one cup white sugar, one cup sour milk, one-half teaspoon soda, a little salt, flour to make stiff enough to roll. I find so many good things in the household department and am glad to pass along anything I can to help others.—Mrs. H. E. B., Galt.

A HALF DOZEN TESTED RECIPES

Mrs. K. G., Ceres

I have long enjoyed the household department and "Hints from Housekeepers," and have learned many new conveniences through it. I have several good recipes I would like to share with the other readers. Among them is a good recipe for sunshine cake, which has never failed me. It calls for only 8 egg whites and 6 yolks, and makes a good sized cake.

Sunshine Cake.—Beat whites of 8 eggs till stiff and dry, add 1 1/2 cups sugar (common white granulated), and continue beating, then add yolks of 6 eggs beaten until thick and lemon colored, and one teaspoon lemon or orange extract. Cut and fold in 1 cup flour mixed and sifted with 1 teaspoon cream of tartar. Bake 50 minutes in moderate oven in angel cake pan.

Devil's Food Cake.—Cream one heaping tablespoon shortening with 1 cup sugar, add 2 eggs well beaten, add cocoa or chocolate, 3 tablespoons dissolved in 1/2 cup boiling water, and beat thoroughly. Add baking powder 1 teaspoon mixed and sifted in 1 cup flour. Dissolve 1/2 teaspoon soda in scant 1/2 cup boiling water, add pinch salt and 1 teaspoon vanilla and mix all thoroughly. The mixture will appear thin, but will be all right. Bake in layers. Fudge frosting is nice for this cake.

Cinnamon Apple.—Wash apples and cut in two, remove core (pare if desired), and place in baking pan with cut side up. For each apple of medium size use: 3 tablespoons sugar, 1 tablespoon flour, 1/4 teaspoon cinnamon, speck salt. Mix all well and sprinkle over the apples. Put bits of butter on apples also. Pour boiling hot water over all until it reaches half way on the apples, and bake in hot oven until tender. Serve with sauce left in pan after baking and whipped cream if desired.

Blushing Apple.—To each bright red apple, 1 teaspoon orange juice, 1 tablespoon sugar, 1/2 cup water. Scrub apples and remove cores, place in the boiling hot water to which sugar has been added and cook carefully (so they will not break or fall apart). Remove from liquid and carefully remove skin so the color remains on apple. Cook syrup in which apple was cooked, medium thick, add orange juice, and pour over apple. Serve with whipped cream.

Rabbit Stew.—Two tablespoons Crisco or fat for frying, 2 tablespoon flour, 1 rabbit, 2 tablespoons chopped onion, 1 teaspoon salt, 1/2 teaspoon pepper, pinch allspice and 1 tablespoon salt to soak. Skin and dress rabbit, if dark and bloodshot soak in strong salted water for an hour or longer to draw out blood. Cut 1 pieces for frying, roll each piece in flour, fry to a golden brown on both sides, sprinkle over seasonings and onions, cover with water and simmer for two hours.

Salmon Pudding.—One can salmon

flaked or boned, or the same quantity of fresh fish, 1 cup light bread crumbs, 2 eggs, well beaten, 2½ cups sweet milk, salt and pepper to taste; mix all and bake in hot oven 30 minutes.

HOUSEHOLD QUERIES
Value of Hand Knitting Machines

In answer to Subscriber, Visalia, in regard to hand knitting machine, I wish to say a neighbor of mine sent for one last October and so far has not been able to make it work. She has had advice and help from the neighbors, but in spite of trying very hard has not been able to knit the heel or toe of a sock. It certainly seems complicated to us, and I would advise anyone to get in touch with someone who actually has made it work before investing in one.—Regular Reader, Orange.

To Subscriber, Visalia, who inquires in regard to the hand knitting machine I would say "Don't!" So many disappointed buyers have written in to the Los Angeles Evening Express that Estelle Lawton Lindsay recently replied: "For the eleven dozenth time I reply that I do not know of anyone owning an auto-knitter who could demonstrate it to you." A neighbor of mine has one which, after many days and weeks of study and experimenting I believe she has learned to run successfully, but only because she was exceptionally plucky and felt she could not lose the \$100 she had paid for the machine and the wool. I should call it a very complicated machine and the earnings very small if the socks must be sold to the makers of the machine. This neighbor can now make a pair in 36 minutes. The machine does do first class work if one will spend the time and nerve force to conquer it. Hoping this may be of service.—Reader, Van Nuys.

STATE BULLETINS

The state printer has been busy with a series of very valuable bulletins now being sent out by the agricultural experiment station staff at Berkeley. One of the most timely is a revision of Bulletins 240 and 246, "Vine Pruning in California," by Bioletti. This is a 112 page bulletin, profusely illustrated, which, in addition to Professor Bioletti's clear way of giving his information, makes this bulletin of greatest value and it is especially timely.

Another needed line of information is given in "Walnut Culture in California" by L. D. Batchelor. It is Bulletin 332. This bulletin gives general review of the walnut industry, climatic requirements, soil requirements, water supply, then proceeds with description of varieties and cultural considerations. In fact, the bulletin is not closed until harvesting, bleaching, grading, packing and selling are fully treated.

Another bulletin of interest to grape growers is 331: "Phylloxera-Resistant Stocks" by Bioletti, Flossfeder and Way. This bulletin takes up history of phylloxera resistant stocks in general and especially in California. An outline is given of the experiment work and tables showing yields of cuttings of various stocks, also the relative bearing and sugar content of various combinations.

Another publication on grapes, Circular 229, "Cordon Pruning," by Bioletti. Professor Bioletti merely refers to the "head" system of pruning and then devotes practically all of the 16 pages of the circular to discussing varieties and conditions suited to cordon pruning.

Still another grape publication is Circular 231, "The Home Vineyard," by L. O. Bonnet. Professor Bonnet discusses uses of grapes, culture in California and then gives lists with qualifications for home vineyard. Preparation of ground for small vineyard and discussion of arbors is followed by treatment of young vines and full bearing vines.

Soil building in California is aided by two circulars, 110 and 111. Circular 110, "Green Manuring in California," by J. W. Nelson, has a fund of general information packed within its four pages. The other, Circular 111, "The Use of Lime and Gypsum on California Soils," also by Nelson, has eight pages.

A more pretentious circular is one of 72 pages, 227, "Plant Disease and Pest Control" by Horne and Essig.

The greater portion is given to discussion of host plants and fungus or insect pests, with description, and later enters into discussion of the various pests with recommended control measures, and the third section of the book is given entirely to formulas and materials.

Bulletin 336, "The Preparation of

ship of 1075, and markets a crop amounting annually to more than \$1,000,000. To this end, it has spent more than \$100,000 in setting up its sales force and in making the necessary arrangements to supply its markets.

The 1920 crop was particularly heavy, and came just at the time when

fornia give assurance of a particularly heavy crop next summer, with the result that, unless the exchange is put on a firm financial basis, independent selling will ruin the eastern market and, with it, the honey producers of California themselves.

Facing this fact, the exchange appealed to The First National Bank of

Irrigating Young Orange Grove in Casa Grande Valley, Arizona.
Note use of improved metal gates for distribution of water. Other gates permit of division of the stream into two or more furrows. Engraving used through courtesy of Standard Oil Bulletin.

Nicotine Dust as an Insecticide" is by Professor Ralph E. Smith. Prof. Smith has given most thorough study to nicotine dust during the past few years, and his publication is prepared and printed in order to make known the methods and results of the work to this date.

Bulletin 337 is "Some Factors of Dehydrator Efficiency." It is written by W. V. Cruess and Arthur W. Christie. It discusses investment required, cost of operation, fuel efficiency, air flow, air distribution, fans, trays, etc. An idea of the approach of the subject is given by the first of the summary and conclusion. "The cost of a dehydrator erected by the average fruit grower for operation during a season of only one or two months must be as low as is compatible with reasonable efficiency if it is to be profitable.

Bulletin 334, "Preliminary Volume Tables for Second Growth Redwood," by Donald Bruce, has brought within three pages a fund of information for the forester.

Circular 230 discusses "Testing Milk, Cream and Skimmilk for Butterfat," of value to every dairymen.

COOPERATIVE HONEY PRODUCERS

The honey producers of California are preparing to reorganize their cooperative exchange system and to put up a fight against certain middlemen and jobbers who are attempting to wreck the cooperative movement in California in so far as the production and sale of honey are concerned.

To bring this reorganization about ten meetings will be held within the next few weeks. These meetings will be at Modesto, Bishop, Selma, El Centro, Santa Ana, Ventura, Sacramento, Riverside, San Diego and Los Angeles. At these meetings consolidation of the reorganized locals, which constitute the exchange, is to be completed.

The importance of this reorganization lies in the fact that the California honey producers produce 80 per cent of the California crop and 55 per cent of all honey made in the United States. Within the last 20 months the exchange has shipped 210 cars of California honey (36,000 pounds to a car), or a total of 7,560,000 pounds.

The exchange has created sales organizations in every important market in the United States. It has only approximately 20 cars of honey left to move before the new crop begins to come in, and in the meantime it has created supply depots throughout the United States to supply the market as this honey can be absorbed. The exchange has a total member-

there was an over-supply of sugar in the world. The large crop of 1920 was followed by a small (40 car) crop in 1921, with the result that through exchange methods the 1920 crop was held over and is now being disposed of.

The necessity for reorganization lies in the fact that early rains in Cali-

Los Angeles for financial assistance, and that bank has agreed to do for the honey producers what it already is in the habit of doing for other cooperative producers and for the cotton growers of Imperial Valley, Arizona and New Mexico, this by advancing necessary credit to carry the crop (Continued on Page 119.)

Beautify
Your Home
with
Climbing Plants

MANY beautiful houses and public buildings have large bare walls that detract from the general beauty of the building itself and will not blend or harmonize with the general appearance of the grounds. There are many different varieties of the climbing plants, both evergreen and deciduous, that will cover these bare walls.

Some varieties of these deciduous climbing sorts are remarkable for their beautiful spring foliage and their brilliant fall covering, such as the Ampelopsis; while the Ivy in turn has its beautiful green foliage the year round. The Bigonias, Passion Vines, Jessamines are in general favor for their beautiful flowers. And nothing is more desirable than the Wistaria and Honeysuckle for both their scent and flowers.

731 Market Street, San Francisco, California

Sir Aaggie DeKol Mead

Bred in the richest Aaggie Acme-De Kol of Valley Mead cross, he should be one of the greatest young sires of the breed.

Five of his seven nearest dams average:

Butter	2 Years.....	2,040.97 Pounds
Milk	2 Years.....	41,547.20 Pounds
Butter	1 Year.....	1,130.66 Pounds
Milk	1 Year.....	23,096.60 Pounds

His seven nearest dams average:

Butter	7 Days.....	30.47 Pounds
Milk	7 Days.....	627.60 Pounds

His calves are just what we could expect from a long succession of great sires and dams, and in their present state of development fulfill every promise in the pedigree of their great sire.

Good business judgment will eventually prompt you to place at the head of your herd a bull of Aaggie Acme-De Kol of Valley Mead breeding.

The Shorthorn Opportunity of the Year

Annual Spring Sale California Shorthorn Breeders Assn.

University Farm, Davis, Calif.
Wednesday, Feb. 22, Stockmen's Week
100 BULLS 100

In selecting the 100 bulls the committee has kept in mind the type of bull most sought after by range operators. They are outstanding in size, quality, constitution, fleshing and bone. Furthermore a lot of them will be sold in lots of five to a full carload, thus making it possible for buyers to fill their needs at their own price. A few bulls are included that can fill the bill as herd headers. Some are straight Scotch, others are Scotch topped.

Remember: The Better the Bull—the Better the Steers

20 Choice Females 20

The farmer or breeder in search for foundation females will find among the 20 head, cows and heifers of correct breeding and type. Why not start a small herd now?

The consignments have been drawn from the best herds in California. Every animal guaranteed a breeder.

RANCH

We have assembled an excellent foundation herd of females and will be glad to have breeders call. Fred Hartsook, Lankershim, California.

Your appreciation of the California Cultivator can be shown best by writing to and buying from Cultivator advertisers.

What Kind of Cows Do You Own?

IN the promotion of the pure bred dairy cow campaign now being waged in Humboldt County, several facts have been brought to light that go far toward making clear some of the reasons why many of our dairymen are not overly enthusiastic about their business.

In a preliminary survey made in that county—one of the leading dairy counties in the United States—it was found that about 28,000 dairy cows, so our information has it, were maintained.

By checking over the disbursements of the creameries, condensaries and cheese factories it was developed that the best 14,000 cows returned their owners \$700,000 more than the other 14,000 cows—\$50 more per cow.

Further inquiry disclosed that the reason for the difference was directly due to the top half better bred cows along with better management.

With such conditions prevailing in progressive Humboldt County it is not too much to expect that similar conditions obtain in other California communities. Now if it is true that one half of our cows produce \$50 worth of products more than the other half some idea of the economic loss chargeable to inferior cows can be obtained by multiplying 250,000, half the producing dairy cows in California according to the 1920 census, by \$50. The result is \$12,500,000. Twelve and a half millions is quite a sum and if available would go far toward making dairying more attractive.

But is it possible for California dairymen to add \$12,500,000 to their yearly incomes? It is—and more too. But in the end it is a problem for individual dairymen and dairy communities to solve. Legislation can not turn the trick; the various farm organizations can do little; the different producers associations can not go very far. First of all, cow owners somehow must learn that the business of dairying in the main, is not essentially different from production in other lines; that net profits bear a direct relation to the ability displayed by the manager and that the place to begin making dairy profits is at the producing end and not at the selling end. The selling end is important enough but efficient marketing is dependent on efficient production. Efficient production is dependent upon efficient cows and efficient cows can only come from well

bred bulls. There has been rather too much stress laid on selling dairy products and too little on economical production; too much railing at the middleman and not enough support given cow testing associations; too many meetings given over to relating mutual hard luck stories and not enough meetings to urging better bulls. As a consequence many dairymen have been led to expect that their business is about to be made profitable through the payment of some membership fee. That is a false notion that needs to be laid aside. The business of dairying is not going to be universally profitable until there is a cow testing association organized in every dairy community and the unprofitable cows eliminated from the herds of this state and well bred bulls placed at the head of such herds. Once a herd or dairy community gets organized on such a basis a point is reached from which definite progress can be made.

Some men waste enough time milking scrub cows that they are lucky to be outside of the poorhouse, according to E. M. Harmon, dairy extension specialist for the Missouri college of agriculture. Few of us realize the tremendous amount of time and effort lost in feeding and milking the scrub cow. Missouri cow testing associations are throwing some interesting side lights on this subject.

For instance they found last year that the cow that averaged 100 pounds of fat per year produced only 0.38 pounds of butter fat and 9 pounds of milk for each milking day. The cows that averaged 200 pounds of fat per year averaged 0.68 pounds of butterfat and 15 pounds of milk for each milking day. Those that averaged 400 pounds of fat per year produced 1.33 pounds of butter fat and 25.1 pounds of milk per milking day. In other words one man got 38 pounds of butterfat and 900 pounds of milk per cow for each 100 days milking while his neighbor got 133 pounds of butter fat and 2,500 pounds of milk for the same number of days' work. This does not take into account the fact that the feed cost of producing butterfat in the low producing cow was 37.3 cents per pound while the good cow produced it at 17.3 cents per pound.

Is it any wonder that some men can own cars and build modern homes while others cannot? The cow testing associations are building up production and profits. They constitute a powerful factor for benefiting the dairy farmer.

Everything Bettering

By A. L. Spellmeyer

CONFIDENCE is returning. The first people to be hurt in this nation by hard times, the producers, are the first to receive a little relief. Indications abound that we are either emerging from depression or else riding a wave of temporary revival. Its permanence will be decided by the sincerity of the financial and governmental relief policies now started. The country has been rich, is rich, and there has been no reason for the past depression, forced entirely upon production, other than greed of middle marketers, the attitude of finance, and the general state of mental chaos that it all brought about, making the soundest of staples sell for a song.

Better conditions are indicated in many ways. Prices on beef to California men bettered a cent. Seven cents strong rules for good steers, possibly eight cents soon. Lambs took a raise. Carcass meat prices of beef steers and cows advanced a cent and may be up another cent by the time this is out. Lamb carcass advanced. Hogs advanced a half a cent live weight. Steers, dressed, are now 13½ and may go to 16 cents.

At the same time there is no raise in the retail trade in bulk instances. They have plenty of margin in the 96 per cent gross they are making retail in some shops.

Hides are stronger, tallow is better than its lowest price, wool is better

than its lowest, but best of all is the better attitude in men's minds.

Money is cheaper, banks are no foreclosing, the year has brought rain and grass to the Southwest, the national government is taking steps to safeguard basic agriculture, the ranges have advanced holding price for steers and stock cattle until yearling steer is worth \$25. Feeder steers have advanced a strong cent in two weeks per pound; 5.50 cents California is offered freely for big steers with a possible six cents for something extra good. This alone means \$10 a head on steers.

Best of all, the attitude of a mutual plan seems to have developed in national livestock circles, with meat councils and a cooperation between packers and producers that has heretofore been impossible. There is a lot ahead to do and we are not yet the clover nor out of the rough, but everything seems to show we are on our way to normal rather than stagnating down.

Building material on a pre-war basis has been 90 per cent up, retail meat has been 42 per cent up, and cattle producers two per cent down. If the country is resuming a normal view there is every indication that things are going to settle around 30 per cent over 1913. If this should come would mean a decline in building materials, a decline in retail meat and considerable advance to producers. would mean cheaper rents and housing and more for one's money.

Other indications of better times are activity in copper and metals, probable resumption of work in mines, and a healthier demand for country property than has been seen for two years in California. Ranches and country property show activity, as they have gone to rock bottom valuations in the hard stress period.

WAR WITH CATTLE TICKS

In Georgia, where cattle ticks are fighting a losing battle with federal, state and local government authorities, there are 3,291 dipping vats in which cattle are immersed every 14 days. Dipping began early in the spring, the time when the most effective results in tick eradication are obtained. During March approximately half a million cattle splashed through the dipping vats in the state. The April reports show that 833,434 cattle were dipped under federal, state and county supervision.

Now all cattle that have been dipped in Georgia are marked with paint, and this plan has given very satisfactory results in getting to the dipping vats animals pastured on the open range that might otherwise miss regular dipping. The use of range riders, whose duty it is to search for and dip cattle that are not marked, was considerably increased during the spring.

In Georgia, as in all other Southern states where the fight against cattle tick has been waged, there has been more or less opposition to the tick eradication movement, but there are also many who fully appreciate the present campaign and who throw all their weight into the scale in its favor, and one farmer actually wrote to the department quite lately as follows: "In our part of the state, no man, no matter how unreasoning and bitter his opposition to tick eradication when we needed his moral support, can now be found who does not fully approve the work. No argument should carry more weight than the full indorsement and approval of opponents when they see the whole truth and change from opposition to advocacy."

SLAUGHTERING ONLY ONE HOG

The old fashioned scalding barrel is still recommended as being efficient if only one hog is to be slaughtered on the farm, according to animal husbandry specialists at South Dakota state college. A galvanized iron watering tank is better when a number of hogs are to be slaughtered. A fire pit can be dug under the tank, bringing the top of the tank level with the scraping board. The water should be heated to 140 to 150 degrees Fahrenheit. Cautic soda, wood ashes or lime help remove the scurf. The hogs should not be killed until the water is ready.

The carcass should be placed in the scalding tank as soon as the hog is dead, being sure to keep head and feet under water. The hog should be rolled frequently in the tank or turned in case a barrel is used. This insures a uniform scald. When the hair slips from head and feet the carcass can be removed from the water. The scraping must be done rapidly and the head and feet should be cleaned first. Scraping disks, blunt knives, corn knives or hoes may be used.

TOOLS USED IN BUTCHERING

The season is now at hand when many ranchers will take advantage of the cool weather and cut down the cost of meat for the household by butchering some of their own animals.

In order to do a satisfactory job of butchering, the California department of agriculture suggests the following simple tools in order that the work may be done efficiently: One sticking knife about six inches long, one curved six inch skinning knife, a steel, an ax, a pritch, a meat saw and a candlestick scraper. These are all the tools required in butchering, but for slicing steaks after the carcass is cut into the various pieces it is convenient to have a steak knife about 14 inches long and a cleaver.

When the animal has been slaughtered and the carcass dressed, cut up and the pieces stored away, there is one more step which should never be overlooked, viz.: clean and dry your tools and put them away where they will not rust. By so doing preparations for butchering another animal some time in the future can be made quite readily.—Dr. S. O'Toole.

HOW TESTING COWS PAYS

Two years ago a small Jersey breeder became interested in cow testing during the Missouri state fair cow race. He decided to see what his cows would do if placed on test. He went home and started to prepare his cows for R. of M. test. "As a result," says A. C. Ragsdale of the Missouri college of agriculture, "Edgar Hart of Ulrich not only discovered that he had some mighty fine cows, but one of them, Celeste's Golden Glee, a senior yearling, has broken the state record in her class by almost 30 pounds of fat, producing 8,096.8 pounds of milk and 473.67 pounds of fat."

It is a great achievement for a breeder to break a state record in Missouri, but it is even greater to do it the first year of testing, especially when the cows are milked only twice a day. The excuse about needing expensive buildings and equipment before a breeder starts testing has again been shown up. It doesn't hold water. One only needs well bred cows coupled with intelligent feeding and milking.

Did it pay Edgar Hart to test? He has only a small herd and ran only five cows on test. The total amount paid for testing was \$185.15 for 14 months' supervision. There are incidental expenses in addition, such as board and room for tester for about 35 days and time required in transporting him. In return for this Hart was enabled to break one state record with a heifer that has her productive life before her, increasing her value and that of her future offspring. Another cow, Grace Popular Girl, will produce over 650 pounds of fat as a senior three year old, winning second place in her class. Another, Susie's Golden Rosette, at three years produced approximately 530 pounds of fat. Then two aged cows, Coomassie's Golden Celeste and Rosalpa Eminence will each make considerably over 400 pounds of fat.

Mr. Hart did not know what he had in his herd until he went prospecting among his cows. Give your cows a trial and the results will be equally gratifying.

SHORT COURSES IN DAIRY MANUFACTURES

The college of agriculture of the University of California is offering a new form of instruction this year for experienced butter makers, cheese makers, and milk plant operators, for ten days beginning February 6. The instruction will include three lectures each day by members of the dairy industry division, three hours' practice work in the commercial plant under the direction of an instructor, and two hours devoted to discussions of commercial manufacturing problems. Outside speakers, men connected with commercial manufacturing work, will be secured to lead the discussions.

These courses are planned to meet the needs of men now employed in dairy manufacturing plants to study some of the later developments in dairy manufacturing and milk plant operations and to meet with men engaged in the same line of work for their mutual benefit.

Detailed information may be secured from the short course announcement or by writing Dairy Industry Division, University Farm, Davis. Applications should be mailed in advance to the dean's office, University Farm, Davis.

SUNFLOWERS FOR SILAGE

The developments of the last three years have brought the sunflower to the front as one of the most satisfactory crops that can be grown for silage purposes, says Prof. G. H. Hut-ton in the Agricultural Gazette of Canada. "From the experience I have had with the crop, I am satisfied that it will be developed until it is one of the main forage crops in the West, and because of its adaptability to a wide variety of conditions, such as drouth, its suitability for irrigation, its resistance to frost, and its high feed value, it will mean millions of dollars of increased wealth to the stock growers of this country."

Cow Comfort Means Milk Dollars

Have you ever stopped to consider that every penny you invest in making your cows more comfortable brings you back dollars in extra profits on account of increased milk yield?

And cow comfort is only one of the advantages Star Barn Equipment offers. Every day you delay modernizing your barn by installing Star conveniences is costing you money—no matter how few or how many cows you own.

United States patents protect the exclusive features that put Star Barn Equipment in a class by itself—you will find these advantages in no other brand. For instance, the Unit System which enables you to add stalls as your herd grows—the Star Alignment Device which keeps

bedding and stalls clean and lessens labor—the Star Curb Clamp which cuts down installation cost—these and many other features you wouldn't be without are exclusive with Star.

In the Star Line, you'll find more than merely Steel Stalls and Stanchions—everything for the barn, inside and out, is there: Water Bowls, Pens, Ventilation Systems, Litter and Feed Carriers as well as Harvester Hay Tools, Cannon Ball Door Hangers, Hoghouse Equipment, Garage Door Fixtures and a world of other farm specialties.

Our 348-page bound catalog, profusely illustrated in colors, is free if you'll write for it and tell us when you're going to build a new barn or remodel your old one. Our Plan Department is at your service, free. Use the coupon for plans. Write for the catalog.

Herd Bulls

Harris Standard 2d

Beau Blanchard 76

Nevada Hereford Ranch

J. H. Cazier & Sons
Wells, Nevada

A government accredited herd. No reactor in 16 years. A herd whose record in the show and sale ring is only surpassed by the esteem accorded its productions by cattlemen. We can furnish bulls or females to fill any need—and at sound prices. Visit our herd or write for information.

DIAMOND G HEREFORDS

I now offer 10 extra good open registered heifers, at real bargain price, sired by a son of an International Champion. Start your herd with these.

H. H. Gable

Esparto, Cal.

Mission Herefords

One of the good herds of the State. Headed by The Peer, a son of Beau Blanchard. Young stock for sale from time to time. Visitors welcome and correspondence invited. JOHN A. BUNTING
Mission San Jose Calif.

HEREFORD BULLS

IN CARLOAD LOTS

AT PUBLIC AUCTION

Tuesday, February 21, at 1 P.M.
University Farm, Davis, Calif.

This sale affords the first opportunity in California for buyers of range bulls to buy them in groups suitable for the carload buyer.

There will also be at least 20 bulls sold individually, to take care of the buyer who wants only one or a few head. There will also be about 25 cows and heifers of good breeding for the man who wants to increase his she stuff.

Every Animal Registered,
Transferred Free of Charge,
Guaranteed a Breeder, and Tuberculin Tested.

These choice registered Herefords are consigned by fifteen leading Pacific Coast breeders under auspices of

Pacific Coast Hereford Cattle Breeders Association

J. I. Cazier, Pres., Wells, Nev.
J. A. Bunting, Sec.

Herd Sires:

California Model 635776

Imp. Braywood Collynie 951409

California's latest triumph, the winning of Grand Championship over all breeds in the fat classes at the Chicago International by Lulu Mayflower, sired by Sultan Mayflower, the sire of our senior herd bull, California Model, maintains the reputation won in 1916 by California Favorite, the Grand Champion steer at the same show, whose dam, Glenbrook's Marvel, is the dam of our California Model. Such honors prove the worth of the breeding of California Model.

Durocs

January 26, Greenwood Farm, Live Oak.

February 8, California Duroc-Jersey Breeders' Association, University Farm, Davis.

February 9, June Acres Stock Farm, Davis.

February 16, Sierra Vista Stock Ranch, Perris.

Poland Chinas

February 24, California Poland China Breeders' Association, University Farm, Davis.

At the annual meeting of the American National Livestock Association held at Colorado Springs, January 12-14, Fred Bixby of Long Beach, one of the largest range operators in California and past president of the California Cattlemen's Association, was elected president of the national association. Mr. Bixby is the second Californian to be honored with that high place, H. A. Jastro of Bakersfield having served several years ago.

At the Ogden Livestock Show held early this month J. I. Cazier & Sons of Wells, Nevada, had the grand champion Hereford female in their junior yearling heifer Standard Eyes 4th. This heifer was junior champion at the 1921 California state fair. The same herd furnished the junior champion bull in Beau Blanchard 4th and won first on senior heifer calf, and on their calf herd. Practically their entire showing was the get of their herd sire, Beau Blanchard 76th.

Twenty-two Jersey bulls were sold January 11 to dairymen of Humboldt County as a result of the pure bred bull campaign initiated by Farm Adviser Dr. J. W. Logan, California Dairy Council and the California Jersey Breeders' Association. Most of the bulls came from herds in the San Joaquin Valley. They sold at prices ranging from \$120 to \$300.

Eighty head of Herefords, consisting of 55 bulls and 23 females, have been entered with C. L. Hughes, sales manager for the Pacific Coast Hereford Cattle Breeders' Association sale during Stockmen's Week at the university farm. The cattle have been selected from 12 herds in California, Oregon and Nevada and represent the following breeders: H. A. Baldwin, Pleasanton; H. M. Barngrover, Stockton; Roland Bass, Standish; H. H. Gable, Esparto; W. J. Bemmerly, Woodland; John A. Bunting, Mission San Jose; G. W. Harwood & Sons, Milford; University of California; William Briggs & Son, Dixon. Oregon breeders are: J. B. McNeerney, Carlton, and A. H. Barnum, Moro. Ed T. Morgan, Northam, is the only contributor from the Silver state.

The opening Hereford sale of the year was held in Nebraska by Mousel Bros. and indicated a strong demand for cattle of quality. Fifty-five head made a general average of \$533. The top of the sale was \$1,425.

Aralia De Kol Mead 2d, that made 36.53 pounds butter in seven days after she calved last December, has now increased her record in the A. W. Morris & Sons Corporation herd at Woodland. Her December record was made in her first seven days and she was taken off official but continued on semi-official. When her January semi-official test was made she was going so strong that she was again continued on official test and up to the present has 37.12 pounds butter from 563.7 pounds milk for her best seven days. Another good young cow in the Morris herd, Flossie De Kol of Nevada, has 32.57 pounds butter from 625.2 pounds milk to her credit in seven days and shows promise of increase.

The largest herd of registered Holsteins in California at present is the one owned by Frank M. Helm, Fresno,

with over 400 head of registered females. More remarkable than its size, however, are the facts that there are practically no old cows in the herd, and that outside of about 25 daughters of the noted sire, Sir Veeman Korn-dyke Pontiac, practically all the females are granddaughters of King Mead of Riverside and Prince Gelsche Walker, presenting a uniformity of popular breeding seldom found even in a smaller herd. As official testing progresses some very substantial records are being made. The latest three heifers to go on test are Helm Bessie Walker, a junior four year old granddaughter of Prince Gelsche Walker, that made 27.42 pounds butter from 540.9 pounds milk in seven days; Helm Lady Korndyke Walker, a first calf junior three year old granddaughter of Prince Gelsche Walker, that made 22.46 pounds butter from 490.8 pounds milk in seven days; and Rosina Creamcup Mead, a senior two year old granddaughter of King Mead of Riverside, that made 19.42 pounds butter from 428.6 pounds milk in seven days.

UNIVERSITY PLANS GREAT LIVESTOCK MEETING

(Continued from Page 95.)

The institution controls more than 3,500 acres of deeded land and 20,000 acres of forest reserve. Several hundred head of breeding cows are maintained under practical range methods and through the use of well bred bulls the possibilities of working cattle improvement is being demonstrated. This work is of fundamental and far reaching importance to the cattle industry of this state and is being closely followed by all progressive cattlemen. A. E. Lawson, western representative of the American Shorthorn Association, will tell of the progress the breed is making in the West. The afternoon is set aside for the association's annual spring sale, which, as with the Herefords, will feature bulls for the range men and which will be offered in lots instead of individually.

The annual banquet for all livestock interests will occur Wednesday evening. Nearly every item on the menu will be contributed from the fields, herds and flocks of the university. It is planned to serve cuts from the steer and heifer used in the cutting demonstration. In this connection it will be of interest to know that the heifer to be slaughtered is a half sister to Lulu Mayflower, the heifer that won grand championship honors at the recent International Livestock Show and is probably the most aristocratic beef ever served in California.

In point of varied activities Thursday is the big day. On this day the swine interests, the dairy interests and the sheep interests will hold forth. The California Swine Breeders' Association will meet at nine o'clock, and President J. I. Thompson, formerly in charge of the swine work at the university farm, will offer a development plan for the association. Roy M. Filcher will outline a program for extending the farm bureau auction plan of selling. E. C. Good, manager of one of the large packing plants, will give an analysis of the market situation in this state. It is reasonably certain that E. Z. Russell of the United States department of agriculture and one of the best known swine men of this country will be present and address the hogmen. Professor E. H. Hughes will make public the results from a series of feeding tests carried on to determine the feeding value of rice and rice products. The California Poland China Breeders' sale will be held during the afternoon.

The California Wool Growers' Association will meet Thursday forenoon in business session after which A. T. Spencer will lead a discussion relating to the development of the spring lamb trade in this state. Fred A. Ellenwood, president of the association, will report the recent meeting of the National Wool Growers' Association and will outline a plan for the reorganization of the local body along the lines of the cattlemen's association. Professors Miller and Wilson are preparing several additional features.

The dairy session on Thursday opens with a discussion of sunflower silage. The university has been conducting extensive feeding trials with this new silage crop and the results to be reported promise to be of wide

interest. The afternoon will be occupied with business meetings of the state associations of Jersey, Guernsey and Ayrshire breeders. The feature of the Thursday meeting will be the announcement of the closing of the state dairy cow competition which has been in operation for the past 14 months. The results will be given at the evening meeting and will be followed by addresses by B. H. Rawl, formerly chief of the dairy division of the United States bureau of animal industry; Sam H. Greene of the California Dairy Council and Professor F. W. Woll, who has been in charge of the competition. Professor Gordon H. True will present the numerous prizes to the winners.

The dairy session will be extended over Friday. The owners of the winning herds will tell how their cows were fed and handled. Noel Negley, formerly with the United States department of agriculture, will explain the practical results of cow testing association work and offer suggestions as to how dairymen should use such associations. J. W. Coppini of Fernald, one of the most successful dairymen in California, will show the practical value of well bred bulls in increasing herd production. Professor Woll will tell of the state register of production for grade cows. This is a new project in this state and provides the machinery for owners of grade cows to secure state certification of production. Dr. G. H. Hart will address the dairymen on the important problem of contagious abortion. Following luncheon there will be held a sale of dairy bulls of the different breeds that have been selected from high producing dams. This sale will provide a splendid opportunity for dairymen to select bulls to improve their herds.

In addition to the above program special consideration will be extended the horse interests and present plans include an endurance contest for horses of suitable type for army remounts. A program for breeders of milk goats is also being arranged.

Every California farmer and livestock man is invited to attend Stockmen's Week. Men who have attended in former years testify to the value of this event and men who have never attended should make a special point to be present and become acquainted with what the university is trying to do for the promotion of better livestock in this state. No man can fail to be impressed. The university has done its part and the success of the approaching meeting will be measured entirely by the support of the men and women it seeks to serve.

PETER IVERSEN OF HUMBOLDT COUNTY WINS CULTIVATOR PRIZE

By Prof. F. W. Woll

Five grade cows owned by Peter Iversen of Grizzly Bluff had the highest average production of butter fat of similar groups in herds entered in the state dairy cow competition during the month of December, viz., 48.62 pounds, and the California Cultivator prize for that month was accordingly awarded to him. The productions of the individual grades for the month were as follows:

	Days			Butter	
	Age in	Milk		—Fat—	
	Yrs.	Milk.	Lbs.	%	Lbs.
Holst'n hfr., gr. H..	3	191	784	6.9	54.10
Poor, gr. J.....	4	241	698	7.1	49.56
Holstein, gr. H.....	4	271	698	7.0	48.86
Old Jersey, gr. J.....	M	275	679	7.0	47.53
Red, gr. Sh.....	M	270	673	6.4	43.07
Averages.....		250	706.4	6.88	48.62

It will be noted that three of the prize winning grades were young cows and that all were far advanced in their lactation, viz., 191-275 days from freshening at the beginning of the month. Their production of butter fat ranged from 43.27 to 54.10 pounds, their average production of milk being 706.4 pounds, with an average fat content of 6.88 per cent. These cows stood first among similar groups of five grades in 13 dairy herds in different parts of the state, that competed for the Cultivator prize in the past

Tosantos Herd

Bulls for Breeders and Dairymen. All our milking females have A. R. O. records. Every calf is out of an A. R. C. dam. All our milking females are on long time test. Only one bull of service left.

E. D. Barry, Jr. Covina, Calif.
Workman and Azusa Ave.

month. The average production of only one other group came above 40 pounds butter fat, viz., that owned by M. L. Pontoni, Arcata (45.64 pounds). The production for the other grades ranged between 15.6 and 48.62 pounds fat.

As previously announced the competition will close on the 31st instant, after having been in progress since September 1, 1920, a period of 16 months. The awards of the prizes offered will be announced and the presentation of cash prizes and silver trophies, etc., will take place at the evening session, February 23, of the Dairy Farmers' Conference, during Stockmen's Week held at the university farm, Davis. Farmers and breeders who have participated in the competition, as well as donors of prizes in the competition and the general public, are cordially invited to be present at this and other sessions of the conference. An excellent program with addresses and discussions

First Dairy Cattle Judging Team to Represent U. C.

This team entered the judging contest at the Pacific International Livestock Exposition, Portland, Oregon, in November, winning second place in the contest, and was high team in Jersey cattle contest, also furnishing the highest man. Front row, left to right, B. H. Thomas, L. A. Pellissier and N. D. Hudson. Standing, W. E. Tomson, coach.

by leading dairy authorities will be offered at the conference, insuring all dairy farmers who attend a highly interesting and profitable meeting. The same also holds true as regards all who attend the meetings of the stockmen during the entire week. University farm, Davis, will be the Mecca of California livestock men and dairy farmers during the last week of February.

The December report of the competition is the last monthly that will be issued. The compilation of records made in the competition is not likely to be completed before the Davis meeting and the list of prize winners will be made public through the press at that time. It is planned to give the history, main results and teachings of the competition in a bulletin of the college of agriculture to be published as promptly as practicable on the completion of the competition.

EXCESSIVE FILLING BEFORE SHIPPING

Reports to the effect that excessive shrinkage on livestock at central markets is frequently experienced are sometimes received from members and managers of cooperative livestock shipping associations by the United States department of agriculture. In some cases these reports take the form of complaints, and at times the shrinkage feature is pointed to as a weakness in the whole system of cooperative shipping.

While many things can, and frequently do, result in excessive shrinkage in livestock, investigations have shown that at times it is at least partly due to a disposition on the part of some shippers to overfill their stock before loading. This custom seems to be a relic from the days before cooperative shipping came into vogue and when most small producers sold their stock to country buyers. Under the system of marketing wherein livestock

was usually sold on the basis of home weights or shipping point weights, it was usually to the producer's advantage to obtain a generous "fill" on his stock before turning it over to the country drover.

The cooperative system of shipping livestock, however, practically eliminates the incentive to excessive home or shipping point fills. Stock that is fed heavily just before loading is not only quite likely to sicken and sometimes die while in transit, but seldom takes a good fill when it arrives at market. Furthermore, where cooperative shipments are graded at the shipping point the man whose stock has been given a heavy fill receives more than his just proportion of the net returns. Home grading of cooperative shipments is, in most instances, highly desirable, but it can be successful only where the individual members "play fair" with each other or, in other words, where they really cooperate.

NEARLY DOUBLED PROFITS

The opportunity that awaits the average dairyman in establishing a high class dairy herd is well illustrated in St. Louis County, Missouri, according to E. M. Harmon of the agricultural extension service. The first man to signify his willingness to join the proposed cow testing association in 1919 was Jno. L. Boland of Webster Groves. He not only joined but spent a great deal of time and effort in putting the association across.

After the association got started he found that his herd ranked uncomfortably close to the bottom in actual production. The feeds used and methods practiced were the best so Mr. Boland knew there was no hope of making those cows profitable. His next move was to begin to buy a herd of high class young purebred Holstein cows and to eliminate the grades and inferior cows which he had on hand. The following figures best tell the story of the improvement accomplished:

During the first year of the association's work, Boland's herd produced 3293 pounds of milk and 161.6 pounds of fat per cow, and made a profit of \$67.48 per cow above cost of feed. In the second year Boland increased his herd averages to 7528 pounds of milk and 265.7 pounds of fat, and had increased his profit above feed cost to \$112.21 per cow. He had increased his production of milk 128 per cent, of fat 64 per cent and his profits 65 per cent.

These figures speak for themselves and are worth thinking about. If all of the dairymen in Missouri were as eager to build up their herds, dairying would soon become far more profitable than it is at present.

Third Annual Consignment Sale of the

California Duroc-Jersey Breeders Association

University Farm, Davis, Feb. 8

Again the California Duroc Breeders offer to the farmers and the new breeders this great opportunity to buy at public sale sows and gilts selected from among the tops of the leading herds of California and bred to the greatest boars on the Coast.

Durocs Are the Leading Breed of Hogs in America

because

1. The sows raise larger litters and are remarkable mothers.
2. They are hardy and great rustlers.
3. They are unsurpassed as economical feeders.
4. They have a gentle disposition.
5. They have a carcass that fills the modern demand of the butcher.
6. They thrive under ordinary farm conditions.

Their superiority is proven by the fact that there are more Durocs than any other breed, and half of the hogs marketed in the United States have a preponderance of Duroc blood. They are the farmers' favorite because they produce the profits.

This sale offers sows sired by and bred to such boars as Choice Wonder 3rd, Ace of Pathfinders, Lord's Orion Cherry King, California Orion King, June Acres Pathfinder, Western Chief, High Pathfinder, Mammoth Sensation, Jr., Key of Giant, Dreadnaught Sensation, Experimental Defender, Falfadale's Sensation, Johnson's Defender Jr., King Orion Cherry, Western Pathfinder, California Golden Orion King. State Fair prize winners are included in the offering.

This is a breed promotion sale, designed to give an opportunity to farmers and breeders to select from the best that the leading herds have to offer. If you want to make pork production more profitable you will find sows in this sale that will fill your needs and fit your purse. If you want to improve a good breeding herd here is where you will find sows that will do it. DON'T MISS THIS SALE.

MARKET YOUR CROPS THROUGH HOGS

You can get more money for your crops through good hogs than any other way. Hog prices are strong and there is a real shortage in the state. There never has been a better time to make a start with one or more good bred sows or gilts. The offspring from one sow will soon grow to a herd.

June Acres Stock Farm Annual Sale 35 Duroc-Jersey Bred Sows and Gilts Davis, Calif., Thursday, Feb. 9

This is one of the oldest herds in the state. During the past five years June Acres Durocs have been among the heaviest winners at the state fair—including the grand champion boar 1920, Choice Wonder 3d. Most of the offering will be sired by him or bred to him. The balance will be bred to a son of the mighty Pathfinder. Farmers and breeders can look to this offering to secure reliable, dependable stock of modern type and correct breeding. Every lot guaranteed a breeder.

SALE WILL OPEN AT 1:30 P.M.

Pumps for Small Plants

Where the source of water supply is a stream or surface body of water, the choice is usually between a power pump and a centrifugal pump and will depend largely on the lift and capacity. Power pumps are best adapted to high heads above 75 feet and to small or moderate volumes of water, usually under 200 gallons per minute. For these conditions the efficiency of a power pump is usually greater than that of a centrifugal pump. For greater volumes the plunger pumps are comparatively expensive and centrifugal pumps are usually preferable unless the lift is excessive. The centrifugal pump has the advantage that it is simple in construction, with no parts to get out of order, and that it is cheaper than a power pump.

Where the source of water supply is ground water with the water table in the well at a depth below the surface not much greater or less than the limit of suction lift, so that a deep pit is not necessary, then the choice is between a centrifugal pump, a power pump and an air lift pump. The selection between the centrifugal and power pump will depend on a consideration of lift and capacity as explained above. Air lift plants have low efficiency, require a depth of well below the water table equal to about twice the lift measured from the water table and are hardly to be considered

in connection with separate small pumping plants. They are best adapted to a large number of wells (at least six or preferably more) placed close together. An air lift pump can be used advantageously for a well which is too crooked for the other types of pumps.

Where the source of water is ground water developed by deep wells with the water table at a large depth below the surface (50 to 200 feet or more) the choice is between a vertical centrifugal pump in a pit and a deep well pump which eliminates the pit. Deep well pumps are best adapted where the lift is in excess of 100 or 150 feet and for wells that do not yield more than about 400 gallons per minute. Their efficiency is greater than that of centrifugal pumps, but the cost of repairs and depreciation is greater.

The selection should be made only after careful consideration of the first cost of the pump and the annual cost of fuel, operation and maintenance. Where the lift is high, the fuel cost will be considerable and it is good economy not to select the cheapest pump obtainable, but one that is guaranteed for its efficiency. On the other hand, if the pump is to be operated only during a very small portion of the season, it would be poor economy to invest a large capital in a high grade pumping plant to save in fuel cost.

Importing Peanuts

The quantity of peanuts imported to this country has increased year by year until in 1920, the largest import year, there were 132,412,423 pounds of peanuts received, mostly grown in China. In 1910 the total was about 29,000,000 pounds. The 1920 import was principally of shelled peanuts, 120,000,000 pounds being imported that year. These nuts are practically the same as those grown in Virginia. A bushel of Virginia peanuts weighs 22 pounds, which shells out 13 2/3 pounds, or 66 2/3 per cent of the unshelled weight.

Shantung is the leading peanut producing region in China as its soil is particularly adapted to the growing of peanuts. The nut grown in that province is said to be larger than that grown in any other part of China and contains more oil. The provinces of Honan and Chihli rank next to Shantung in the production of peanuts. Peanut "farms" in Shantung are small plots of ground, often not over two acres in area, yet from the produce of small plots like this a Chinese farmer secures a living not only for himself and family but occasionally gives his sons a college education. This is all the more remarkable in that most Chinese farmers use only primitive methods of cultivation.

The peanut business in Shantung has largely been taken over by the Japanese as the successors of the Germans. Japanese traders at Tsingtau annually export large quantities of peanuts and peanut oil to the United States by way of Kobe and other Japanese ports. Kobe has consequently come to be considered one of the leading peanut and peanut oil markets of the Far East. Japan exports some peanuts, but the greater portion of the nuts tabulated by the United States customs officials as coming from Japan are actually produced in China.

Until the emergency tariff bill was enacted imported peanuts were taxed only 3/4 cent a pound and unshelled nuts 3/8 cent a pound. The present act, effective until November 27, prescribes a duty of 3 cents a pound on the importation of all foreign peanuts. The imports of peanuts have already shown a decline since the imposition of this duty, and its effect on receipts during the remaining period of its enforcement will be studied with much interest.

The exports of peanuts from the

United States have recently been only a fraction of the stock imported. Canada has received the great bulk of the peanuts going out of the country, both Virginia and Spanish varieties being shipped in volume to the larger eastern Canadian cities. Smaller quantities have been exported to Great Britain and the Latin American countries.

GOT MUCH GREATER YIELDS

Fertilizer demonstrations with tomatoes in Missouri have shown very favorable returns during 1921, according to E. M. Page, extension specialist in truck crops at the Missouri college of agriculture. Four tomato growers in each of the two counties participating, St. Louis and Jasper, carried on the demonstrations in cooperation with the county farm bureaus and the agricultural extension service. In Jasper County the growers were members of the new Jasper County Fruit and Truck Growers' Association and the product largely shipped through this organization. Records were kept by the growers, three from each county being completed.

These records show that in St. Louis County the average increase in yield per acre resulting from an application of 250 pounds of high grade fertilizer was 2,845 pounds of tomatoes, which, at the actual wholesale price on the days they were sold, were worth \$85.55. The cost of fertilizer and the labor involved in applying averaged about \$5, leaving the net gain from fertilizer around \$80. On these plots acid phosphate gave better returns than an equal weight of high grade mixed fertilizer such as 2-12-2. This, however, is not surprising because most of the plots were on rich soil, heavily manured, and phosphorus was the element most needed.

In Jasper County, however, the tomatoes were on poorer land and the mixed fertilizers gave slightly better results than the acid phosphate. Here the average increase was 4,175 pounds of tomatoes from the 250 pound applications of fertilizer, but the total yields were somewhat lower than in St. Louis County. The value of these tomatoes, based on the average price received by the association, less the cost of crates, etc., and shrinkage in grading, was about 2 cents per pound or \$83.50 gross increase per acre. Deducting \$5.55, the average cost of fertilizer and labor of applying, the records show a net increase at the rate of \$77.95 per acre for the Jasper County plots.

These returns may or may not be above the average but they illustrate forcibly the value of proper fertilization and the relatively large return

THE POMONA

Duplex Plunger Deep Well Pumps

are solving the pumping problems for many users during the period of low water levels. They will lift the water to the surface, and, if desired, deliver it to high elevations above ground and at lower power cost than any other system of pumping water.

did you get yours?

from a small investment in commercial fertilizer properly used. No attempt should be made to maintain yields entirely by commercial fertilizers, but the most permanent good will result when these are used in connection with proper crop rotation and the use of available manures.

BLACK SEED BEADS

In a recent issue of the Hawaiian Forester: "The large round black seeds of the native manele or soapberry tree (*Sapindus saponaria*) are

much in demand for necklaces. A quantity of this seed was recently secured by the superintendent of forestry from near the Volcano House on Hawaii and planted at the government nursery. These have germinated well and will soon be planted out on forest reserves."

This tree is native to the American tropics but is sparingly grown in California gardens as an ornamental and is not harmed, when of some size, by light frosts.

Los Angeles County Farm Sets New State Record

Another California state record was broken last month by a Holstein heifer in the herd of the Los Angeles County farm, when Whittier Pontiac Netherland 4th made 1,137.2 pounds butter in her yearly semi-official test. This gives her a lead of 29 pounds butter over the highest previous four year old production ever made in California. During the year she was observed by 19 different test supervisors from the state university and her milk has been officially weighed and tested by them. By reason of her excessive production the Holstein Friesian Association of America sent men to make verification tests during six of the 12 months.

The remarkable thing about this record is that she was not carried on the usual four time daily milking schedule after the first 14 days of the test and at no time thereafter did she have the benefit of box stall and forced feeding, all of which are invariably given to any cow running for a record. "Netherland" was handled during 351 days of the year just the same as each of the other 120 milking cows in the county farm herd with no special favors. Her total milk production for the year was 22,412 pounds, showing an average test of 4.06 per cent butterfat. This unusually high test is one of the outstanding characteristics of the strain from which she is bred. A great many closely related cows have returned yearly test records of better than four per cent average together with extraordinary quantities of milk. In her seven day official test made at the beginning of her four year old lactation she made a record of 28.75 pounds butter. During the entire year she averaged over 21.8 pounds butter for each of the 52 consecutive weeks.

The consistent production of the new record holder and her paternal sisters add more laurels to the famous De Kol of Valley Mead strain. Her sire, King Segis De Kol Mead, is still in active service in the Los Angeles county farm herd at the age of eight years. He is a son of King Segis Pontiac Emperor and De Kol of Valley Mead, the founder of one of the most famous producing families of the Holstein breed. She now has eighteen direct descendants that have made yearly records, the average production being 920 pounds butter and 19,159 pounds milk, with an average test of 3.84 per cent fat, 13 of the records being made under full age. This group contains the makers of five world records, the subject of this sketch being the third highest producer and the highest under full age.

The new record holder and her sire were both purchased by the present superintendent of the county farm, William R. Harriman, within the last three and one-half years. Other good records made by sisters of this famous heifer include a four year record of 824 pounds butter in a year, and seven day records of as high as 27 pounds butter for four year olds and 26 pounds for three year old heifers. None of this bull's daughters have yet been tested at full age, so that further sensational records may be expected. The herd at the county farm which has for three years borne the title of "World Champion Herd of 100 Cows," is building its future around these lines of breeding. Three of the present herd sires are direct descendants of De Kol of Valley Mead, being respectively a son, a grandson through her highest record daughter, and a great grandson through her latest state record grand daughter. This is

line breeding to intensify the influence of this wonderful producing strain.

The champion is now in calf to the county farm's junior herd sire, King Korndyke Pontiac Mead, whose dam is De Kol of Valley Mead 2d, a 1,000 pound four year old. His \$12,000 sire is out of the famous Miss Valley Mead De Kol Walker, an 1,100 pound and 36 pound three year old daughter of De Kol of Valley Mead 2d. The resulting calf will have three crosses to old De Kol of Valley Mead through some of her very greatest descendants, and a bull of such breeding should unfailingly impress the characteristics of this great strain on his offspring.

The milk and cream produced by this herd is all consumed by the patients of the Los Angeles county farm hospital and juvenile hall, every precaution being taken to keep the purity of the product at the highest possible standard.

When H. J. Long, Fallon, Nevada, was selecting his foundation for a herd of registered Holsteins a few years ago most of his female purchases were made from among the tops of some of the best California sales. To head this select group of females he purchased one of the best young sons of the famous Sir Pieter Ormsby Mercedes. This young sire has for a dam the 34 pound three year old Glen Canary De Kol, and is therefore a full brother to the 1,323.30 pound yearly record four year old Glen Canary De Kol 2nd. Official testing in the Long herd has now begun to establish the correctness of foundation selection. The highest seven day production in the herd to date was made by Blamar 2nd, with 31.44 pounds butter from 587.7 pounds milk. She is by Dutchland Colantha Sir Ormsby, son of Colantha Johanna Lad, and out of the 29.50 pound cow Blamar. Gracia Colantha Burke, another daughter of the same sire, and out of the foundation cow Alamo, became Nevada's first 30 pound cow when she made 30.08 pounds butter in seven days. Carnation Skylark Segis, a daughter of Forward Prince Segis, out of a daughter of Dutchland Governor Sir Colantha, second dam a daughter of Sir Skylark Ormsby Hengerveld, recently made 30.97 pounds butter from 749 pounds milk in seven days as a four year old. Another splendid young female in the herd is Cascade Mary Ormsby, with 28.51 pounds butter from 655.9 pounds milk in seven days as a three year old. She is a daughter of Sir Korndyke Ormsby Piebe and out of a 29.90 pound daughter of Sir Johanna Ruth Fayne. The most pleasing record so far made in the herd, however, is that of the heifer Longheath Colantha Ormsby that calved at two years seven months and made 24.24 pounds butter from 461 pounds milk in seven days. She is the first daughter of the young herd sire King Ormsby Canary Johanna, the son of Sir Pieter Ormsby Mercedes previously referred to as the head of the herd, to be tested and her record promises much for the 40 sisters she has coming on in the herd. She is a heifer of splendid type and should develop into a cow of remarkable production in her mature form.

Howard Vaughn, manager of the California Shorthorn Breeders' Association sale to be held at the university farm, Davis, Stockmen's Week, has announced entries from the following herds: Blackhawk Ranch, Diablo; Edinger-Johnston Co., Hood; Caledonia Farms, West Sacramento; Straloch Farm, Davis; University of

California; Geo. E. Dierssen, Sacramento; H. M. Elberg, Woodland; Geo. S. Simms, Sacramento; W. T. Chapple, Willits; Gardiner Pierce, Davis; Howard Vaughn, Dixon; Dr. R. T. McGurk, Stockton.

As if You Wasted Just So Much Milk!

Just as foolish to waste milk one way as another—and there most certainly is a milk loss when a cow has any form of udder or teat discomfort. Any chap, sore, scratch, hardened or inflamed condition of the udder or teats should be looked after at once.

BAG BALM

the great healing ointment penetrates, soothes and heals such troubles promptly. Very reliable and effective in reducing Caked Bag and in treating Bunches and Cow Pox. Restores normal tissues and healthy circulation. Big 10-ounce package at reduced price of 50c—at feed dealers, general stores, druggists.

RABBITS

Pedigreed Flemish Giants—No fancy prices. Maud Beeching, 1578 W. 46th St., Los Angeles.

PAYNE'S GARDEN GUIDE

Payne's Garden Guide for 1922, which contains many valuable statements as to gardening and an illustrated catalog of seeds and plants, is being mailed by Theodore Payne, 345 South Main Street, Los Angeles. Amongst the valuable suggestions is a garden calendar for each month of the year, together with seeding table and much other general information. The body of the book is made up of text on vegetable and ornamental plants and flowers, arranged alphabetically. In addition there are illustrations and price lists of garden tools, spray pumps, lawn mowers, etc.

COMPLETE EVEN TO THE INDEX

The Morris and Snow Seed Co., 439 South Main Street, Los Angeles, has been fortunate in bringing together a great mass of information as to seeds and plants of vegetables and ornamentals in their catalog for 1922. The calendar of planting operations is, we believe, the most extended we have seen. In addition there are tables giving number of plants or seeds required to the acre, sowing tables for the garden, in fact, a lot of regular garden planting stuff. Here are a few sentences at random: "Don't work freshly wet ground. Don't set plants or roots without watering at once. Don't plant seeds or bulbs in dry ground. Don't let weeds grow."

Reliable Blue Flame Brooder

The leader of oil burning brooders. Easy to operate, economical, abundance of heat. Four sizes for flocks of 1 to 1000. We also have Queen coal burning brooders, electric and hot water systems. Baby chicks and pullets. Ask for 1922 general catalogue.

C. E. HILL CO.

POTATOES AND ONIONS

These are the actual prices obtained between 7 and 8 o'clock, January 24 by wholesalers in their sales to retailers, peddlers, hotels, restaurants, cafeterias, etc. Terms: Cash on walk. There may be slight fluctuations during the day's trading. The potato market shows considerable strength at present, especially in the Russets, which are selling on an average of 3.00. Sweet potatoes met with a moderate demand, particularly in the case of sacked stock, which brought 3.00 to 3.50 per hundredweight. Peppers, peas and eggplant were very scarce and there were not enough sales reported to make a market. Potatoes: Movement moderate, market steady. Lugs, mostly 1.00@1.10. Stocktons: Burbanks, per cwt., best mostly 2.50@2.75; few, 2.85; poorer, 2.25@2.40. Idahos: Russets, best, mostly 2.85@3.00; few, 3.25; bakers, 3.50. Sweet Potatoes: Movement moderate, market steady. Locals, No. 1 best, per lug, 1.00@1.15; poorer, 80@90 per cwt.; No. 1, 3.00@3.50; Arkansas: Nancy Halls, bushel baskets, 5@5½ per lb. Onions: Demand moderate, market steady. Stocktons, per cwt.: White Globes, best, mostly 8.25@9.00; Browns, best, 7.00@7.50; poorer, 6.50; lugs, Whites, best, 2.75@3.00; Browns, 2.00@2.25; Lompoc Browns, 7.00@7.50. Garlic: 8@9; poorer, 5.

VEGETABLES

These are the actual prices obtained between 7 and 8 o'clock, January 24, by wholesalers in their sales to retailers, peddlers, hotels, restaurants, cafeterias, etc. Terms: Cash on the walk. The supply of vegetables on the local produce market has been limited by the recent freeze and several commodities were scarce and higher in price yesterday. Cauliflower averaged 50 cents a crate higher than Monday and sold from 2.75 to 3 a field crate. Celery was also high, the best local stock selling from 6.25 to 6.50 per crate. Cabbage prices were unchanged and much poor stock was offered. Lettuce was firm, but a good deal of the offerings were only of poor quality. Artichokes: Doz., 1.50@1.75. Brussels sprouts: 15@18 lb. Beets: Sk., 2.50@2.75. Bunched vegetables: Market steady. Per doz. bunches: Turnips, 40@45; carrots, 75; beets, 75; radishes, 25@30; parsley, 15; spinach, 40. Cabbage: Market firm. Per field crate, mostly 1.25@1.50; few, 1.75. Cauliflower: Market stronger. Wide range in quality. Per field crate, mostly 2.75@3.00; few, 3.25; poorer, 2.50. Carrots: Sk., 2.25@2.75. Celery: Market stronger. Locals: Best, 6.25@6.50; poorer, 5.00@5.50. Cucumbers: Market steady. Hothouse, mostly 1.00@2.50. Lettuce: Demand moderate. Locals: Field crates, 1.00@1.25; few best high as 1.50; poorer, 1.75. Parsnips: 75@1.00.

Onions, green: 20 bunch. Peppers: Locals: Chili mostly 12@15 lb. Turnips: Sk., 1.00@1.25. Tomatoes: Market steady. Mex., lug, repacked, 4.00@4.50; cr., 3.75.

FRESH FRUITS

Apples: Demand and movement moderate, market steady. Locals: Winesaps, Romes and King Davids, mostly 4@5, few 6; Delicious, 6@7; few 7 per lb.; B grade Delicious, 2.25@2.75; fancy, 2.75@3.25; Winesaps, fancy, 2.50@3.00; Romes, fancy, 2.50@3.00; B grade, 1.75@2.00. Watsonville, fancy, 3½ and 4 tier Bellefleurs, 1.60@1.65; few 1.75; poorer, 1.40@1.50; 4½ tier, 1.30; loose, per lb., 3@4; Pearmain, tier, 1.70; 4 tier, fancy, 2.10@2.25; B grade, 1.70; 4 tier, fancy, 2.10@2.25; Yellow Newtown Pippins, 4 tier, fancy, 2.00@2.25; 3½ tier, 2.10; loose, 5 per lb. Northwestern: Spitzenburgs, medium to large, extra fancy, 3.00@3.25; fancy, 2.75 @3.00; Winesaps, extra fancy, medium size, 3.00@3.25; Romes, extra fancy, 2.75 @3.25.

CITRUS FRUITS

Grapefruit: Movement slow, market dull. Californians, Northern: Packed box, 2.75@3.00; small, 2.50; market pack, 2.00 @2.50. Imperial Valley, 4.00@4.25. Arizonas: Seedless, 3.75@4.75, according to size and quality. Lemons: Demand and movement slow, market steady. Locals: Loose boxes mostly 1.25@1.50; few, 1.75; poorer, 1.00; lugs, 40@50; few best, 75. Oranges: Demand limited for packed stock, market weak. Navels, special brands, 100s-150s, mostly 4.00@4.50; 176s-216s, 4.00@4.25; market pack, 2.00@3.50, according to size and quality; culls, field boxes, best, 1.00@1.25; poorer, 50¢@75. Tangerines: Demand and movement light, mostly 5@6 lb.; few fy., 7@8.

GRAIN

Prices on L. A. Grain Exchange: Milo, 1.42½@1.45. Barley, 1.32½@1.35.

HAY

Alfalfa Growers of California report: Market showed more activity past week. Severe cold lowered prospects for early green feed. One of the many unusual features of the present situation is that our Riverside district has been filling orders for alfalfa hay from Idaho and the Coachella Valley, which districts are normally supplied from Imperial Valley. Stocks of marketing hay in Imperial Valley are almost exhausted and local prices there are about the same as in Los Angeles. There were 1,840 tons of grain and alfalfa hay received on the Los Angeles tracks the week ending January 21, with 600 tons held over.

Prevailing prices last week, delivered in the vicinity of Los Angeles:

No. 1 dairy alfalfa	25.00
Standard	20.00

Quotations by Nichols-Loomis Company. Following are prices to growers f. o. b. Los Angeles in carload lots; handling and commission must be added to obtain retail prices on new hay:

Tame Oats	22.00@28.00
Barley	18.00@24.00
Alfalfa, Rabbit	24.00@28.00
Alfalfa, No. 1 Dairy	20.00@22.00
Standard	16.00@18.00
Straw	10.00

VEGETABLES

Prices furnished by state department of agriculture, division of markets: Sales to Retailers: Below are listed averages of actual prices obtained between 7:30 and 9 o'clock this morning by wholesalers from their sales to retailers, hotels, restaurants, cafeterias, etc. Terms: Cash on walk. Slight fluctuations may be noted during the day's trading, while higher prices are sometimes obtained where credit is given or goods are delivered. Reports of frost damage to peas, tomatoes, cucumbers, squash and peppers in the Imperial Valley continued to disrupt the local market and gave prices a very firm tone. One report from the Imperial Valley Vegetable and Melon Growers' Association was to the effect that the entire crop of those vegetables in the Imperial Valley was a total loss, but nothing definite can be ascertained until the frost dries out. Artichokes: Fancy, 18.00@20.00; choice, 1.15@1.50 per dozen; off grades, 50¢@75. Bunched vegetables: Carrots, 50 doz.; turnips, 40@50 doz.; beets, 40@50 doz.; parsley, 30. Cabbage: 2.00@2.25 per crate, 1½ per lb., 75¢@1.00 per doz. Carrots: 90¢@1.00 per sack. Cauliflower: 1.25@1.50 per doz. Celery: River fy., mostly 5.50@6.50 per crate; poorer, 3.00@4.50. Cucumbers: Per outside sm. box, 2.25 @2.50; hothouse, fancy, 2.50@3.00 doz.; do. smaller, 4.00; English, 1.20@1.50 per doz. Eggplant: Lb., 15; poorer, 5@10. Endive: 45¢@50 per lb. Garlic: 4¢@6 per lb. for medium grades; poorer quality, less. Lettuce: Small crate, local, 1.25@1.50; iced, Los Angeles, 3.00@3.25; Imperial Valley, 3.00@4.00. Mushrooms: Small box, 50@75; larger, 75¢@2.00, or 25¢@50 per lb. Olives: 5¢@9 per lb. Onions: Cold storage, browns, firm, mostly 5.75@6.25; white globe, mostly 7.50 @8.00; pickle onions, brown, 4.50@5.00; green onions, 2.25 per box. Peas: 15¢@20 lb. Beans: Lb., 12@15; Florida, fine quality, 40¢@50; limas, 6@10. Potatoes: Rivers, fancy, 1.90@2.10; Oregon Burbanks, 2.25@2.40; Idaho Netted Gems, 2.40@2.60; off grades lower. Pumpkins: Per sack, 75¢@1.00 per 90 lb. sack. Rhubarb: 2.50@3.00 per apple box; off grades, 1.75@2.25. Squash: Summer Brawley, 3.00@3.50, small crate; cream, 75¢@1.00 per lug; Hubbard, 1.00@1.50 per 90 lb. sack. Spinach: 6¢@10 per lb. Sprouts: 9¢@11 per lb. Sweet potatoes: Per cwt., 3.75@4.00. Yams: 4.00@4.50. Tomatoes: Repacked, Southern, best, 2.00@2.40 cr.; Mex., 4.00@4.50 per L. A. lug; off grades, 2.75@3.00; hothouse, 4.50 @5.50. Turnips: 1.10@1.50 sk.

HAY AND FEED

A. W. Scott & Co. says: Arrivals past week 845 tons. Receipts continue moderate but demand has been light. Best grades continue in better demand. Interior trading has been a little better possibly owing to the freight reduction in more remote points permitting shipments at a little better figure.

We quote today wholesale prices as appear from dealer carload lots as appear from dealer transfers upon the markets in San Francisco (for prices to consumers, charges of switching, cartage, commission at handling expenses must be added, according to conditions).

Wheat hay, fair grade	14.00@17.00
Tame oat hay	15.00@18.00
Wild oat hay	1

Citrus Markets

Los Angeles, January 25, 1922.

Oranges are going forward with caution. Only those which were picked before the freeze are being shipped. Fortunately there was a heavy supply in Navel packing houses. No picking will be done until February 6. The effect on the market is as yet entirely problematical but the determination on the part of the growers to prevent any injured fruit from going forward will, without question, have stabilizing effect.

Lemons are stronger than for some time. There is sufficient stock in packing houses to supply the demand for at least a couple of months. The early summer shipments will be greatly lessened by the freeze. Presumably prices will be very satisfactory for all stock in hand.

Shipments

Shipment of citrus fruits to date since November 1, 1921. Southern California: Oranges, 4,275 cars; lemons, 1,284; total, 5,559. To same date last season: Oranges, 4,438; lemons, 1,169; total, 4,607. From Central California to date this season: Oranges, 4,113; lemons, 69; total, 4,182. To same date last season: Oranges, 3,950; lemons, 59; total, 4,009. From Northern California to date this season: Oranges, 666; lemons, 7; total, 373. To same date last season: Oranges, 301; lemons, 3; total, 304.

THE WEATHER GAVE US A JOLT, BUT WE'RE STILL ON TOP

(Continued from Page 91.)

Near some three degrees higher than in 1913 and practically the same as in the cold spell of 1919.

It must also be remembered that the 1913 cold spell followed electrical windstorms which resulted in serious injury to fruit, sapping the life of the tree as well, so that the injury from the cold weather was far greater than under ordinary conditions. This year's cold was preceded by heavy rains which increased humidity and put the trees in the best of condition to withstand cold weather. While it is probable much fruit will be injured and the broken cells result in its drying out there is practically no injury to the trees, at least that is the estimate of many a grower this early in the game. This drying out will not be apparent for at least two weeks and possibly not for 30 days, but owing to the two weeks period being sufficient to determine to an extent at least the injury to the fruit, the following resolution was unanimously adopted by orange growers gathered at a meeting of Los Angeles County range growers presided over by Jas. Britt, deputy state market director:

"Whereas, the shipment of oranges damaged by frost cannot but seriously affect the reputation of the California citrus industry, and

"Whereas, it is the intention of this meeting to protect both the industry and the consumer, and

"Whereas, it is at the present time impossible to segregate the damaged fruit, and

"Whereas, it will be possible to make some such segregation in the short time of two weeks; now, therefore, be it

"Resolved, that all picking of oranges be stopped and not resumed before February 6; and be it further

"Resolved, that the county horticultural commission be asked to put to force all its powers to stop shipments of citrus fruit damaged by frost."

The extent of the injury is entirely a matter of guesswork. Favorable features are the atmospheric conditions, the abundance of water in the soil, and the condition of the trees. On the other hand, it must be admitted that the temperature was low for a long period. The cold was general, reaching from Lower California to the northern end of this state, and the speakers at the meetings who maintained that their sections were in the lightest belt were greeted with laughter and the shout, "The same old story."

On Monday morning Commissioner Ryan took up the matter of the county of Los Angeles aiding in the campaign to be made for the protection of California's reputation. The board of supervisors acted instantly and passed an ordinance making it a misdemeanor to ship or market, or transport over highway outside of municipalities for the purpose of marketing or shipment, any quantity of fruit which contains 15 per cent or more of citrus fruits showing in two or more segments of each fruit marked evidence of frost injury.

This emergency ordinance was also immediately adopted by San Bernardino and Riverside Counties, and presumably before these words are read all other citrus counties will have passed similar ordinances. There were about 450 cars of oranges and lemons in packing houses before the freeze. These will be shipped, but greatest care is being taken that absolutely all picking shall be stopped until February 26. Deputy State Market Director Britt has also taken the matter up with the four transcontinental railways and urged them to aid in the campaign of protecting California's good name. This entire campaign is receiving heartiest endorsement of nine-tenths of the fruit growers, and the Fruit Growers' Exchange is most active in the propaganda which it is hoped will result in holding back injured fruit until by the use of the water separator the injured may be automatically separated from the good fruit.

SUIT AGAINST RAISIN GROWERS ENDED

(Continued from Page 91.)

life of the community rather than that the principle of cooperation is wrong. But in that case we must all join hands for the purpose of getting a new management instead of a new organization.

Firm at Opening Price

"Paragraph five provides that the practice of selling 'firm at opening' should be discontinued. We believe that this is a vicious method of doing business, should never have been practiced and had discontinued it ourselves over a year ago. This paragraph further provides that the guaranteeing of our prices 'against our own decline' should be discontinued. We do not agree with the government in this connection. We believe that the 'guarantee against decline' is not only right, but that it is good merchandising; that it costs the consumer nothing and stimulates sales because it practically guarantees the purchaser against loss, enabling him to work on a closer margin. However, this is a matter that is not vital and we, of course, expect to carry out the provisions of this paragraph in spirit as well as in letter.

"Paragraph six provides that we have not the right to lease or acquire by purchase packing houses belonging to our competitors. We have no objection to this paragraph because we have learned by experience that it is much cheaper to build packing houses than it is to buy them from our competitors.

Selling to Competitors

"Paragraph seven prohibits us from making contracts with any of our competitors that makes them our exclusive agent, but there is nothing in it to prevent the sale by us of raisins to one or all of them if it is to our mutual advantage. Neither is it necessary to sell to all because we sell to one. The question of whether or not we sell at least a part of our product to our competitors is not in itself of great importance as it may be at times advisable to do so, and our interpretation of this paragraph as affecting this much discussed question is that we have the right but not the obligation to sell them. If this interpretation is correct it is more than likely that this right can be exercised with justice to ourselves and to the advantage of all concerned. At any rate, so far as we are concerned this clause is entirely unobjectionable.

"Paragraph eight provides that we do not have the right to curtail or decrease the production of raisins.

This is something we have never done and never expect to do.

Destruction of Raisins

"Paragraph nine provides that we do not have the right to restrict or lessen competition in the marketing of raisins by destruction or waste of same. We have, of course, never been guilty of a practice of this kind and are only enjoined from doing a thing that we have never done and never expect to do.

"Paragraph 10 prohibits the making of contracts by which the price of the seller is fixed in advance of that contract. This is also a practice that we have never followed, and, therefore, the injunction against it matters not.

"Paragraph 11 provides that we do not have the right to make a sale of raisins and attach the condition that the buyer thereof cannot deal in raisins of our competitors. We are today selling to thousands of buyers who buy from our competitors and have no desire to change this rule, and, therefore, we are enjoined in this paragraph from doing something that we have never done and never expect to do, and this paragraph is not objectionable.

"The last paragraph provides that the jurisdiction of this case is to be retained for the purpose of modifying this decree by the court ordering it, which, of course, is entirely satisfactory to us, for we have an abiding faith and confidence in the final justice of our courts.

Hope This Is End

"This decree, we believe and hope, is the final culmination of this case, so far as the government is concerned. It is now almost three years since we were called before the federal trade commission and later before the department of justice to fight for the right of cooperative organization to pack and sell its own product. In these three years every possible phase of this question has been considered from every possible angle, the final answer is the above mentioned decree, which leaves us in a position by which we can continue business along the lines of our present policy, and with this decision we are, of course, more than pleased.

"We are making this simple statement because we know that there is no other question among the raisin growers of California so important as this. The life of this organization means so much to this state, and the questions involved mean so much to the thousands of men and women engaged in the production of raisins that it is a matter for congratulation that so satisfactory a conclusion has been reached. This suit has cost many anxious moments, it has cost approximately 150 thousand dollars in direct expenditure of money and an amount that we cannot determine accurately, but would estimate to be several million dollars on the sale of the 1920 crop, but even then we believe the gain more than offsets the loss for we have learned, as we never knew before, that in the face of a common danger the raisin growers of California will rise as one man to fight for what they believe are their rights, and this spirit, in the end, is worth infinitely more than the cost of this suit. In one form or another the great fight for cooperation among the farmers of the United States has just begun and in this great fight we must do our part and ever be found in the front ranks.

"And now forgetting the things that are behind let us turn our backs upon the past and our faces to the future. With our eyes alert and our heads erect let us move forward with a greater determination than ever to make the Sun-Maid Raisin Growers the greatest cooperative marketing agency in the world, and if we are to succeed in this we must never forget that we serve not ourselves alone but the hundred million consumers of this country."

HONEY PRODUCERS

(Continued from Page 107.)

and promote the selling work of the exchange, if and when the exchange is placed upon a firm foundation through reenrollment of its members.

At the same time Governor Stephens has set aside the week of February 6-11 as "Honey Week" in California, during which time honey will

be sold by the retail trade at wholesale prices, this in order to build up a market for this important California product.

It looks like brighter days for the honey man.

SUMMARY OF FOREIGN CROP PROSPECTS

Growing conditions for the winter wheat crop have continued favorable in Argentina, and a general feeling of confidence prevails concerning the yield of the new crop. The official estimate for the current season for the wheat area is 13,927,000 acres, compared with 14,957,000 acres in 1920-21. Harvesting is now in progress but no official estimate of production has been issued. The condition of other cereal crops is generally good, and fair to good yields are reported. The condition of the linseed crop is poor, and a low yield is expected.

Harvesting the wheat crop is in progress in Australia. Some complaints of damage from excessive heat are reported from various sections of the Commonwealth, and in New South Wales bush fires and hailstorms have caused some damage. The preliminary official estimate of production is 146,614,000 bushels, compared with 146,799,000 bushels in 1920-21. Quality of grain is generally reported to be very good. The latest estimates of the wheat crop in the Union of South Africa are very favorable, giving the yield for 1921-22 as 8,449,000 bushels, compared with 8,112,000 in 1920-21. The area of wheat in New Zealand shows considerable increase, being reported as 363,000 acres, compared with 223,000 acres in 1920-21.

Favorable Outlook for India's Crop

The fall crops of food grains have yielded well in British India and the outlook for the spring crops is favorable. Prospects for the wheat crop in the Punjab and Central Provinces, which together produce nearly half of India's total wheat crop, are very good. Rain is reported to be greatly needed in parts of East Deccan, but conditions are fair elsewhere in Bombay. Rain is also needed in some sections of Bengal. The second forecast for rice as issued by the Department of Statistics, India, gives the rice area for 1921-22 as 79,154,000 acres, or 103.5 per cent of 1920-21 and 102.7 per cent of the five year average.

The second sesamum forecast, which contains on an average about 74 per cent of the total area under sesamum in British India, gives the area for 1921-22 as 2,698,000 acres, compared with 2,221,000 in 1920-21. Sesamum is an important seed in India from which is made gingili oil. The first peanut forecast based on reports received from the three provinces of Madras, Burma, and Bombay, which comprises 99 per cent of the entire peanut area of British India, gives the area sown for 1921-22 as 1,489,000 acres, compared with 1,447,000 acres in 1920-21, or an increase of 3 per cent.

The condition of the fall sown cereals is variable throughout Europe and in many sections a poor start has been made. Germination of winter wheat, rye, and oats has been good in Great Britain and strong healthy growth is reported. The condition of winter wheat and rye is slightly below average in Germany and slightly above average in Austria and Poland. The continuous drouth hindered seeding in Hungary and has curtailed the acreage somewhat. Conditions have been favorable in Roumania, and a fair acreage has been sown. Seeding and growing conditions have been very unfavorable in France due to the long drouth which has curtailed planting and hindered good germination. Recent rains have been beneficial in Northern Africa, and a large acreage of wheat and other fall cereals is being sown. Fall sown wheat is entering the winter in good condition in Canada, and the area sown shows an increase of 6 per cent compared with last year. The winter wheat crop of the United States has the very low December condition of 76 per cent of a normal, while the average of the preceding 10 years is 89 per cent. The condition of the winter rye crop is better than the average.

Decrease in Cotton Production

The prospects for the cotton crop in British India are good. The third forecast of the department of statistics, India, gives the cotton area for 1921-22 as 17,855,000 acres, compared with 19,704,000 acres in 1920-21 and the yield as 3,623,000 American bales of 500 pounds (gross weight), compared with 3,030,000 bales in 1920-21. On the basis of these figures the average yield per acre of the present crop for all India is 97 pounds, compared with 74 pounds last year. The yield of the cotton crop just harvested in the United States is 8,340,000 bales of 500 pounds (gross weight) compared with 13,440,000 in 1920. The cotton crop in Egypt also shows considerable decrease, being 634,000 bales of 500 pounds (gross weight) in 1921, compared with 1,251,000 in 1920.

AN OLD ONE, BUT STILL GOOD

Tourist: "What's that beast?"

Native: "That's a razorback hawk, suh."

Tourist: "What's he rubbing himself on the tree for?"

Native: "Jest stopping hisself, suh, jest stopping hisself."

Do you know—

- three simple tests for proving a hen a good layer?
- the best months in which to cull the poor layers?
- how to pen-fatten birds for market?
- what are the feed requirements of the laying hen?
- the correct proportion of grain and mash to be fed to adult laying stock for maximum production?

These are but a few of the egg-making, money-making questions answered in the new and enlarged edition of "Makes Hens Happy." It is free—send for your copy today.

Free

this 38 page guide-book
to bigger poultry profits!

Here is by far the most complete and helpful handbook we have ever issued on poultry husbandry. No half-fed, half-baked "theories" find place in this book. It is the outgrowth of many years of observation and practical experience in making hens happy and profitable.

The results of State and Government poultry stations; the work carried on by our feed specialists and at our own Experimental Farm; the practical, hard-pan experience of thousands of successful poultrymen up and down the Pacific Coast—all this is summed up and boiled down in this compact 38-page book. Even such subjects as breeding, housing, artificial lighting, the care of the flock during moulting, etc., are discussed.

No poultryman—regardless how "seasoned" he may be—can afford to pass up this guide-book to bigger poultry-profits. We would like every poultryman—whether or not he uses Sperry Feeds—to benefit by the information and helpful advice contained in this book.

That's why we urge you to send for your copy at once. No telling how long the edition will last. The sure way is to get your request in the mail without delay. Don't bother to write a letter—simply clip the coupon, fill out and mail today.

Grafting Walnut Trees

MANY requests have come recently to the Cultivator for information as to grafting over unproductive walnut trees or trees producing hard shelled nuts or fruits of lower grade and occasionally as to making over old seedling trees of the native California Black growing on hillside or in canyon. As the process is comparatively simple there is little new which may be written regarding it so we take the liberty of repeating an article written by J. B. Neff for Cultivator readers and used in the issue of January 17, 1920. On this page we also use illustrations taken with the Cultivator camera at a grafting demonstration at Whittier.

* * *

Success in grafting walnut trees requires greater care than in most of the deciduous fruit trees. There are certain rules to be observed which must be carefully followed and at the same time there are other supposed rules which have no bearing on success.

The larger part of the nursery grafting is done by persons who are expert hence we will confine our remarks to the grafting of older trees which have been planted in orchard form and are not producing as well as could be desired. It is not good policy to allow walnut trees which are not producing well to grow to the age of 15 or more years without top grafting, as those trees have large branches which have to be taken off, and scars are left which are slow in healing over and which, if not given more care than the average grower will have time to give, will eventually cause much damage to the trees. If, however, there are thrifty trees in the orchard which are not producing well they can be greatly improved and will come into good bearing much sooner by top

grafting than would be the case if the tree was removed and a new one planted.

If it is at all possible the scions should be placed in branches not more than three inches in diameter and two or three scions should be placed in each branch. If the scions should all grow they can be left the first year and the best one left at pruning time next winter. In most cases three to five branches will be enough to leave in which to place the scions, and the other branches should be cut close to the body of the tree before beginning the work of placing the scions. Scions should always be of solid, mature wood, that is, with as small pith as can be conveniently found, and with good living buds. The growth having buds close together is best, as shorter scions can be used, which is an advantage, as they require less moisture and are not so liable to be moved by birds alighting on them.

The most convenient size is about one-fourth inch in diameter and three and one-half inches long, but equally good success is obtained with scions much smaller, or as large as five-eighths of an inch diameter if properly placed. It is probably well to state in this connection that the movement of the sap in the trees is upward through the white wood and downward through the cambium layer (between bark and wood), that the requirements for successful grafting are that the union of scion and stock be such that the upward flow of the sap in the stock can pass into the scion and that the downward flow can pass from the cambium of the scion to the cambium of the stock. Also that all cuts, on ends of scions as well as where the scion is inserted in the stock, shall be thoroughly covered with wax and air

(Continued on Page 125)

Tools and Methods

Upper photo shows tools and appliances necessary. In the box beside the pruning shears are the scions preserved in moist shavings. Leaning against the tree is the large saw which should not be too coarse but fine enough to make fairly smooth cut. The large cleaver-like knife at left end of tool box is used for splitting the stub of the old tree, the mallet being used for this purpose. Next to the knife are a couple of wedges. These are ordinary blacksmith made, bent at right angle to facilitate prying open of the split for insertion of scion. Between the wedges and the mallet is a sharp knife for the careful work of cutting the scions. The two pruning saws at right end of the box are for emergency work under conditions where large saw would not operate. At the right of the picture is an ordinary five gallon oil can with top and part of one side cut out. Inside may be seen ordinary wick oil stove. The side opening is for draft and for access to the burner. In case of wind the "door" to the heater may be closed. The kettle of grafting wax is shown between the heater and the tool box.

Middle picture shows Prof. Batchelor calling attention to method of cutting the scion.

Lower picture shows a California black grafted to Ekrhardt and old enough to begin production.

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

If among the more than 40,000 Cultivator's weekly circulation any fail to find any article they desire to purchase advertised in the Cultivator's columns, a special request is extended you to let your wants be known to the California Cultivator and we will place you in touch with proper parties.

EDITORIALETTES

Walnut growers will soon be asking for information as to grafting over unproductive or undesirable walnut trees. We have it ready-made on cover page of this issue. The walnut grower has one advantage over the dairyman. His only course with the unproductive cow is to send her to the block, and some walnut growers, thinking their position is the same, replenish their woodpiles with these unproductive trees. With good healthy trees, however, it is possible where Mr. Neff's suggestions are followed to make a much more satisfactory disposal of them.

* * *

The other day we attended the annual meeting of the Poultry Producers of Southern California. This is a purely cooperative poultry marketing association and is having what all cooperative associations have, trouble. The trouble is not serious, however, for it is the loss of a few members who have found that some of their neighbors, shrewder than the average of producers, have succeeded in getting a trifle

more for their product than are the association members. Others, appreciating the value of cooperation, are bringing their wares into the association, and the loss is being balanced so that the new year's outlook is satisfying to the officials of the organization. The whole trend of the meeting was toward closer organization, and the determination was often expressed "We will remain true to the cooperative principles backed by this association."

* * *

One trouble with cooperators is that too often they are not stand-patters. It takes stick-to-it-iveness to succeed in cooperation, and the producer who would market his goods in the best market must not be stampeded or set to drifting here and there because a temporary penny may look larger to him than a permanent dollar. The greatest work accomplished by the Poultry Producers has been the stabilizing of the market. If an organization which can do that is destroyed it will result in an irretrievable loss to the entire industry.

* * *

It is simply astonishing to note the fierce onslaughts already being made on the water and power act on which the voters will cast their ballots next November. Large interests which appreciate the wonderful wealth in white coal hidden in California mountains are presenting every argument within their power to discredit the movement to secure passage of this act which will benefit all the people. It is claimed the people do not have the business efficiency nor the capital to put across this great proposition, and if they did it would cost them far in excess of what it would cost the private companies. The only reply needed is to call attention to the fact that the city of Los Angeles is providing electrical energy for both illumination and power cheaper than the public utility corporations are securing it for surrounding communities.

* * *

Announcement was made that there would be no citrus institute in connection with the National Orange Show this year. We note in San Bernardino County local papers items to the effect that the institute will open, however, on Tuesday, February 21. There is to be discussion of citrus fertilization and scaly bark of orange trees and other diseases of the citrus.

* * *

Secretary Dudley of the Sacramento chamber of commerce has been touching the high spots of the East and is now doing the state in the interests of "The Days of Forty-Nine." It is but a few weeks now until Sacramento and all California will be celebrating gold discovery day. Cabins of hermits through the old gold diggings are being ransacked for suggestions which may renew memories of "Miners—49ers" and educate others of us in the real events following the discovery of gold in California.

* * *

"They say" that gold was discovered on January 24, 1848. Others, however, maintain that it was January 19. None of us are worrying particularly excepting a few who are anxious to make Gold Discovery Day a legal holiday in California. All honor to Marshall and others connected with the discovery of gold, but for heaven's sake give us a rest on legal holidays. It's hard enough now to go to the bank and draw out a bit of money to carry us over Sunday and find the doors closed. If this continues we will have to resort to the stocking for our banking operations.

PROTECTING THE ORANGE

The value of the California orange crop is endangered by the wilfulness of some shippers in insisting that their fruit picked since the recent cold spell shall go forward regardless of inspection of standardization officials. Standardization specialists have made careful examination of fruits which have been shipped and declare the cells are already showing a breaking down, likewise proof of frost injury through crystallization is also possible. The railroads announce that they will not ship excepting they have certificate from standardization officials. As a rule orange growers are standing pat with the officials and demanding that the good name of the California orange be sustained by absolutely preventing any injured fruit going forward. Where shipment of fruit picked prior to the frost has been carried on officials have made inspection of fruit in packing house while car was being packed out and given it proper certification.

USURY

The president has ordered investigation of the charge that banks which have been advanced funds by the war finance corporation at 5 or 5½ per cent have turned and loaned to livestock men at rates greatly in excess of 7½, which was the maximum allowed under agreement with the government when the money was advanced to the banks.

This is worse than usury; it is common thievery, and a bank which accepts money from that fund and then charges this excessive interest should be advertised from one end of the land to the other. It is a plain violation of trust which the people today are not in the mood to stand for.

STIR UP THE AIR

Many years ago Newton B. Pierce, at that time connected with the department of agriculture, made a statement through the columns of the California Cultivator that he believed an immense windmill, reversed in its operation, that is, propelled by an engine, could be induced to agitate the atmosphere and bring to earth some of the warmer currents above. The suggestion was not deemed practical by citrus growers, at least was never tried to any extent so far as we know.

Now comes Ontario with a try-out of practically the same proposition. L. J. Whitlock is using immense electric fans in the effort to draw warmer air from 320 to 400 feet above the ground and mix with the cooler air below. He maintains that he has made a difference in temperature of some two to four degrees.

ANOTHER RAIN

Another rain covering the entire coast has given precipitation varying from a small fraction of an inch to three inches. As was the case with the end of December rain, the heaviest precipitation was south of Tehachapi and the precipitation in the north is not yet up to normal. Eureka's total to the present is 14.95, while normal to date is 24. Red Bluff has 10.64, while its normal is nearly 14 inches. The precipitation at San Jose totals 8.82, which is practically normal. Fresno is somewhat above normal with a precipitation of 6.5, as against 5.1 normal. The heaviest precipitation reported for the storm was at Eagle Rock, near the city of Los Angeles, 3.72. At Los Angeles the total for the storm was 2.77, which makes for the season to date 13.57. Santa Paula, storm 2.60, for season 15.27. Porterville, for storm, .44, for season 6.87. Hemet, 3.20, for season 19.78. Last year's precipitation at this date was only 4.10. Redlands, for storm 2.85, for season 17.98. Oxnard, storm 1.40, season 1.49. Bakersfield, storm .68, season 4.68. Santa Barbara, storm 2.6, season 12.33. Escondido, storm 2.60, season 20.46. San Diego, storm 1.14, season 14.66. Santa Ana, storm 1.80, season 11.34.

Riverside, 2.08, season 14.51. Pomona, 2.35, season 16.05.

THE CONFERENCE

The agricultural conference is ended. "It accomplished much"; "It accomplished little"; "It accomplished nothing." "It played into the hands of the railroads," are some of the expressions made by those observing the proceedings at their different slants. At this distance and this early date it appears that the greatest result of the conference is the publicity which has been given to the fact that the farmer has been bearing the brunt of reconstruction, with labor, with capital, with transportation and with marketing interests practically all working against him. And there is a practically unanimous suggestion that "something must be done."

One resolution, which partisans regretted seeing passed, was that endorsing the agricultural bloc. Some politicians fear this will mean the wrecking, or at least crippling, of the two old parties, and the organization of a new one. As a rule, however, the impression seems to be that it is simply an instrument temporarily used to save the agricultural industry.

President J. R. Howard of the farm bureau appears to be entirely satisfied with the accomplishments of the conference, and from a statement which he issued, as reported by the Associated Press, we quote:

"The farm bureau will undertake to organize all the farmers and unite them into strong commodity marketing associations which will improve the distribution of food to the lasting benefit of both consumer and producer. We want to bring the eater and the grower closer together."

"The agricultural conference will go down into history as the most far reaching conference of farmers ever held. The topmost feature, of course, was the address of the President of the United States and the commitments which it contained of the administration's attitude toward agriculture."

"Probably no chief executive of the nation has previously indicated so deep and intelligent an interest in the farmers' affairs. President Harding recognized the bad state of agriculture, stressed the outstanding importance of agriculture in our national life; showed that the farmer must have a credit system adapted to his needs, asserted that lasting improvement is to come only through the development of cooperative marketing, favored a scientific limitation of production and pointed out the dignity of the profession."

"The cooperative marketing movement as fostered by the American Farm Bureau Federation is a protest expressed in action against excess margins and distributive costs. It is no new thing. It has been carried on successfully in Europe for hundreds of years. Within less than 50 years, Denmark through cooperative marketing has reduced distribution costs so that the producers receive 72 cents of the consumers' dollar, more than twice as much as we get here, and through cooperative marketing has rebuilt her entire national prosperity."

"Secretary Wallace comes out of the conference with his hands greatly strengthened to perform a real and definite service for agriculture and the nation. Particularly notable in the indorsements of the conference is the farmers' demand for early completion of the St. Lawrence deep waterway, the development of the Muscle Shoals by Henry Ford, the building of a credit machine adapted to a farm turnover at reasonable rates of interest and the farmers' demand that both capital and labor must share alike in the readjustments which have already hit agriculture."

"The indorsement by the conference of the agricultural bloc is significant."

"The conference would probably never have been possible except for the work of the congressional joint commission of agricultural inquiry under the agricultural leadership of Chairman Sydney Anderson. To President Harding, Secretary Wallace and Chairman Anderson the farmers of America are today rendering a sincere vote of thanks for an opportunity to present their case to the nation and to seek a just and lasting remedy for the benefit of both agriculture and the nation."

California Cultivator

Vol. LVIII, No. 5

Los Angeles, February 4, 1922

One Dollar Yearly

WITH the approach of the planting season the prospective fruit grower is inclined to wish that he might look into the future for guidance in the selection of varieties. What kind of fruit will pay best when his acreage reaches the bearing age? It is a serious question to decide and one which should not be gone into blindly, yet few growers have the time or money to investigate conditions relating to market transportation and the extent of non-bearing acreage already in the state. With some fruits there is also danger of foreign competition. Perhaps the fruit grower is the only business man who would think of entering a new field without adequate information on every phase of the proposed enterprise.

Someone has said that a safe rule to follow is to plant only those fruits others are neglecting. This rule is based on the idea that everything which goes up must come down, and to a certain extent this has worked out in a general way with almost all fruits in California. Judgment must be used to avoid making serious mistakes. Most fruits are somewhat particular as to soil requirements and others must be planted in as nearly frost free districts as possible. Nearness to market is also a controlling factor. Prevalence of disease in a district may be the reason for lack of planting in that district of certain fruits.

This may be illustrated by the fact that no one thinks now of planting pears in the San Joaquin Valley in spite of the fact that some years ago some districts in the valley were noted for their fine Bartletts. When the industry was in a very flourishing condition pear blight made its appearance and soon ruined the future prospects for that fruit in the valley.

In looking over the field of prospects for future planting nearly everyone gives grapes at least some thought. That this thought has been serious in many cases is evidenced by the tremendous increase in acreage of both the table and raisin varieties in all districts where there is a promise of success.

Cautious people are now wondering

Why Not Peaches?

By Fred K. Howard

if grape production will not be overdone even before the new acreage already planted comes into bearing. But for the frost it is probable that the shipping season just past would have been a disastrous one for the table grape men because of a shortage of refrigerator cars. This condition was brought about by the great tonnage of wine grapes sent to eastern markets. The railroads are probably justified in not rapidly increasing their building program until they are more certain that wine grape shipping is to be permanent.

In referring to the fruit grower as a business man, it was with the idea of bringing out the point that in California growers are business men. If they had not been business men of the highest order the 1921 season would have been as disastrous to them as it was to almost all producers in other sections of the nation. Nearly every fruit is now marketed by organized growers, and it is wise to confine planting to those fruits which are protected by cooperative marketing organizations or where such an organization is in the development stage.

It is only through organization that the growers of California can hope to continue to produce fruit profitably, since standardization is essential to continued success and intelligent national advertising with the proper distribution of the crop is also necessary.

After considering all these points carefully we come to the question: "Why not plant peaches?" This is perhaps one fruit which will stand the application of the tests mentioned above. There is very little peach acreage being planted in the state. In the great peach growing districts there are no serious diseases or insect pests which would cause one to hesitate or which might wipe out the industry. Peaches are being handled very successfully by one of the largest cooperative organizations of the state. The California Peach and Fig Growers

have been exceptionally successful in applying a new process of defuzzing the fruit. The result of this process on the trade demand has been one of the wonders of the age. Only recently it was the comment of the manager of the association that all grades of peaches would be entirely cleaned up long before the new crop comes on. Added to this, more than 3000 acres of peaches have been dug up in the past year. This destruction of trees was not due to poor prices but to non-productive trees.

Until the peach men were organized a few years ago this fruit sold for less than the cost of production and consequently many orchards were badly neglected. Fertilizers were almost unknown and with the bulk of the peach acreage in light sandy soils these soon became depleted. Lack of organic matter also had its effect and many of the orchards suffered for water. Today most of the remaining orchards are battle scarred relics of the troublesome unorganized past. Sunburned on most of the scaffold branches and the home of borers, these trees are doing their best to justify their existence by production of fruit in much larger quantities than we have a right to expect. This is a view of the peach industry of today. There are a few outstanding exceptions to this condition, and those growers who are fortunate in having good trees are not thinking of going out of the business for some time. So much for the drying peach.

The canning industry has had its ups and downs but on the whole quality fruit has been justly rewarded, and with the advent of a new canning peach cooperative marketing organization, which is now practically an assured success, the future seems bright. Quality peaches whether of the drying or canning kind will not have a hard time finding consumers for a long time, and the grower who recognizes this condition now is sure

to reap a rich harvest. Peach soils are plentiful, but we should not expect the greatest measure of success unless all conditions are right for production. Level land, with plenty of water, an intelligent fertilization program which should include green manuring, spraying at least twice a year and a continuous fight against red spider throughout the summer are necessities.

The natural question when one has decided to grow peaches is that of the variety to grow. The best advice is to stick to the standard varieties unless there is a very good reason for doing otherwise. Some of these reasons may be found in the cling varieties. Canneries can run more efficiently if they have a long season and no exceptionally heavy peak load. If it is found that a district runs largely to a single variety such as Tuscans or Orange Clings find out what the local cannery advises and with their help it might be wise to select earlier or later ripening varieties to fill the gap.

Muir and Lovells are the standards in the freestone field, with the preference on the side of the Muir, while Elbertas are best for fresh shipping. Right here it might be added that it is not wise to try some of the varieties which are leaders in the East. The chances are that you could not get the trees by the quarantine officials because of the danger of peach yellows, a serious disease which has not yet reached California, consequently we have ruled that trees shall not be shipped into the state from most of the other peach growing districts. Probably you would be disappointed with the fruit if you did get it.

Use every care in the selection of nursery stock. Crown gall, an old enemy of the peach and other fruits, should not be tolerated, and every effort to get stock free from this serious disease will be well paid in the future.

The preference at the present time is toward peach roots, and if possible apricot roots should be avoided entirely in planting unless there is a very good reason for using them. The gopher is very fond of apricot roots, often being so fond of them that a few of these pests may ruin the orchard.

Why not plant peaches?

February in the Vegetable Garden

Southern California

By D. F. Reichard

THE spring planting season is at hand. The call of the great outdoors is everywhere. Follow the impulse. Get out the measures and the garden line and stakes. Lay off a garden plot or improve on the one already established. Put the spade fork in good and deep and rake it over till it is nice and fine. That is a good start.

What kind of a garden are we to have? A little plot in the backyard of a rented place from which we will move in a few months, or are we to establish a permanent garden in connection with that beautiful place—home?

For the temporary garden confine your plantings to quick maturing seeds and plants comprising cabbage, cauliflower and lettuce plants; carrot, beet, radish, spinach, lettuce, green onion, turnip and Canadian beans.

For the home garden we plan for more permanent things; we look into the future. We not only plan on stuff that comes to maturity and yields a crop this year but we want things that it requires two or three years to bring into a producing state, and then continue to yield for a number of years. In this group are asparagus, rhubarb, artichokes, berries, and fruit trees if space permits. The garden should be so planned that these items will be in a permanent location so that they may be cared for without interference of the annual stuff. The sides or boundaries are the preferred situation for these things. Plant them as soon as possible.

While it is a little early for the more tender vegetables such as beans, corn, cucumbers, melons and squash in most places, there are many warm slopes in Southern California where any or all of these may be put in with safety. If there is any doubt as to your particular location it is just as well that you plant only the hardier vegetables

during the first part of February. The hardy vegetables are beets, carrots, radish, turnips, parsnips, salsify, lettuce, onions, peas, cabbage, cauliflower, spinach, Swiss chard, kale and kohlrabi.

It is now time to start in hot beds or boxes that can be protected at night, tomato, egg plant, and pepper plants for setting out later.

For those who have a garden already started see that the growing stuff is thinned out and hoed to allow proper development.

Prune and spray all shrubs and trees while they are still dormant. The best dormant spray is lime-sulphur solution.

Northern California

By A. R. Gould

RECENTLY the vegetable grower has been hit severely by the weather, first the cold winds and then the frosts. However, as the

days grow longer and spring advances we must make another start and get busy again. Some crops must be replanted and the ground should be put into shape at once. In the preparation of the plots apply farmyard manure wherever possible. Where this is hard to secure you may use sulphate of ammonia or dried blood and bone meal and where you are dealing with heavy clay or adobe soils work in a sprinkle of lime. Deep trenching of the soil is very essential and will pay every time. Avoid waste of time and good seed by being thorough in garden preparation.

When making your garden plans see that your water is available and the pipes laid to the various plots as irrigation is a very important factor and means much to your success.

Lettuce

Sow White Paris Cos, Big Boston and Los Angeles this month and make successional sowings. Sow the seed in rows very thinly 18 inches apart. The

Agricultural News Notes of the Pacific Coast

Northern California

The Associated Chambers of Commerce of Alameda has passed strong resolutions condemning county division.

California communities are finding that municipal camping grounds pay in attracting settlers and purchasers of farms.

Officers of the Glenn County farm bureau are: President, W. H. Walker, Willows; vice-president, W. W. Foster, Butte City; secretary, Kirby Clark, Oriand.

The Squaw Hill bridge in Tehama County which has been under construction for more than a year, is now completed and will soon be thrown open to traffic.

The Pacific Fruit Express, owned jointly by the Union Pacific and Southern Pacific has asked for bids on 3,300 standard refrigerator cars to be delivered during 1922.

At the hog auction sale of the Tehama County farm bureau exchange, January 10, average price received by growers for the 218 head sold was 9½ cents; San Francisco price same day, 9 cents.

The Asparagus Growers' Association has chosen as its officers: President, W. C. Kesner, Ryde; vice president, J. W. Gardiner, Isleton; treasurer, John E. Brown, Walnut Grove; corresponding secretary, Signund J. Janss.

The Humboldt County farm bureau has elected officers for the coming year: Robert Fisher, Carlotta, president; L. T. Smith, Fortuna, vice-president; J. C. Mankin, Blue Lake, J. B. Sage, Fields Landing, James Jensen, Loleta, A. W. Gobie, Fortuna, directors.

Central California

Litigation has ended in the Raisin Association case. The association is allowed to continue in its present status.

The San Joaquin County farm bureau has filed complaint with the postmaster general on rural service out Lodi and Stockton.

A government experiment station is in course of construction at Shafter and will soon be ready for the government to take it over.

San Joaquin County farm bureau officers for 1922: President, L. K. Marshall; vice-president, L. L. Newton; directors-at-large, Mrs. Wm. Mikesei, M. E. Phillips, Amon Swank, and S. A. Shearer.

The Turlock Melon Growers' Association has been incorporated and temporary directors selected are: W. H. Reedy, W. A. Mason, H. A. Stammerjohan, Harry Alexander, A. C. Rapp and M. L. Pope.

Hog auction sales dates of California Farm Bureau Marketing Association: Modesto, February 1; Chowchilla, 2; Fresno, 3; Wasco, 4; Tulare, 7; Visalia, 8; Hanford, 9; Corcoran, 10; Merced, 14; Turlock, 15; Madera, 16; Fresno, 17; Bakersfield, 18; Tulare, 21; Visalia, 22; Hanford, 23; Merced, 24.

Ft. Romie Grange installed its new officers January 5. Officers are: Master, Lee Dudgeon; overseer, J. C. Whisman; lecturer, Attilio Binsacca; steward, Miss Katie Binsacca; chaplain, Mrs. Louise Whisman; treasurer, Mrs. Anabel Anderson; secretary, Mrs. Jennie Dudgeon; gate keeper, Jesse Moon; Ceres, Mars, Amanda Wright; Pomona, Mrs. Adelia Nelson; L. A. S., Miss Anna Binsacca.

Southern California

Tractor school at Santa Ana high school, January 30-February 4.

Giacomini Andreola, rancher of Satcoy, was gored to death by bull last week.

The Mutual Orange Distributors is planning to build a packing house at Garden Grove in Orange County.

L. J. Weishaar and S. S. Rogers of the state bureau of standardization are in Imperial Valley with Horticultural Commissioner Waite regarding the lettuce deal.

Ten thousand cryptolaemus Montouzieri were brought from the Whittier insectary and turned loose in citrus groves of Orange County last week to combat mealybug.

Five thousand sacks of beans were shipped from Hueneme, Ventura County, wharf one day last week. Last year's shipments from the same port amounted to 110,000 sacks.

During the latter part of February the agricultural service will conduct in Los Angeles County a series of field demonstrations on top working of deciduous fruits and walnuts. The most approved methods of grafting will be shown at these demonstrations.

W. C. Jacobsen, state superintendent of rodent control, is giving demonstrations in Los Angeles County. Those scheduled for the next three days are: February 4, 10 a. m., Lankershim, on A. P. Stockwell's place; 4, 2 p. m., Van Nuys, northwest corner Culvert Street and Sherman Way; 6, 10 a. m., Whittier, Union High School; 6, 2 p. m., La Canada, Searight & Johnson Ranch; 7, 10 a. m., Owensmouth, southeast corner Canoga and Sherman; 7, 2 p. m., San Fernando, Lemon Association at Old Mission.

The Coast and General

A very large showing of livestock is being made at the Southern Florida fair at Tampa this week.

A grapefruit juice factory at Bradentown, Florida, reports finding receptive market for all the juice it can offer.

The Kittitas County (Washington) Hercules Shorthorn Baby Beef Club has been organized by club boys and girls. The calves will be shown as prime steers at next fall's county fair and at the Western Royal Livestock Show at Spokane in November.

Washington state shipped 23,087 cars of apples between July and December 2, according to figures announced by the federal bureau of markets. The Wenatchee district shipped 10,776 cars, Yakima district 8,065, Spokane district 2,374, Walla Walla district 1,324 and White Salmon 548 cars.

The desert border of southern Pima County, Arizona, is being mapped, based on geographic charts and 10,000 photographs taken by military aviators. In general the work will include the country westward from Tucson to the Colorado River and south of Maricopa to the Mexican border, 220 miles long by 80 miles wide.

James H. Hulbert of Mount Vernon, Washington, has been appointed regent of Washington state college, succeeding the late Fred S. Stimson. Mr. Stimson's place as president of the Washington State Holstein-Friesian Association has been filled by succession of Vice President H. C. Davis and Judge Charles Carey, first vice president of the Pacific International Livestock Exposition, will assume Mr. Stimson's duties as president.

Planet Jr. hoes quicker and cleaner

A Planet Jr. wheel hoe makes light work of the kitchen garden. There's no vicious chopping and stabbing at tender, growing plants when you use this No. 12 Planet Jr. Double and Single Wheel Hoe Combined. Not only does it hoe closer to the row than you can safely work with the old hand hoe, but it does much more—and better—work than you can do in the old way. No. 12 straddles and hoes both sides of a row at once, sliding easily along as you walk. The sharp hoes clip weeds clean off below the surface, and leave a fine protective mulch. So easy to handle, a woman or boy can easily do the garden work, saving

man. labor for other more pressing farm work.

GRAFTING WALNUT TREES

(Continued from Page 121)

tight. Where clefts are made pour these full of hot wax after placing the scion.

When the stubs are cut at the proper place use a heavy butcher knife and mallet to make the clefts, placing the knife across the stub as if a chip one-half to five-eighths of an inch were to be split off. Then depress the handle of the knife to an angle of 30 to 45 degrees and split the edge down two and one-half or three inches, allowing the edge of the knife to reach the farther side of the stub but not cutting down on that side. Open the cleft with a steel wedge one-half inch wide and thickest on one edge, placing the thickest edge toward the outside and far enough from the bark to allow room for the scion. Trim the cleft in the stub so it will be smooth, using a sharp knife. Then cut the scion so it will fit perfectly and place it so the inner bark (cambium layer) of both will be on the same line or at least cross twice. Remove the wedge and put hot wax over all the cuts on both scion and stock at once. The work should be examined every three

Method of Tying Growing Grafts

Native black which has been grafted to Eureka. Note large stakes or supports which have been spiked to the tree and to which the scions as they have started to grow have been tied for support.

or four days until leaves are formed, and if threadlike cracks are found they should be covered with hot wax. Any cuts on the body of the tree should be covered with a coat of heavy mineral paint and the trunk and stubs should have a coat of whitewash. An excessive flow of sap for a week or two will kill the scions as the callus cannot form in water. This flow of sap can be controlled by boring one-quarter inch holes in the trunk of the tree near the ground. Bore one or two holes three or four inches deep and wait a few minutes to see the effect before boring more. Do not bore too many holes, as three or four will be sufficient to control the flow on the largest trees. These holes soon the callus over and do not damage the tree.

If the sap flow has damaged the wax covering wipe it off and cover again. The wax can be made of one pound beeswax, five pounds rosin, one tea-cup flaxseed oil and one ounce lamp black melted together. The object is to get a wax which is soft enough to be pliable without running in the hot weather. Be sure to get pure flaxseed oil as an oil that will not dry on exposure to the air will penetrate the bark and destroy the cambium, in that way killing the scions. The lamp black is added as coloring matter to show when all the cuts are covered. After the scions have made a foot of growth it will be necessary to nail laths to the stubs and on the tree in such a manner that the new growth can be trained in the desired direction. Care must be taken that the scions are not disturbed when nailing. Strong laths will be needed and can

The NEW Bean Turbine Pump

Here is an entirely new idea in turbine pump construction—new, in the sense that it has not been offered generally to the growers of the state, although during the past year and a half there have been nearly a hundred of them installed in the Santa Clara Valley and elsewhere, and they have surpassed our highest expectations in efficiency, economy, and freedom from trouble.

No Bearings Below the Surface

We have eliminated all the drive shaft bearings below the surface. (Note the diagram.) A radial thrust bearing in the head takes up all end thrust, and operates in an oil bath. Lubrication troubles are unknown because there are no under-surface bearings to lubricate.

Built for 6-Inch Wells and Up

No need to bore a new well, for this new Bean pump is suspended entirely from the top and can be put into your old well, regardless of its size, from six inches up. It can be had direct connected with motor, or for belt drive.

Send for Turbine Pump Bulletin — which tells you more about this improved Turbine pump. Also—ask for our catalog of horizontal pumps, if interested in this type.

THE AUTO-OILED AERMOTOR A Real Self-Oiling Windmill

Oil an Aermotor once a year and it is always
oiled. Every moving part is completely and fully
oiled. A constant stream of oil flows on every
bearing. The shafts run in oil. The double gears run in
oil in a tightly enclosed gear case. Friction and wear
are practically eliminated.

Any windmill which does not have the gears running in oil is only
half oiled. A modern windmill, like a modern automobile, must have
its gears enclosed and run in oil. Dry gears, exposed to dust, wear rapidly.
Dry bearings and dry gears cause friction and loss of power. The Aermotor
pumps in the lightest breeze because it is correctly designed and well
oiled. To get everlasting windmill satisfaction, buy the Aermotor.

Write today for Circular. **AERMOTOR CO.** Chicago Des Moines Minneapolis Oakland

2 miles west El Monte, Calif.

be made of Oregon pine, one inch by
two inches by eight feet long. These
will be needed two years before remov-
ing. Do not take off any of the sprouts
at first except those within a few
inches of the scions, but as the scions
increase in size the sprouts may be
thinned, and when the sprouts become
two feet long they should be headed
back but not removed entirely until
the next winter. Do not head back
any of the scions during the growing
season.

The grafting can be done at any
time after the middle of January, but
if only a few trees are to be grafted
it will be well to wait a month later
since there will be less time in which

they should be thinned out and some
used for transplanting to other plots
which must be well prepared with
manure. Cultivate between the rows
of the early varieties as they should
now be making considerable progress.
Onion sets may be planted out this
month also and will give a good crop
for fall.

Beets

Improved Globe and Detroit Dark
Red are very satisfactory types to
grow, and seed may be sown in rows
18 to 20 inches apart in fairly rich
soil. Sea Kale beet is grown for use
as spinach and will grow easily if kept

The Grafting Operation

The native black tree from which the top has just been cut. The split has just
been made in the short stub in the center. The angular wedge has been driven in
to spread the split apart for insertion of the scion which is being prepared with a
sharp knife in the hands of the operator.

they will require attention. The graft-
ing can be continued until the sap
begins to flow and causes the bark to
slip. Scions can be cut at any time
after the trees are dormant until the
bark begins to slip and the buds swell
and open. Scions should always be
kept in a cool damp place but not
where they will be wet. Damp saw-
dust inside a house is a suitable place.

It is not necessary that scions be cut
in advance and "cured" as it is some-
times termed. They can be kept two
months or can be cut and placed in
the tree at once with equal success.
Any wax that will adhere to the wood
without cracking or running and with-
out any free oil to soak into the bark
is equally good. Scions of mature
wood of the last year, whether one-
eighth or five-eighths of an inch in
diameter, are equally good when prop-
erly placed. One part of the twig from
which the scions are cut is as good
as another provided the wood is ma-
ture and the end buds are as good as
those on the side and vice versa.

The Illinois experiment station
made a series of experiments with
fruit trees to determine whether there
was a difference in propagating from
large or small buds or whether cut-
tings from different parts of the tree
had any influence on growth. The
conclusion was that all buds from
healthy wood were equally good, so far
as growth of trees was concerned, and
that there is no tangible basis for the
assumption that large scions are supe-
rior to small diameter scions for
purposes of propagation.

FEBRUARY IN THE VEGETABLE GARDEN IN NORTHERN CALIFORNIA

(Continued from Page 123)

soil should be rich and this crop will
require plenty of moisture.

Asparagus and Rhubarb

Established plots should have been
well dressed with manure and then
lightly dug. For new plantings secure
strong roots of Conover's Colossal
and Palmetto asparagus and Victoria
and Crimson Winter rhubarb, and set
in manured trench.

Onions

The main crop varieties sown sev-
eral weeks ago should be soon show-
ing through the ground, and as soon
as the seedlings are a few inches high

well supplied with water. Sow this
in rows at least two feet apart.

Turnips

Early Snowball and White Egg
should be sown for succession in rows
20 inches apart. They like a rich soil
and must not be allowed to dry out or
they will lose their tender qualities.

YUCCA MANUFACTURING CO.
1380 Willow St. Los Angeles, Cal.

Peas

Sowing of the main crop varieties may still be made, and the varieties we recommend are Alderman, Abundance, Stratagem, Little Marvel and Yorkshire Hero, all good croppers. These should be sown thinly in rows three feet apart. A warm hillside usually brings in early crops of peas but they must also be well supplied with moisture.

Radish

Sow Crimson Giant Forcing for succession on a rich soil in rows 12 inches apart.

Artichokes

These are the most popular and unfortunately the recent frosts in some districts have destroyed or severely in-

jured the plants. Young plants may usually be secured from the nurseryman and planted in rows four feet apart and at least that same distance in the row. The plots will require manure every year.

Raspberries

There is still time to plant these, and the plots should be well prepared with manure and a fence erected for the support of the canes. Deep trenching is essential and the canes should be planted in rows four feet apart and 18 inches apart in the row. As raspberries are somewhat surface rooting the canes should not be planted deep. When the canes get old they should be removed and new ones planted as every year many new suckers appear from the old stock and may be used for transplanting. Where the canes become too thick they must be thinned out to about four of the strongest.

Southern Arizona

By M. E. Bemis

FEBRUARY in the lower valleys of southern Arizona may be counted as a spring month. Frosts will continue more or less through the month and into March, but the sun begins to run higher and ordinarily we may expect considerable growth of plants. It is a time of increased activity among regular gardeners and a time for those who have not already begun the garden to get busy.

Most of the recommended plantings are just about the same as for January; Eclipse, Crosby's Egyptian, Extra Early Egyptian, Early Blood, Detroit Dark Red beets and Swiss chard. Danver's Half Long, Oxheart, Chantenay, and Improved Long Orange carrots. A recommended carrot for stock or rabbits is the White Belgian, purely a stock variety. Collards, kale and kohlrabi are in the program of the February gardener. Arizona Wonderful lettuce, or New York Market, of which it is in reality an improved variety, Iceberg, Denver Market, Early Prize Simpson, Prizehead, Big Boston and Improved Hanson are other varieties that might be planted. Prickly seeded, New Zealand, and Bloomsdale spinach; Purple Top Strap Leaved, Snowball, Rutabaga, Purple Top White Globe, White Egg, and Early White Dutch turnips may be planted this month. Onions that may be planted are Australian brown, Crystal White wax, Yellow Globe Danvers, Silverskin and Bermuda.

Potatoes are not grown extensively in Southern Arizona, although some good yields and good profits are made by experienced growers. A light soil is very desirable for success in potato growing, but it should be made very fertile. Plowing under some green crop is a good preparation. Irish potatoes should be planted early and will mature in June when prices are good and before the main crop of the potato growing sections has come on the market. Varieties that do well here are the Bliss Triumph, Early White Rose and Irish Cobbler. Peerless, Pink Ohio and Coconino Red are also splendid. Potatoes for best results should be planted in rows three feet apart and nine inches in the row, covering three or four inches deep.

The early bush squash is usually planted earlier than most similar vines. The early white bush scallop may be planted the latter part of the month, and unless very heavy frosts come some very early squash will be obtained. Squash of this variety is usually on the Phoenix markets before many people think that time for planting has come.

Sweet corn may be planted early. There are two native varieties of corn both good for early planting. These are the Pima and Papago. These are small eared quick maturing varieties that have long been grown by the Indians and have now been improved and are finding favor with truck gardeners as well as the home gardener. Adams Extra early, Country Gentleman, Golden Bantam, Oregon Evergreen and Stowell's Evergreen are all good. The field varieties of corn are better planted later.

The chief object in work is not to get more, but to be more. The building of a fine character is more credit to a man than the building of a prosperous business.

**THE POMONA****Duplex Plunger Deep Well Pumps**

are solving the pumping problems for many users during the period of low water levels. They will lift the water to the surface, and, if desired, deliver it to high elevations above ground and at lower power cost than any other system of pumping water.

Treatment of Frost Injured Trees

By Ernest Brauton

FARM ADVISER HODGSON of Los Angeles County had programmed before the recent cold snap a series of citrus pruning lectures and demonstrations based on orchard needs in normal years, but frost injury has changed the subject matter somewhat, for the growers demand the how and when to prune frozen trees. So that Mr. Hodgson begins his talks by saying: "Don't prune frost damaged trees now; for reasons that will be given later"; and then comes a preliminary talk on

How Trees Feed

"Trees feed upon about ten elements, six of which are taken from the soil. Three of these are considered essentials: Nitrogen, phosphorus and potash. Of these nitrogen is the most important, most deficient in soils, most necessary for proteins. One pound per tree per year must be present if the tree is to grow. Fifty per cent of the total of the tree is water

which comes from the soil. Forty-seven per cent is carbon which comes from the air. These are the two important elements of food, and the tree must have good intakes and balance of both or it suffers. Because of present injury and dormancy you may plow deeply close to the trees, even though you break many surface roots. Defoliated trees should be whitewashed to protect from sunburn, but it would be as well to make the whitewash a Bordeaux so it will also prove a disinfectant. From close observation we find trees pruned in November and December were more heavily injured through freezing than those pruned in January. Therefore we recommend now, as we have in the past, that pruning of citrus be done during January and February.

The 1913 freeze showed that the extent of injury was not revealed in some cases for three or four months following the freeze. Growers are therefore advised to delay pruning injured wood for four or five months.

Observations made on injured trees pruned in various ways showed that the unpruned trees were in practically every case better off at the end of the first season than trees which had been pruned. In most districts the soil is amply supplied with moisture. If rains do not occur within the next month or six weeks it may be advisable to irrigate. The soil should not be allowed to become dry, and growers are advised to watch the soil moisture conditions and to irrigate in case this becomes necessary before further rains.

The use of chemical fertilizers, particularly quickly available nitrogen such as ammonium sulphate and nitrate of soda, is not recommended for frost injured trees. On the other hand, growers are advised to continue the application of organic materials such as barnyard manure, bean straw, alfalfa hay and other materials of this sort.

Treatment of Young Trees

In many districts it is apparent that trees under the age of six years have been badly injured in the way of splitting and cracking of the bark on the trunks. In some cases it is doubtful whether any treatment which may be applied will be productive of beneficial results. The recommendation of the agricultural extension service is to immediately bind up the trunks, using strong cord such as binder's twine. The binding should begin a few inches below the signs of cracking and should extend well above all indications of splitting. In some cases it will be necessary to start at the surface of the ground and bind the trunks clear up to the crotch. The binding should be done in the form of a spiral with the strands a half inch or so apart and the bark should be pulled in tightly. The binding should be allowed to remain for two months or thereabouts. Extensive observations made following the 1913 freeze have indicated that this is the only method of treatment which gave any substantial results.

The use of grafting wax, asphaltum paint or other preparations for sealing up the wounds is not recommended, it having been found that sealing up the wounds with these materials enclosed fermenting sap, the result being molding and decay. Narrow strips of cloth may be substituted for cord, but the important matter is to pull the bark in tightly against the trunk of the tree. Within two or three months the wrapping should be removed at which time the dead bark should be thoroughly cleaned away and the wound's surface treated either with Bordeaux paste or with corrosive sublimate 1 to 1,000. Later in the season the wounds should be covered over with asphaltum paint or some other good wound covering. It is important that the binding be done immediately if beneficial results are to be secured. This treatment cannot be guaranteed to give results but is the only method which can be recommended as calculated to benefit the trees. Where the bark has not been killed this treatment will prevent further splitting and in many cases will save a considerable part of the bark area. Where the bark has been killed and this cannot be ascertained at the present time, no treatment will prove beneficial. The recommendation, however, is to immediately bind all trees showing signs of splitting. Where the bark has been ever, killed in most cases it will still be possible to rehabilitate the trees, either by permitting the growth of sprouts and inarching these above the point of injury, or by rebudding new sprouts and forming entirely new heads to the trees.

Several growers with whom the writer talked and who experienced orchard injury in 1913 claim that it pays to prune twice, taking away the dead foliage as soon as dry or it and the dried twigs will draw moisture from the living. One case was cited where but one man in a district so pruned his lemon grove. His trees most quickly recovered, having green leaves before any other orchard surrounding and the next crop was the best and heaviest in the neighborhood. Many prefer to give a preliminary pruning at once to avoid the untidy and neglected appearance consequent to frost damage. So it would appear that if an orchard owner so wishes he may prune now or soon without injury resulting, even though no fundamental gain accrue.

KIRKMAN NURSERIES

Established in California in 1888

RELIABLE TREES AND VINES

are essential to the great fruit industries of the Pacific Coast.

Our experience has been gained by 32 years of progression in the nursery and orchard business in California.

Reservations are now being made for future deliveries.

HOT WATER TREATMENT OF GRAPE CUTTINGS

By D. B. Mackie, State Department of Agriculture

Considerable complaint has been made of the regulations of the California department of agriculture during the last year's shipping season, making treatment by hot water process mandatory. While it is true that considerable loss was entailed in this regard, a survey of the apparatus used leads to the conclusion that by far the greater proportion occurred in application of the treatment.

A recent investigation by the California department of agriculture has developed the fact that standardization of the types of outfits used for this purpose is one of the first requisites of any attempt to prevent a recurrence of last season's losses. Preliminary to the regulations which the department will issue shortly covering this subject it is desired to convey the following caution:

The use of direct fired outfits renders the temperature control an exceedingly difficult matter, one fraught with grave possibilities for damage to the vines by overheating and a great reduction in the safety factor from a standpoint of destroying possible phylloxera infestations.

What is perhaps the second greatest cause for mortality among dipped vines and which has heretofore been given little or no consideration, comes from the lack of proper cooling after dipping. As a result of a lack of proper handling in this regard, vines are in a condition which is decidedly favorable to excessive drying out. There is a well defined equation in the above regard which is governed first, by the difference between the temperature of the vine and that of the atmosphere; second, by the velocity of the air currents to which the vines are exposed, and last, by the amount of exposed surface. While there are other considerations involved the above represents those of major importance.

To reduce danger from this source to a minimum vines should immediately after removal from heating tanks be cooled by hosing or by submerging in cold water until atmospheric temperature is reached.

AVOCADOS TO AFRICA

The R. M. Teague Nurseries of San Dimas made a shipment of avocado trees to South Africa on September 24, 1921, by express. Shipment arrived in London October 17, from there to Pretoria, South Africa, arriving on November 22, practically 60 days en route. The customer writes that they were very much pleased as all of the trees arrived in good condition and commended the nursery on their careful method of packing.

PEAR GROWERS ANNUAL

At the annual meeting of the California Pear Growers Association at San Francisco on January 17 possibilities of shipping fresh pears by water to Atlantic ports was taken up and will be thoroughly investigated before the next season. Last year's officers were all reelected. The membership is 1,048 as against 589 last year.

MAKING GRAPE CUTTINGS

Grape cuttings are made from well ripened wood of the past season, usually about eight inches in length. Most propagators prefer to cut the lower end just below a bud and the upper end one or two inches above a bud. They may be tied in bundles of 50 or 100 by means of twisted willow twigs and stored and well callused. Place them in a pit with the butt end up and three inches of soil over them.

These Four Lee Tires delivered 26 months continuous service

LEE Puncture Proof Tires

Every week day for more than two years (26 months) this set of Lee Puncture-proof Tires carried J. L. Hodges of Spray, N. C. to and from his work, without a puncture, blowout or other trouble.

LEE

LEE'S Smile at Miles

IN the experience of Mr. Hodges there is food for serious thought by every farmer in the land. For it is just such continuous service that is required of every farm owned automobile, truck and general service car, if it is to deliver full return on the investment it represents.

Lee Puncture-proof tires are unlike all other pneumatics in that they do away entirely with the annoyance, delay and expense of punctures.

While the first cost of Lee Puncture-proofs is a trifle higher than Lee Regular Fabric or Cord tires, they are by no means a "rich man's tire." It is the man who must secure maximum service per dollar of tire investment who most appreciates Lee Puncture-proofs.

The added service, protection and mileage assured by the Lee exclusive puncture-proof feature, make this the most economical and satisfactory pneumatic made, for any car used where road hardships are most severe and uninterrupted performance most desirable.

All types of Lee tires are exceptionally well made, from best materials. All are quality guaranteed against fault or flaw. But the Lee Puncture-proof is the only pneumatic in the world that carries a cash-refund guarantee against puncture.

The Lee Line of Pneumatic Tires and Government Specification Grey Tubes is represented by responsible dealers, in every locality.

Questions and Answers

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

June Drop

Referring to comment on June drop in this department of the Cultivator of January 21, R. R. Snowden writes: "I have repeatedly pointed out that the effect of one factor is frequently attributed to another. Your Porterville correspondent (January 21 issue) sprayed his orange trees with lime-sulphur. It is presumable the spray used in April is the same used later. In your issue of August 10, 1918, I called attention to an orange grove in the Porterville district that after receiving an application of gypsum held and matured a 65 per cent crop while neighboring groves matured but a 15 per cent crop. I believe the lime and sulphur in soluble form applied to the soil may have had much to do with the prevention of dropping in Mr. Reynolds' orchard."

Neff Walnut

What kind of nut had we better plant here (Riverside)? Have three that were bought for Neff's four or five years ago. They have done well, bear a nut almost as large again as the Placentia. It is shaped like a butternut with hard shell. Is that true to name? I hear some discouraging remarks about the Neff. Are they well founded?—Sulphure, Riverside.

If the location is one which will not be subject to late spring frosts any of the standard varieties should do well. If late frosts are to be avoided it will be best to plant the Eureka as it comes into leaf a few weeks later than some of the early varieties. The Eureka is, however, not a prolific producer in its early years in this part of the state. You likely have the true Neff walnut and we do not think the remarks you may have heard will cause you any uneasiness after the trees come into bearing.—J. B. N.

Paying for Paper

I have been taking a paper for some time. I subscribed for three months, paying in advance, and the paper has continued to come after the subscription has expired. Can the paper collect for the time sent after I subscribed for it? I have told them to stop the paper but could not prove it as there was no witness.—Subscriber, Gridley.

Legally a paper may be able to force collection so long as the paper is accepted from the postman or taken from the post office. Practically there are very few papers nowadays that force collection because of this feature of postal regulations. It is possibly an error when a paper continues after it is ordered stopped. If it continues to come the proper procedure is to notify the postman that the paper is refused. The postmaster then sends official notice to the publication.

Killing Poison Oak

What will kill the roots of poison oak? All of the growth and most of the roots have been removed, but want to prevent new shoots coming up.—Subscriber, Watsonville.

The best method is cultivating so often that the leaves are prevented from forming and the plant will soon die. If, however, they are allowed to grow and form leaves a new starch is formed in the roots and life is prolonged. If in alfalfa or other field which is not cultivated we know of no better way than the repeated use of the hoe. This will be much cheaper than trying to kill with chemicals.

Purifying Water

What will sweeten water in windmill water tank? It is of redwood. We pump only about once a month and between pumpings a green growth forms in the water, a kind of moss, which makes the water taste unpleasant. I know there is something that can be placed in water and left there to sweeten it, but do not know just what, or the proportion to use. The tank holds 1,500 gallons.—Subscriber, Watsonville.

We know of no way of removing the tannin taste of the redwood excepting filling and after allowing the tank to remain full for a few days drawing off and refilling. There will not be many renewals required until this redwood taste is removed. In the matter of algae forming this is seldom a serious factor where the tank is covered and the light kept out. But if it is open at top and sunshine is allowed to enter the best protection is the use of small quantity of sulphate of copper. This does not add to the attractiveness of the water and the cover is a much more satisfactory protection. Do not use of the copper sulphate more than one ounce for every 30,000 gallons or 4,000 cubic feet of water. Probably one ounce to 75,000 gallons will be sufficient. The sulphate should be dissolved in a small quantity of water before adding to the tank or one may put it in a small bag and suspend in the tank near the surface. If thrown into the tank loose it will fall to the bottom and remain undissolved. Another purifier for water seriously contaminated with bacteria is chloride or hypochlorite of lime which are both most powerful germicides. Use not more than one part of the chemical to 7,000 parts of water.

Blood for Fertilizer

I would like to know through your columns if pure blood from slaughterhouse is good for three year old grape vines, to be used as a fertilizer. Should it be put near roots or on top of ground?—Subscriber, Modesto.

The use of the blood would be an excellent idea. It is not a complete fertilizer, of course, containing practically nothing but nitrogen, but the nitrogen is in one of the best forms to use for building up the soil. It is especially valuable where a sandy or loamy soil is supplied with sufficient organic matter to permit of bacterial action, or, in other words, the nitrifying of the soil. It is probable it would be well to supplement the use of the blood by the use of bone meal or, rather, bone reduced to the very fine consistency of flour. This would supply the phosphoric acid, and presumably your soil is abundantly supplied with potash.

Sow Bugs

Is there any way to get rid of sow bugs in sheds during rainy weather?—Subscriber, Willowbrook.

Sow bugs may be controlled by cleaning up rubbish and scattering a liberal portion of air slaked lime. Where this can not be done they may be readily poisoned by the use of paris green spread on slices of raw potatoes, carrots or other vegetables and laid where the pests are troublesome. If the case is serious one may cover with tarpaulin or tent and fumigate with hydrocyanic acid gas. Use greatest care in handling of the gas, which is deadly to humans.

Japanese Walnuts

We have received notice from several subscribers that there are several trees of Japanese walnuts growing in this state large enough to produce seed.

Wire Worms

Can you tell me what is the matter with my carnation roots? The plants die and I find the roots infested with little wire worms. Are they the cause of the plants dying, or is it bad drainage? What can be done to remedy it? Will they affect other plants?—Subscriber, National City.

This is certainly a serious infestation of wire worms and they are proceeding to get a good living off the roots of the carnations, which appear to be very old plants. It is hardly probable that the lands are valuable enough to sterilize by the use of steam heat or bisulphide of carbon. However, by letting the ground go entirely barren with clean culture for a year or so the number of wire worms would be greatly reduced. But this is impossible with the man who has limited acreage and wants to work every foot of it every year. Some help may be had by using potato ball Ventura County lima bean section

have succeeded in raising beans on lands so seriously infested with wire worms that seed has been destroyed before plant became established. Their procedure has been to use pieces of potatoes buried in the soil near to the seed just planted. The field is inspected daily, a man going rapidly from bait to bait, which has been marked with stake and bright colored marker. The bait is carefully lifted from its hiding place in the soil and is often found to be covered with many of the wire worms. Shake the worms from the bait into a bucket containing small quantity of oil. The bait is replaced in the soil, the inspector passes to the next, and so on. Plowing at this period, or better still, a month earlier, kills many of the pests.

Strawberries for Chico

What kinds of strawberries are the best adapted to this section of the country? Some say the Banner is the best, others the Progressive, still others the Oregon Everbearers, the Patagones or Magoons, and one man told us that he would not bother with anything else than the Carolina and told us that you could tell us all about them. Can you tell us where we can get the Progressive plants?—Subscriber, Chico.

In the Florin, Sacramento County, district, a section quite comparable to Chico, the commercial favorites are the Oregon, Dollar, and Jessie. The Carolina is rapidly becoming a favorite but we do not know as to its behavior about Chico. The Progressive is at present a leader in some eastern states and is widely advertised there but of its California value we have no report. We believe any northern dealer advertising in the Cultivator can supply the plants.

Citrus or Walnuts

I have 35 acres which I am now putting under irrigation with the intention of planting an orchard and intercropping until the trees grow too big. This is suitable land for either citrus or walnuts. Will you kindly advise me where I can secure figures as to relative returns on lemons, oranges and walnuts and the present proportion of young unproducing orchards to those in bearing. I should also appreciate your own opinion as to what sort of an orchard to plant.—Subscriber, Carpinteria.

Relative returns from different varieties of fruits are sometimes misleading as factors entering into production may have been overlooked. The writer has known an orchard since it was planted that has had uniformly good treatment and has given good results. There are both walnuts and oranges on this tract. The walnuts are about 16 years old and the oranges were planted nine years ago. The soil is a good loam with the walnuts on the heavier part of the tract. The walnut crop of 1920 sold for \$545 per acre gross, and the orange crop of that year for \$487 per acre gross. The walnut crop of 1921 sold for \$490 per acre gross, though the price per pound was higher, and the orange crop was \$698 per acre gross. The only noticeable difference was that the walnuts were not irrigated in the last of August or first of September of 1920 and dropped their leaves early, showing that the buds and wood had not been fully matured for the crop of 1921. The oranges had a plentiful supply of water at all times and the walnuts have had plenty of water this past season as the leaves were on the trees until the late heavy winds. The cost of growing oranges is considerably more per acre than that of walnuts and walnuts have not been subject to such violent fluctuations of price as has been the case with oranges. Intercropping can be done without injury to the trees provided it is not continued too long and there is an abundant water supply. It must also be remembered that additional fertilizers equal to the amount taken out by the intercrops must be put on the land, and in no case must the water be withheld from the trees to grow the annual crops which may be planted.—J. B. N.

The saying that "haste makes waste" is old, but the truth it carries is as fresh as ever. A little delay often opens a wiser and safer way.

DURABILITY

A CASE TRACTOR QUALITY

Case Kerosene Tractors have demonstrated remarkable efficiency and economy in every test in which they have been entered. The following are a few of many exceptional records, made in the world's most important tractor tests:

Lincoln Tractor Trials, Lincoln, England—10-18 Case Tractor won Gold Medal and 20 pounds in Class I.
Zaragoza, Spain—15-27 Case Tractor and Grand Detour Plow won First Prize in Economy.
Benha, Egypt—15-27 Case Tractor and Grand Detour Plow won All First Honors.
France—In six different tests held under the auspices of French Agricultural Committees 10-18 and 15-27 Case Tractors with Grand Detour Plows won Highest Awards, Gold Medals and First Prizes.

Operating economy is important but rugged durability is even more important. Ruggedness, the ability to stand up under the severest conditions and perform the most strenuous work is an essential quality of every Case Tractor. This quality is the result of a highly developed design and superior construction and is the reason why every Case Tractor may be relied upon to give dependable and efficient service year after year.

The Motor. All Case motors are of the heavy duty, four cylinder, valve-in-head type, built to use kerosene successfully. Developing power well above their rating, they are never overtaxed on their rated loads—another reason for durability.

The Drive. The motor is mounted crosswise on a rigid frame, permitting the use of a few simple spur gears—the most efficient and durable type of drive. All gears and shafts are made of special alloy or carbon steel. The gears are all machine cut, heat treated and run in oil. Anti-friction bearings, held in permanent alignment by the rigid frame, carry all shafts and axles.

Protection. All working parts are enclosed in dust and dirt-proof housings. Gears, bearings and motor parts are all completely enclosed and thoroughly lubricated. A Case patented air washer prolongs the life of the motor and adds to its efficiency.

These dependable, durable Case Tractors are made in three sizes—10-18, 15-27 and 22-40, so as to meet the requirements of any farm.

We also manufacture Grand Detour mouldboard plows, disk plows and tandem disk harrows in various sizes for use with Case Tractors.

Illustrated catalogues explaining the superior qualities of our Tractors, Plows and Harrows mailed upon request.

The Cultivator Patterns

3808. Boys' Suit—Cut in 4 sizes: 2, 3, 4 and 5 years. A 4 year size will require 3 yards of 27 inch material. Price 10 cents.

3775. Misses' Dress—Cut in 3 sizes: 16, 18 and 20 years. An 18 year size requires 4 yards of 54 inch material. The width of the skirt at the foot is about 2 1/2 yards. Price 10 cents.

3452. Girls' Dress—Cut in 4 sizes: 4, 6, 8 and 10 years. An 8 year size will require 3 1/2 yards of 36 inch material. Price 10 cents.

3344. Dress for Work or Porch Wear—Cut in 7 sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. A 38 inch size requires 6 yards of 36 inch material. The skirt with plaits extended measures about 1 1/2 yards. Price 10 cents.

3802. Child's Dress—Cut in 4 sizes: 2, 3, 4 and 5 years. A 4 year size requires 3 yards of 27 inch material. Price 10 cents.

3796-3798. A Pleasing Dinner Dress—Waist 3796 cut in 6 sizes: 34, 36, 38, 40, 42 and 44 inches bust measure. Skirt 3798 cut in 6 sizes: 24, 26, 28, 30, 32 and 34 inches waist measure. To make the dress for a medium size as illustrated in the large view will require 7 1/2 yards of 27 inch material. The width of the skirt at the foot is about 2 yards. Two separate patterns, 10 cents for each pattern.

3754. Girls' Dress—Cut in 4 sizes: 8, 10, 12 and 14 years. A 12 year size will require 3 1/2 yards of 36 inch material. Price 10 cents.

3805. A Popular Apron and Cap Set—Cut in 4 sizes: Small, medium, large and extra large. A medium size requires 3 1/2 yards of 36 inch material for the apron, and 3/4 yard of 30 inch or wider material for the cap. Price 10 cents.

PRICE OF ANY OF THE ABOVE PATTERNS 10 CENTS EACH

HOW TO ORDER PATTERNS
Write your name and address plainly in full, give correct number and size of each pattern you want, and send 10 cents in coin or (1 or 2 cents) stamps for each number. In order to furnish our readers with the very best NEW YORK styles, all patterns ordered are filled in NEW YORK. Do not expect patterns under **Two Weeks** from date of order.

CATALOGUE NOTICE

Send 12c in silver or stamps for our Up To Date Spring and Summer 1922 Catalogue, containing over 500 designs of Ladies', Misses' and Children's Patterns, a concise and comprehensive article on dressmaking, also some points for the needle (illustrating 30 of the various simple stitches) all valuable to the home dressmaker. Also colored plates.

PATTERN DEPARTMENT

California Cultivator Los Angeles

SHOES

I'll tell you it's a problem when a youngster's nine years old To keep his feet in leather and to keep him heeled and soled; Just about the time I fancy I've some money I can use, His mother comes and tells me that he needs a pair of shoes.

Now I can wear a pair of shoes for several months or more. But Bud, it seems, is working for the man who keeps the store, And the rascal seems to fancy that his duty is to show How fast a healthy, rugged boy can wreck a leather toe.

But shoes are made for romping in, for climbing and for fun, For kicking bricks, and empty cans, and I am not the one To make him walk sedately in the way that grown-ups do— There's time enough for that, I say, when all his boyhood's through.

So let him wreck them, heels and toes, And scuff their soles away; I'll not begrudge the bill for shoes that I'm compelled to pay, For I rejoice that it's my lot, when mother breaks the news, To have a healthy, roguish boy who's always needing shoes.

—Edgar A. Guest.

UPSTAIRS

By Leon W. Dean in Forward

HE cabin stood on the bank of an ice bound mountain stream. At its rear rose a high, wooded hill. Across the stream rose another hill. On every side stretched miles of forest, a world of trees that creaked in the intense cold and were buried to their lower limbs in treacherous depths of snow.

Down into the valley between the hills Rael Cilne had stumbled, his fingers nipped with the frost, his eyes blinded by the swirling snow. He sought nothing but such slight shelter from the wind as the hollow might afford, and rest from his ceaseless battle against the elements. So long had been the struggle that distance and time had come to mean little to him. With numbed body and numbing brain he merely plodded on, warding off the end as long as he might.

He floundered, fell, and lay quite still. After a time he moved, as one might move in a dream, almost unconscious of the will that still flickered feebly and urged him on. He floundered first to his knees and then to his feet, and would have gone helplessly on, had his eyes not chanced to light on the cabin, where it stood half smothered in snow.

He stood still and looked at it dully. There was no elation in his gaze, rather a dumb questioning. It took some time for his clouding brain to understand its significance, to realize that here perhaps was safety. When the fact did penetrate to his inner consciousness and was grasped and held, it quickened all his being with new strength and hope. It also brought a tantalizing mistrust and fear, for every few seconds the little building would be lost to sight in a curtain of intervening snow, and at such times he doubted its presence there.

Here was possible shelter, and toward it he groped his way. In time his hands reached out for it and touched it and he found it for what it was—the little cabin between the hills. Who had built it, or why, he neither knew nor cared. It was there, and the great business of his life was to gain admittance.

At first he thought the structure was built of logs. A closer examination showed that instead of logs, it was made of rough slabs, hewn off and nailed into place with the bark still on. There were windows, but heavy shutters of the same material securely closed them in. It was a solid little place, evidently meant to defy the various vicissitudes of wilderness existence, and as the boy viewed it, now somewhat protected by it from the storm, his heart misgave him. In his weakened condition, could he ever force an entrance? A hatchet swung at his belt, but even that would be a feeble instrument when wielded by an arm sapped of its strength by cold and exhaustion.

Rounding a corner, he came upon a porch, and in trying to reach it sank to his waist in a welter of snow. Unable to extricate himself, it seemed for a moment as if he might perish at

the very door of deliverance, but his seeking hands found a railing and by its help he was able to flounder free.

He might have hoped for some reward of his labor, but so far as he could see there was none. Door and windows there were, but these must either be pried or pounded open. He was about to attack the former, when he noticed the shutters over the nearest window were held in place by hinges. If he could chop the hinges free, the rest should be easy.

Ordinarily the thrill of a new hope would have heartened and revived Rael, nerving him to his task, but the sources of his vitality seemed to have been drained, and it was with clumsy, weak arms that he set to work. The building and the hills, however, protected him from the full blast of the storm, and if his strength did not flow higher, neither did it ebb. Hacking away patiently, he freed first one hinge and then the other. The shutter now fell away from its niche, and hung by only the inside hook which had it shut.

Rael tried to raise the sash, but could not, so crashed in the glass and followed it. Once inside, he looked about him, for fire and food were almost as essential to his needs as was shelter. It was a small room in which he found himself, scantily furnished, but containing that one thing for which he looked most eagerly—a stove. He had with him matches and a little food. And as if waiting some forlorn traveler like himself, there was wood piled ready beneath the hearth.

Fortunately, Rael's hands and face were not so badly frosted as to cause him much trouble beyond the terrible ache, as snow and heat restored the circulation.

By the time he had worked the frost out, and was sufficiently over the pain of it to care for anything else, his pot of tea was ready, and, with a small

Oil Light Beats Electric or Gas Burns 94% Air

A new oil lamp that gives an amazingly brilliant, soft, white light, even better than gas or electricity, has been tested by the U. S. Government and 35 leading universities and found to be superior to 10 ordinary oil lamps. It burns without odor, smoke or noise—no pumping up, is simple, clean, safe. Burns 94% air and 6% common kerosene (coal-oil).

The inventor, V. S. Johnson, 31 N. Fifth St., Portland, Ore., is offering to send a lamp on 10 day's FREE trial, or even to give one FREE to the first user in each locality who will help him introduce it. Write him today for full particulars. Also ask him to explain how you can get the agency, and without experience or money make \$250 to \$500 per month.

BOYER PRESSURE COOKER

The cooking utensil of 100 uses. Saves fuel and cooks food more rapidly. Ideal for home, hotel or restaurant. Write TODAY for our free illustrated booklet showing our complete line of copper ware. It is sent by first class mail.

GHIRARDELLI'S
Ground CHOCOLATE

Last Spoonful Same as the First

Calumet is made under such exacting conditions—packed in such a scientific manner, that its leavening strength and purity never vary. It retains its original strength for months after leaving the factories.

When you tip the can to get the last spoonful, you know your baking will turn out all right—the last spoonful is the same as the first. This uniform quality of

CALUMET BAKING POWDER

is cause for its big demand. Housewives know they can depend upon the results obtained—that climatic conditions or temperature cannot deteriorate its positive leavening power.

When you buy baking powder remember these facts—that a uniform leavener means bakings that do not vary in quality—that Calumet is uniform.

A pound can of Calumet contains full 16 oz. Some baking powders come in 12 ounce instead of 16 ounce cans. Be sure you get a lb. when you want it.

Leave the Car in the Garage

When you need a sack of feed or some groceries in a hurry—when you've got to make the railroad station before the afternoon train comes in—or when you want to borrow something at your neighbor's—a Harley-Davidson is the quickest and cheapest way to get there.

You can think of a hundred other errands for which a motorcycle and side car is "made to order." Save wear and tear on your automobile—add to its life—by using a Harley-Davidson for hurry-up business trips.

You can't beat a Harley-Davidson for economy. Fifty miles for a dollar—gasoline, oil and tires. It rides smooth and is easy to handle—even on bad roads. And you can use it every day of the year.

Harley-Davidson prices have been cut 25%. Ask your dealer, or write us for free illustrated literature.

store of food taken from a pack he had carried on his back, he made out a meal that put fresh vigor in his limbs, and made him think of his recent adventure almost as a dream. Could it be possible that a few minutes before he had been so near death that even now, but for this little cabin, he might be lying out, wrapped in the great white silence and done with the life flowing so sweetly through his veins? How narrow had been his escape? Was it even yet an escape?

From the past his thoughts flew to the present and the future. He had found a refuge, yet his food was all but gone, and where he was he had no idea. Rael knew that many a man before him had suffered a like and even a worse fate. Clinging too long to their interests in the mountains, they had been caught by the swift approach of winter. Some of them had perished miserably. Others had fared better, and had escaped unharmed. Rael could not be sure to which class he belonged. It was too soon to decide. For unless some searching party found him, he would have to spend the winter here, a pinched and starved winter, too.

There was another room to the cabin into which Rael had no more than glanced. Suddenly anxious to know the full extent of his resources, he crossed the threshold.

He found a room larger than the one he had just left, but it contained a wide fireplace, a board table, two or three chairs, some shelves that might once have contained books, and here and there a well selected magazine picture upon the wall.

Who could have built such a snug little place with its evident attempts at refinement the boy could not at the time imagine, though he found out afterwards that it belonged to an invalid who had come into the mountains for his health. If the room he had first entered could be called the kitchen, this might be called the living room. Over the kitchen there had been no other room, but in one corner of this room a flight of stairs led to an opening in the ceiling. Evidently the sleeping quarters were on the floor above.

He crossed the room and had just placed his foot on the lower step when from overhead came the sound of a heavy thump, as of some large, soft body striking the floor. So foreign was such a sound in that tightly sealed cabin that the boy's scalp began to creep, and something like a cold chill crept up his spine. He paused, every muscle tense and every sense alert for he knew not what.

(Continued next week)

HINTS FROM HOUSEKEEPERS

Italian Salami

I saw an inquiry for salami or Italian sausage in a recent issue, so am sending recipe which we use: 15 pounds ground pork, five pounds ground lean beef, onions and garlic to suit taste, ground, also salt and pepper to suit taste. Mix all together thoroughly and stuff in casings and hang in smoke till well dried. This will keep for a year in a dry place.—Mrs. C. M. Throop, Santa Rosa.

Boiled Sunshine Cake

One and one-half cups sugar, one-half cup water, one cup flour, one teaspoon cream of tartar, six eggs, pinch of salt, vanilla. Boil sugar and water till it threads, pour in fine stream over stiffly beaten whites of eggs. Beat until cold, add beaten yolks, then flour, salt and cream of tartar sifted together and flavoring. Bake in moderate oven 50 or 60 minutes. Let hang in pan upside down until cool.

Icing: White one egg, one tablespoon butter, vanilla. Add powdered sugar to white of egg without beating the white (as much sugar as the egg will take); cream about same amount with butter, then mix the two. Add flavoring and spread on cake. This cake is especially fine cooked in fireless cooker.—Mrs. B. J. Foster, Orange Cove.

HOUSEHOLD QUERIES

Scorched Lard

Can someone tell me if there is any way to sweeten or purify lard that has been burned in frying out, so that it may be used in cooking? I have about 50 pounds that is badly scorched. If

Why Don't YOU Share in these Big Savings?

Our FREE Catalog Saves Millions for Our Customers!

Isn't it vitally important—this season, more than ever before—to save every penny you can? Send TODAY—THIS VERY MINUTE—for Philipsborn's 312-page Style Book for Spring and Summer, with its 2,000 Challenge Bargains, and get your share of the big savings.

We have only printed 3,000,000 copies. This we fear is at least 2,000,000 short of the demand. Copies of the Style Book are supplied—FREE OF CHARGE—as long as they last. Requests are even now coming in at a rate unparalleled in our 32 years' history.

The only way to make SURE of your copy of the Style Book is to send the Coupon or a Postal today.

Styles Have Changed for Spring

Women everywhere are on the tiptoe of expectation because of the sweeping changes in styles which are revealed for the first time in PHILIPSBORN'S Spring and Summer Style Book. Every style sparkles with newness and beauty!

2,000 Challenge Bargains!!

You will be intensely interested in the 2,000 Challenge Bargains which PHILIPSBORN'S defy any other house in America to equal. Bargains in stylish, dependable wearing apparel for every member of the family. We guarantee our prices to be the lowest in the U. S. A. Everything shipped prepaid.

Charming NEYSA McMEIN

Famous Artist and Designer, Says: "Nothing I saw at the famous dressmakers of Paris excels with the wonderful display assembled in Philipsborn's Spring and Summer Style Book. It is truly a work of art."

Philipsborn's 32 Years of Leadership

Never in our 32 years' history have we offered such an immense variety of lovely styles—such an overwhelming number of real bargains as you will find in our Spring Catalog. Three million women save money by shopping with PHILIPSBORN'S Style Book.

Original Paris Models

Gowns, Suits and Coats costing as high as 5,000 francs in France—purchased direct from famous Paris dressmakers. Actual reproductions of the original models for as little as \$14.98.

The Oil Burner

You've Always Wanted

Study the Drawing and Note the Many Advantages of the "New Superior"

Double Burner, \$18---Single \$12
(Cook Stove) (Heater)

You know that a good Oil Burner in your cook-stove or heater would save you a lot of the money you now spend for fuel and, besides, prove quicker, cleaner and far more convenient.

First of all, you must be sure to buy the right Burner—one that is simple to install and operate—that is made of the highest grade material (not cheap cast iron)—that is correct in design—that will give a clean, clear flame, without roar, and is guaranteed not to fill with carbon.

You get all this and more when you purchase the

"New Superior" COAL OIL BURNER

An important feature of the "New Superior" is that it concentrates the heat in any part of the stove desired—over the oven, around the water coils, under the lids or wherever the hottest flame is needed. This is the Burner of the greatest efficiency, embodying the most advanced ideas in Oil Burner construction, at a reasonable price. And, remember, it is guaranteed for life not to fill with carbon.

The "New Superior" can be installed in any cook-stove or heater, without special tools. By following our simple instructions, anyone can set up the complete outfit in a half-hour.

**Order Today or Write
For FREE Literature**

You might as well begin now to enjoy the comfort and convenience of the "New Superior."

Send us your order today or ask for descriptive matter giving full particulars. We can refer you to satisfied owners in nearly every community.

Superior Oil Burner Co.
259B Market St. San Francisco, Cal.

there is no way to sweeten it what can it be used for aside from cooking?—Subscriber, Santa Rosa.

Ink Stains on Hardwood Floor

Please advise through your paper if there is anything to take ink stains out of a hardwood floor without scraping.—Subscriber, San Mateo.

If the hardwood is covered with wax or shellac finish, simply rubbing with cloth dampened in hot water will remove. Let spot stand wet for a short time if it is very dry and hard, when it can be readily wiped off. A little soap or Dutch Cleanser on cloth will not hurt finish if not too vigorously applied. Where finish is worn off and the ink has penetrated the grain of wood, cut lemon in half, rub ink stain with cut surface. If the stain is far into wood squeeze out lemon juice and let stand for several hours. If more than one application is necessary it will in no way hurt wood. It will bleach it lighter than surrounding wood, but a little dirt judiciously applied (rub with oiled dust cloth which has been used till slightly soiled) will make the cleaned spot uniform in color with uncleaned portion. A saturated solution of oxalic acid may be used in same way.

By the way, there is nothing so effective for cleaning drainboard of sink. After washing the supper dishes, rub cut surface of lemon over drainboard and let stand overnight. In the morning you will find it clean and white.

Again the Hand Knitting Machine

"I noticed in a recent issue of The Cultivator the request of a correspondent for some information regarding the auto-knitter. The same day I happened to run across the enclosed clipping from the Rural New Yorker and thought it might be of interest for your correspondent."

"My wife purchased an Auto-Knitter machine (Simplex) in October, and when it came I set it up for her and attempted to use it according to their instruction book. It was impossible to make a sock, and, after studying the machine, I started to put it in shape. Being a machinist, I was able to make the machine over, by changing various parts, filing here, boring a hole there, and putting some parts on that I made myself and, after going over every part and changing it, I made it so that it now does perfect work, although I had to discard the directions in the instruction book to do it, even after making the machine over. I have since made over 300 pairs of perfect socks, and a lot of women's and children's stockings, and have studied the machine from a practical, technical and theoretical standpoint, and here are my findings: The machine is defective in design, material and workmanship. The company took our work for a few weeks, and then began to reject work which was perfect, and which readily sold elsewhere. They made many mistakes, either intentionally or otherwise, in their dealings with us.—S. H. W., New York."

"I saw your article about the 'Auto-Knitter,' and I agree with what you said. I have run one four years and I don't know all about it yet. As to getting rich with it, you can't do it by sending the goods to the factory, but I can make about 30 cents an hour by selling them around home. I would not advise anybody to buy a house with one, or to expect to run one without practicing about six months. It usually takes about three weeks to get repairs and other supplies.—A. H., New Hampshire."

On these letters the Rural New Yorker comments:

"The above reports on the Auto-Knitter are more favorable than previous ones, but when a machinist has to make the machine over to get results it is easy to imagine the result had this machine fallen into the hands of some poor widow without mechanical skill or money to make necessary changes and repairs to secure production. And, of course, it is, as a rule, women in the poorest circumstances who seek to earn a little money in this way."—R. R. McLean, Farm Service Department, First National Bank of San Diego.

LABOR LOST

Small Boy.—What's the use of washing my hands before I go to school, mother? I'm not one of those who are always raising them.—Orange Owl.

ALMOND RECIPE BOOK

The California Almond Growers Exchange has ready for distribution a book of recipes telling how to use almonds in many forms in many different combinations. This book will be sent free on request to California Almond Growers Exchange, 311 California St., San Francisco.

Mention having seen this notice in the household department of the California Cultivator when you write.

Here is one of the recipes appearing in the book:

Almond and Date Cookies

1/4 cup butter, 1 cup sugar, 2 eggs, 3 tablespoons milk, 1 cup flour, 1 teaspoon baking powder, 1/4 teaspoon salt, 3/4 cup almonds, 3/4 cup dates, 1 teaspoon vanilla. Cream butter and sugar, add eggs well beaten, add milk and dry ingredients, mixed and salted, add chopped almonds blanching, chopped dates and flavoring. Drop in small cookies apart on greased pans; place a half almond on top of each and bake in a moderate oven until brown.

Red Top GUARANTEED Steel Fence Posts

RED TOPS save you money in three ways—in setting, in repairs, and in replacements.

It costs one cent to set a RED TOP against 10 to 20 cents for a wood post. No holes to dig; it drives like a stake. Holds staples always tight—does not burn, rot or break. Built for years of service.

If you want to know fence satisfaction try RED TOPS on your next new fence—or in repairing an old fence. Made in angles and tees.

Send for Circular giving all the facts

RED TOP STEEL POST CO.

431 Pacific Finance Building
Los Angeles, Cal.

Motor Troubles Ended

New Invention Creates Wonderful Spark—Doubles Power, Makes Winter Starting Easy, Stops Oil Pumping, Eliminates Carbon, Saves Gas—Free Trial Offer.

Any car owner who is bothered with a motor which pumps oil, fouls spark plugs, wastes gas or carbonizes badly, can stop these troubles by using a remarkable device called Warren Transformers, perfected by W. H. Warren, a Kansas City motor expert.

In two minutes a boy can attach Warren Transformers. Then you will be amazed to see your car go whizzing up hill on high where you formerly had to shift gears.

You will also notice a big increase in your mileage and instant starting in coldest weather. Spark plugs that formerly fouled and cylinders that pumped oil will be clean and dry and fire with full power.

If you want to save 25 to 50 per cent on fuel and repair bills, be rid of missing cylinders, dirty plugs and carbon, have a quick start in coldest weather and pep on hills, write the Warren Mfg. Co., 203 Gray Bldg., Kansas City, Mo., and a set of Warren Transformers will be sent immediately, with the understanding that they do not cost you a cent if not entirely satisfactory.

So confident is the Warren Mfg. Co. that Warren Transformers will more than delight you that they offer to send a \$4 set for only \$2. This is a special introductory offer, good only a few days, and readers should take advantage of it immediately.

Send No Money with your order—just your name and address, name of car and number of cylinders. Warren Transformers will be sent immediately. When they arrive merely pay the postman \$3 and postage. Use them 10 days. If not satisfactory return and your money will be refunded. Write today. End your motor troubles. This offer fully guaranteed.

Livestock News Notes

LIVESTOCK SALE CALENDAR

Holsteins

March 14, L. W. Bardsley, Tulare.
April 5, Guaranty Sale, Rhoades & Rhoades, Pavilion, Hynes.

Herefords

February 21, Pacific Coast Hereford Breeders' Association, University Farm, Davis.

Shorthorns

February 22, California Shorthorn Breeders' Association, University Farm, Davis.

Durocs

February 8, California Duroc-Jersey Breeders' Association, University Farm, Davis.

February 9, June Acres Stock Farm, Davis.

February 16, Sierra Vista Stock Ranch, Perris.

Poland Chinas

February 24, California Poland China Breeders' Association, University Farm, Davis.

Berkshires

February 27-28, American Berkshire Congress Show and Sale, Riverside.

Breeders in Washington have launched a campaign to abolish scrub and grade sires. The extension division is now conducting a survey and later a series of meetings is planned for each community. Bankers and business interests are expected to assist in financing the purchase of pure bred sires. California is in sore need of such a campaign.

T. B. Purvine of Petaluma has been making some very creditable register of merit records with his Jerseys. The aged cow Romulus' Legacy Jean has completed a record of 639.64 pounds fat from 9,613 pounds milk; Phyllis Fairy Belle is credited with 536.76 pounds fat and 9,925 pounds milk and Fairy Boy's Onan Ashantee in 330 days has produced 370.45 pounds fat and 7,379 pounds milk.

L. D. Smith of Humboldt County has been doing a brisk trade in Guernseys and has sold to Homer Fisher of Arcata the young bull Squire's Duke of Claremont and the three females, Bonnie Belle of Claremont, Mysie of Linda of Claremont and Mysie's Betty of Claremont. Silva Bros., Arcata, selected the two females, Claremont Lass and Polly of Claremont.

Howard Vaughn, manager of the forthcoming Shorthorn sale to be held at the university farm, Davis, during Stockmen's Week, writes that Caledonia Farms, West Sacramento, and Thos. T. Miller of Hollister have entered consignments. The former herd will be represented by offspring from their three well known herd bulls and the latter herd will send forward a number of sons of Imp. Secret Stamp and Greendale Sultan.

At the last annual meeting of the American Shorthorn Breeders' Association a reduction of the registration fee from \$2.50 to \$2 was ordered, effective January 15.

How to Stop
Calf Scours

You can do it in a quick simple reliable way—costs little. One good calf saved will repay the expense of protecting your whole herd for a long time against this infectious disease.

Leading breeders and dairymen throughout the country say, there is nothing like B-K. It contains no poison or acid—it is clear as water and safe to keep anywhere.

B-K acts as an anti acid and sweetner in stomach and also quickly kills the germs that cause scours or diarrhoea. It heals the inflamed membranes, relieves irritation and restores healthy action.

SAVE EVERY CALF

It's so simple to keep your barns sanitary and your animals in a healthy condition. B-K also prevents such germ diseases as Abortion, Retained Afterbirth, Barrenness, Calf Pneumonia, and you have this wonderful help all in one bottle—always ready.

Keep a supply of B-K handy for all the "little ills" of the barn—cuts, scratches, anything where infection can do harm.

GENERAL LABORATORIES

MADISON, WISCONSIN.

We will send you on request a bulletin telling you "How to Save Every Calf."

B-K is a pure sodium hypochlorite—every scientific man knows the value.

1 Gal. and 5 Gal. Pkgs.

Witherow & Stafford, Greenwood Farm, Live Oak, report the sale of a Duroc boar to C. F. Busjager of Manteca.

Entries to date indicate there will be about 25 head of sows and gilts consigned to the California Duroc-Jersey Breeders' Association sale at the university farm, Davis, February 8. Although the sale will not be large in point of numbers it will be a sale that will include a lot of sows of high quality. The consignors to date are: V. F. Dolcini, Davis; J. E. Thorp, Lockeford; Harvey M. Berglund, Dixon; Diamond Bar Ranch, Spadra; Golden Star Farm, Vacaville; H. P. Slocum & Son, Willows; W. M. Way & Son, Modesto; A. D. Long, Davis; M. W. Cutler, Redding; R. E. Clifford, Davis; University of California, Davis; Lowell J. Beaver, Fresno, and Witherow & Stafford, Live Oak.

Thomas Harrison of Santa Rosa has sold the aged Percheron stallion Motif to the San Luis Obispo Polytechnic School. Motif was sired by Tamerlane, and his dam was Jonquille. He was grand champion at the recent California National Livestock Show.

L. D. May, generally regarded as the dean of Milking Shorthorn breeders, died at his home near Granville Center, Pennsylvania, early last month.

A plan is being projected by a number of San Francisco sportsmen to revive racing at the old Tanforan race track south of San Francisco. Years ago this track was the scene of many high class meets and with the renewed interest in racing it is hoped to regain some of its past glory.

The directors of the Western Berkshire Congress at a meeting held at Sacramento last week decided to abandon the annual sale held at the university farm and to lend united support to the show and sale to be held at Riverside February 27-28.

Alex Wilson, manager of the swine department of the Italian Vineyard Company, Guasti, has secured the services of Wilson Rowe as herdsman for their Berkshire herd. Rowe is one of the best known men in Berkshire circles. For many years he was herdsman at the Iowa state college. Later he was in charge of the Iowa herd. In 1920 Rowe judged Berkshires at the California state fair.

V. F. Dolcini, June Acres Stock Farm, Davis, has arranged to hold his sale of Duroc-Jersey sows and gilts at the university farm, February 9, the day following the association sale. This will be Dolcini's first public sale, although his herd is one of the oldest in the state. He is featuring the get of his popular sire, Choice Wonder 3d, grand champion at the 1920 state fair. As attractions he has included the champion sow of 1918 and half sister of the 1921 champion sow.

DAIRY MANUFACTURING SHORT COURSES

The ten day courses for experienced men connected with commercial dairy manufacturing plants will open at the university farm next Monday. The following courses are offered: Butter makers and creamery managers; cheese makers, milk plant operators. These courses will all be given at the same time by the dairy industry division of the college of agriculture assisted by the United States dairy division and state department of agriculture. Several men connected with commercial dairy manufacturing have been secured to take part in the discussions of the subjects to be presented. Those interested in taking these courses should register at the administration building Monday morning, February 6. Instruction starts at 1:30 p.m. on that date. The courses will close with the annual meeting of the California Butter, Cheese and Ice Cream Makers' Association.

FIRST DUROC SALE A SUCCESS

The first Duroc sale of the season was held by Witherow & Stafford at their Greenwood farm near Live Oak, January 26, and furnished ample evidence that California farmers are developing substantial interest in pork production. Twenty-eight head of bred sows and gilts were eagerly snapped up at a general average of \$53.30, a valuation entirely satisfactory to the

sellers. The offering was a balanced lot of well bred and nicely developed breeding material. The top, \$77.50, was paid by J. F. Moorehead of Chico for a two year old daughter of John-son's Defender Jr. Moorehead was the heaviest buyer at the sale, taking 11 head. Other buyers were: H. P. Slocum & Son, Willows; G. W. Summy, Meridian; J. H. Ballou, West Butte; Floyd Onyett, Oroville; C. B. Phillips, Dixon; W. W. Hooper, Gridley; C. W. Scott, Winters; Ralph Albee, Weed, and J. L. Ames, Live Oak. Ord L. Leachman of Sacramento was the auctioneer.

Tells how
to pick
out
Good
Cows

This 84-page book is worth its weight in gold. Its author, Hugh G. Van Pelt, a prominent dairy editor and former professor of dairying, is a practical dairyman and one of the best judges of dairy cattle in the country. It is so plain and simple that any one can use it as a guide in selecting good cows, and building up a herd for large and profitable production.

We will gladly send you this book free of charge if you will fill out the blank below and send us the names of

five people who will need cream separators or milking machines within a year's time.

Any one who is wasting cream by using an old, worn-out or "balky" separator, or by hand skimming, needs a De Laval Separator. Any one who is milking ten or more cows by hand needs a De Laval Milker.

If you cannot give five names, we will send you this book on receipt of 20 cents.

DAIRY DAY

The dairy cow will be the guest of honor at Riverside on Saturday, April 8, at a big dairy day celebration. Plans for this event were formulated by a committee of the Associated Chambers of Commerce of Riverside County, consisting of J. E. Wherrell of Riverside, chairman; Robt. N. Clapp, Nuevo; A. J. Stalder, Riverside; Geo. W. Thomas, Arlington, and S. F. Kennedy, Riverside.

All the prominent civic organizations of the county have appointed representatives to take part in this demonstration and at a general meeting held in Riverside committees were appointed to look after every phase of the work.

The important place held by the dairy cow in human life and development as well as her financial importance will be demonstrated in an elaborate series of floats and window displays.

The importance of the dairy industry is rapidly becoming a leading feature in Riverside County development. The animal industry division of the state department of agriculture is expected to take an active part in developing visual instruction and the committee also expects a very instructive and interesting display from the federal government. Various state organizations connected with many forms and various phases of the dairy industry have also signified their intention of taking part. This exhibition will be held in Riverside, with a parade, plays and exhibitions in the various store windows and a milk fairy pageant.

A competitive contest in poster and essay production will be held in both the elementary and the high schools of the county, with cash prizes for each class of work from each class of school.

DIVERSIFY

There seems to have been a new expression adopted in reference to our recent cold spell. We don't say "freeze" now; we say "low temperature." That sounds better and let us hope that the final findings may be much more agreeable than some of us are inclined to predict.

Among many hog breeders the question seems to be, "What effect will this citrus setback have on the coming hog sales?" It doubtless will be felt by the hogmen, but in only one way—it will do them good. The orange situation somewhat resembles the cotton situation. We all know that during the cotton boom thousands of acres were planted to cotton which should have been devoted to livestock and general agriculture. Every section of Southern California is not adapted to oranges and a great many men now engaged in citrus growing would be more profitably occupied if they were growing livestock, and even others might well consider the advantage of a small dairy and hogs in connection with the orchard. Inasmuch as the hog industry has stood the gaff of reactive commercial changes about as well or better than any other industry it is quite possible that a good many fellows who discarded the good old livestock for an inviting orange grove will now be inclined to gather up a few "mortgage lifters."—G. A. S.

BERKSHIRE CONGRESS

The coming annual sale and show of the American Berkshire Congress at Riverside, February 27-28, should encourage more activity in the swine growing industry. This event is of national importance and the Berkshire boys all agree that the purpose of the convention is not to create high prices or to put any breeder into the limelight, but to stimulate interest in the industry and to let the people know that agriculturally California is very much on the map. The show will be conducted along the same lines as the best fall fairs. Premiums and prizes are offered for all classes and special premiums are offered for barrows. There will be a judging contest for boys, open to any club boy, and also a men's judging contest. An invitation is extended to growers and breeders of all breeds of hogs to attend the show, to criticize or commend as they see fit. The directors of the Southwestern Berkshire Congress feel that a mixing of all breeders can only result in a general benefit to all,

inasmuch as we have the same object in view, viz., the development of a better hog and the advancement of the livestock industry.

FEEDING RICE AND BY-PRODUCTS TO SWINE

California is one of the largest rice producing states, and much interest has been manifested lately in the feeding of rice and rice by-products to swine. Experimental evidence on this subject is meager. In view of these facts we are realizing the need of more information concerning these feeds. An experiment was outlined and started at the university farm in October, 1921. The plan called for 16 lots of ten hogs each to be fed various rations. The equipment at the university farm made it inadvisable to feed more than eight lots. Eighty head of hogs were divided into eight lots of ten hogs in each lot. They were fed the following rations in dry lot. All the lots were self fed: Rolled barley and tankage; rough rice and tankage; rice polish and tankage; rice bran and tankage; rice polish, rice bran and tankage; rolled barley, rough rice and tankage; rolled barley, rice polish and tankage; rolled barley, rice bran and tankage.

These lots of hogs were finished December 10 and slaughtered by lots. A record of their dressing percentages and other data were obtained from the packing plant.

There are 80 more pigs in the feed lot at the university farm at this time. They are receiving the same rations and are fed in the same lots as the ones that were used on the first test. These pigs will be ready for market during Stockmen's Week or shortly after. The results of these two tests will be given out on Thursday, February 23. It will be possible for visitors to see the various lots of hogs at that time.—E. H. Hughes, in charge of Swine Section, University Farm.

SWINE BREEDERS TO MEET AT U. C. FARM

The annual business meeting to the California Swine Breeders' Association will be held at 9:30 a.m., February 23, at the university farm. At this time J. I. Thompson, president of the association, will give talk on "A Development Program for the Association."

The California Swine Breeders' Association is responsible for the pure feed law now in operation in California. This association has been responsible for the classification of swine at the state fair and indirectly has been responsible for the classification at other California shows. The first auction sale of pure bred hogs held in California was under the auspices of this association. There are many things to be done to put the swine business of California where it belongs. Mr. Thompson will outline projects which the association might develop during the coming year.

A ham and bacon show will be held in connection with the meetings and it is hoped that this show will cause increased interest in swine production and in developing a revival of interest in home curing of good hams, bacons and sausage.

HAM AND BACON SHOW TO BE STAGED

A ham and bacon show will be held in connection with the annual Stockmen's Week at the university farm February 20-24. It is hoped that such a show will cause a revival of interest in home killing and curing of pork products and especially the making of good hams, bacons and sausage. This show is to be held under the auspices of the California Swine Breeder's Association. Liberal premiums will be offered. Premiums are offered for: Best home cured country ham. Best home cured country bacon. Best home cured country shoulder. Best smoked or other cured country sausage to be shown in jars, sacks or cases. Best fresh country sausage. Best exhibit of meat in the above classes from any one exhibitor.

For details write to E. H. Hughes, Secretary of the California Swine Breeders' Association, Davis, California.

SAN BENITO-SANTA CLARA COW TESTING

The San Benito-Santa Clara Cow Testing Association now has 32 members. The total number of cows represented is about 1,200. The project was started by the San Benito County farm bureau in 1921, with Frank Frazell, prominent dairyman, as chairman of the committee in charge. J. R. Screaton is official tester, and has been carrying on tests since October, 1921. Mr. Screaton is thoroughly familiar with cow testing association work, having had experience in New Zealand along this line.

Early in January a drive was put on which netted some 400 cows to the association. Prof. V. C. Bryant of the University of California spent two days aiding in the work, together with County Farm Advisor W. J. Tocher. Members of the cow testing committee are S. D. Pedrazzi, L. Ladd, E. Holbrook, Dr. C. S. Brooks and E. A. Weller.

After four months of testing some dairymen are weeding out a good percentage of their poor cows. While ordinarily a year's record is used as a basis of culling, some cows show up so poor that they are marked as "boarders" early in the game and are sent to the butcher.

INTEREST IN BETTER SIRES

With exactly 5,900 persons enrolled in the "Better Sires—Better Stock" campaign at the close of the calendar year 1921, records of the United States department of agriculture show a continued interest in this work which has extended to all states and several island possessions. During the year the number of livestock owned by the persons enrolled increased from about 400,000 to 750,000. The figures include both male and female stock. All of the males are pure bred, and the females, which may be of varied breedings, are bred in all cases to pure bred sires.

It is noteworthy that 56 per cent of all female stock listed are pure bred. This figure is one per cent higher than a year ago. The effect of the use of pure bred sires in reducing the number of scrub animals on farms is shown by the small proportion of scrubs in herds and flocks headed by pure bred males. The figure at the end of the calendar year 1920 was 2.1 per cent and for 1921, 1.9 per cent scrubs in such herds.

VALUE OF COW TESTING SHOWN BY COMPARISONS

With figures from a Virginia cow testing association as the basis for his calculations, a representative of the United States department of agriculture has made some convincing comparisons of the best herd and the poorest herd, that bring out with unusual emphasis the value of testing.

There were 511 cows owned by members of the association. The best herd consisted of 16 cows, with an average of 306 pounds of butter fat in a year. The poorest herd had 91 cows, averaging 155 pounds butter fat in a year. The first herd made an average income of \$75 per cow over the cost of feed consumed; the latter made an average return over feed cost of only 64 cents per cow.

The introduction of a few variations on these figures will help to show just how far apart were these cows in the two herds. The average cow in the best herd produced more income above the cost of feed than all of the 91 cows in the other herd. It would require 117 cows like the average in the poor herd to equal in profit production one of the cows in the top herd. To equal the herd of 16 good cows a farmer would have to keep 1,872 animals like the average cow in this poor herd.

LIVESTOCK BROKERAGE AND SALES

Believing that a need has existed here for some time for an efficient livestock exchange and vending concern, C. R. Thomas announces that he has opened an office at San Francisco. For more than 30 years Mr. Thomas has been closely allied with the livestock industry; as secretary of one of the major national breed associations; as manager of its sales and of those of its members; as commissioner in private treaties, and as manager of livestock shows, including the late California National.

At Milking Time
That's when it Proves its Worth

DOESN'T it stand to reason that if a cow's milk-producing organs are out of order there is certain to be a reduced milk flow? Stands to reason, too, that there will be enough loss in just a few milkings to more than offset the time and slight expense of giving prompt medicinal assistance to a cow that is in any way "off-color."

This is where Kow-Kare comes in. In a great majority of the best dairies this cow medicine is used regularly, at intervals during the housed-in winter season. When the cow's producing organs are put to severe strain by the loss of pasturage and the use of heavy concentrated foods and roughage, Kow-Kare will avoid a break-down by keeping the digestive and genital organs in a healthy, normal condition. Regularly at milking time you get big premiums on every penny invested in Kow-Kare.

More Profit in the Milk Can

COWS must be kept healthy if they are to show a profit. Most of the diseases common to cows can be successfully and easily treated at home by using Kow-Kare according to directions. Barrenness, Abortion, Retained Afterbirth, Scouring, Bunches, Milk Fever, Loss of Appetite, etc., are promptly cleared up by Kow-Kare because it acts directly on the organs where these diseases originate. The use of Kow-Kare for two weeks before and after calving works wonders in carrying the cow over a time when her powers of disease-resistance are greatly lowered.

A package of Kow-Kare, plus our valuable free book, "The Home Cow Doctor," will put more profit in the milk can and set your mind at ease. It's the cheapest form of health insurance.

General stores, feed dealers and druggists sell Kow-Kare at the new reduced prices of 65c and \$1.25.

CATTLE

GUERNSEY HERD FOR SALE

My foundation herd of pure bred Guernseys, representing the most popular blood lines of the breed, is for sale. It includes such animals as Rebecca of Sunnyview, the state champion cow in BB Class, and Veda of Chiconia, whose son sold for \$10,000. Both cows are in calf to a son of the great Itchen Daisys May King of Langwater, who has a number of high record daughters. The herd consists of 14 mature females fresh or safe in calf; 3 heifers and 5 young bulls sired by Masterpiece of Edgemore, Pencoyds Golden May Secret and Itchen Daisys May King of Langwater. They combine show type with high production.

All animals tuberculin tested and guaranteed breeders. Will be sold singly or a specially attractive price will be made on groups.

Dr. J. A. Woodside, Rita and Fulton Aves., Van Nuys, Cal. Guernseys—Grape Wild Farms—Berkshires—Young bulls, from calf age up to 16 months old, of May Rose breeding and out of A. R. cows. Bred sows and gilts, service boars and pigs of both sexes for sale. Grape Wild Farms, Escalon, California. A. B. Humphrey, Proprietor.

Ridgewood Ranch—Registered Herefords. Chose bred, big rugged registered bulls of serviceable age for sale in carload lots or singly at attractive prices. Correspondence solicited. Visitors welcome. C. S. Howard, prop.; Otis Cordell, herdsman, Willits, Mendocino County, California.

Berylwood Stock Farm—Breeders of registered Holstein cattle and Duroc-Jersey swine. Every cow an A. R. O. and T. B. tested. Bulls and females for sale. J. W. Snodgrass, Hueneme, California.

Shorthorns bred for range purposes and of Pure Scotch Blood Lines. Show herd won highest honors in 1917. Visitors welcome; information cheerfully given. T. T. Miller, Hollister, California.

Big Type Durocs—Better Durocs at right prices. Harvey M. Berglund, Dixon, California.

Veterinary

Answers in this column by Dr. Wm. Petrie, 2714 South Harvard Blvd., Los Angeles, are without charge. For immediate mail answer remit \$1.00. In writing questions give full symptoms or particulars of injury of animal.

Udder Trouble

One of my cows has a hard lump in her udder about the size of a base-

ball. It has been there about two weeks. She has been fresh six months. Prior to the lump coming she was bothered with gargetty milk. Can you suggest some remedy?—Subscriber, Hynes.

The lump in the udder is caused by the gargetty milk, as you call it, clogging the ducts, and it may form an abscess. You should have started the treatment when the thick, lumpy milk first appeared. Lumpy milk is the first symptom of congestion of the udder and should not be neglected one moment. Congestion of the udder may be caused by a bruise or extreme cold weather but is usually caused by the condition of the blood. Some cows that get dry feed continually get constipated and the blood gets thick. The thick blood clogs the ducts in the udder and trouble begins. Laxative feed should be given, and be sure that she gets plenty of good water to drink. Roots, green feed and sloppy mashers are also good. To thin the blood quickly give a physic of salts. One pound of epsom salts and half a pound of common salt dissolved in two quarts of hot water is the right amount. When cool give at one dose as a drench. Or a handful of salts, mixed as above, given in the feed twice a day for a week will do the same but not as soon. Your cow will probably lose that quarter but maybe you can save it by using the above treatment and carefully rubbing the quarter and milking it out clean every time.

More Udder Trouble

Cow seems to have much trouble with her udder caking every time she comes fresh. The time before the last after milking for some time she lost the use of one quarter. The last time she nearly lost the use of two quarters and dried up sooner than she should have. She has been dry now about four months and is due to calve again soon. Could I prevent the caking by treatment before calving? I read your article on "Udder Trouble" in the Cultivator of January 7, but this cow will not eat any medicine in the feed. She will refuse feed with only common salt in it. It seems to me that any of the cows here do not eat as much salt as those I have known in Wisconsin. What would you advise doing?—Subscriber, San Diego.

When a cow refuses medicine in the feed put it in a long neck bottle, add water, shake and give it at one dose as a drench. A cow is very easy to drench. With your finger and thumb in her nostrils like a leading clasp, pull her nose up and pour the medicine into the mouth, a little at a time, giving her time to swallow. It would be good to start milking her some time before she comes fresh. Also feed her green feed, roots and sloppy feed. Don't forget the salts.

Drying Up Cow

Kindly give me some information about drying cow. Last year I milked her right along until fresh but was told this was not good for the cow. I started to dry her about five weeks ago by milking her once a day, then every other day until she gave very little and that was very thin, when I stopped. She will be fresh again soon. I tried her teats this morning and got a yellow substance, part water. Is this a bad sign?—Subscriber, Arroyo Grande.

Cows that are milked every day of the year very seldom have udder trouble or milk fever at time of calving. It is a great shock to a cow to be dry and then start a large flow of milk at once. The shock of calving is enough at one time. The cow that gives a regular flow of milk the year around will give more milk in the year than the one that has a great flow on coming fresh and goes dry part of the year. The milk may not be very good for a week or two before coming fresh but you can give it to the chickens. If the cow is fed green feed and her bowels are free she will probably come fresh all right, but if she has been getting dry feed it would do her good to put a handful of salts in her feed once a day for a week or two before calving. Mix two parts epsom salts with one part common salt. Do not bother the udder until she comes fresh unless it fills up too full, then milk it out and relieve the pressure. Read the other questions and answers in this column.

Why Should I Cooperate?

IN DISCUSSING the problems of the cooperating poultrymen of California in marketing their products, Cornele G. Ross, chairman of the executive committee of the Poultry Producers of Southern California, writes:

The above query, or one of similar import, is usually the greeting which meets our field representative when he solicits poultrymen to join our organization and become a part of the movement to upbuild and strengthen the industry. The great majority of poultrymen, while willing to admit that cooperation has done and is doing much for the industry, are inclined to forget the conditions which confronted us six or seven years ago, and which led to the forming of the California cooperative poultry associations as the only means of saving the industry.

Doubtless many of them are new to the business and have no personal knowledge of the conditions which existed in our industry in 1913 and earlier, but the older poultrymen should refresh their memories as to what we were up against in those days, and rally to the support of the only means of preventing a still more serious situation during the coming season.

In 1913 California did not produce enough eggs for its own consumption and yet, in spite of the necessity of importing eggs from the Middle West our local markets were dominated at the whim of the jobbers, and prices were governed solely on a market fixed absolutely by the purchaser. These jobbers made their profit at so much per dozen and the lower the market the greater the consumption and consequently the larger the profits.

In the flush of the laying season this frequently meant a market price below the poultrymen's cost of production, and as the producers were unorganized they were forced to place their eggs upon the market at whatever figure the jobbers would pay, while the jobbers placed them in storage to be sold later at "all the traffic would bear."

The following table, showing the "low" and "high" market for each month of 1913 shows what happened without cooperation on the part of the producers, but in a market which had to bring in eggs from outside the state to supply the demand.

Los Angeles Produce Exchange quotations on case count, highest and lowest: January, .35, .22; February, .29, .18; March, .23, .18; April, .21½, .23; May, .24, .21; June, .26½, .23; July, .30, .23; August, .34, .30; September, .40, .34; October, .45, .40; November, .54, .45; December, .52, .43.

Can any of you imagine where these figures would have gone with a surplus production of close to 1,500 cars, or say 700,000 cases of eggs, as there has been this year, and with Oregon and Washington at our doors with their growing surplus to dispose of?

Our last census returns show an increase in poultry in California, from 1910 to 1920 of 55 per cent; the present year will show a larger proportional increase for 1921, and from all available data, 1922 is coming strong, both in California and in our neighboring states, and the question is, how can we dispose of this immense surplus without greater and more loyal efforts on the part of all the producers to join in cooperative marketing?

Even the most superficial study of the situation should convince those interested that cooperation alone is responsible for our standardized grading and pack, and the distribution of our surplus to foreign markets opened to us by virtue of the high quality of our product.

All this has been accomplished in the face of criticism and obstruction on the part of short sighted producers who are unwilling to realize that we have an industry here in California which could be expanded to unlimited proportions if we would work together. Many producers are withholding their support of this movement on the ground that they cannot afford to deprive themselves of the higher price which they can obtain

for their product by selling on the outside.

Granting that, as long as the cooperative organizations are strong enough to stabilize the market, by exporting or storing the surplus, a producer can, in some cases at least, obtain more for his eggs than the organization can pay, are you willing to continue the selfish policy of placing your eggs in the hands of those whose sole interest is to increase their net profits, by any means available, and always at your expense?

Every producer of poultry products should realize that the jobber is only interested in his profit per dozen, and that he consequently desires to buy at the lowest figure possible, and will use every means in his power to depress the market quotation; that he only buys to supply his own retail trade, and has no particular interest in exporting any surplus (without cooperative organizations the only one who would be interested in export shipments would be the speculator, who would wish to purchase at the lowest figure and would expect to pocket the profits); that it is to the jobbers' interest to cripple or disrupt all producers organizations, and his offers of premiums above the market are directed to this end.

We hope our members will give these facts due consideration; that they will investigate for themselves and see if they do not find that our industry is facing an enormous surplus production during the coming season, not only in our own state but elsewhere; that they will realize if this surplus is not, to a considerable extent at least, in the hands of responsible producers organizations, it means a market subject to wide fluctuations and much lower levels than would be the case with a standardized product in the hands of our own organization.

Our organizations are growing in knowledge of the best marketing methods; we are perfecting methods of helping our members, other than marketing his eggs; we have created a reputation for a standardized product of high value, and it would seem the better policy to stick to our guns and continue to advance, even if some of the short sighted and selfish outsiders do get a bit more for their eggs, than it would be to permit our organization to be weakened or disrupted and see the industry wrecked from inability of any of us to get cost for our product in a market glutted by thousands of producers seeking to dispose of their eggs at some figure, regardless of cost.

Poultry Queries

Conducted by Jean A. Koethen

Chicken Pox

In reading the Cultivator I have noticed a great many inquiries about chicken pox in the last two months, also the advice and treatment the paper has published which is very good for I have tried it.

I have found that chicken pox can be avoided if one will watch the weather and the feeding. When feeding for egg production in cold weather one is rarely troubled with chicken pox. So I have tried this formula with very good results: I put one tablespoon of salts to each quart of drinking water once a week if weather is warm and follow it up with the same amount of sulphur to each quart of mash.

This formula will also cure the chicken pox. If one has the time to get rid of the sores paint the combs with creolin. One application is all that is necessary, but care must be taken not to get it directly in their eyes. If poultry men will use this treatment they will not be bothered with chicken pox. Don't give salts in cold weather.—R. J. Harrison, Flagstaff, Arizona.

Age of Hatching Eggs

I would like to know how long I can keep eggs for setting.—Subscriber, Lancaster.

If You Are Going to Brood

anywhere from 200 to 1500 BABY CHICKS and would like to have a SYSTEM that will furnish all the WARM FRESH AIR required, no matter what the climatic conditions may be, write us for our

Hatching Capacity 200,000 Eggs
White Leghorn Chicks Only

Our customers contest which closed September 30, 1921, showed Farm No. 11 with 600 pullets hatched February, 1920, laid 217.09 eggs each, all in one flock. Can you beat this record?

We supply you stock bred for over 10 years for heavy production, incubated in the finest hatchery with perfect ventilation. Chicks delivered in perfect condition by our two specially constructed and ventilated auto delivery cars; capacity, 15,000 chicks at one load; or packed for express shipment by an expert who had 15 years in the Express service. Can any other Hatchery or Breeder offer you such service and quality chicks?

Call and see our new AIR WASHER SYSTEM, nothing like it anywhere. Perfect ventilation. We are exclusive hatchers for spring of 1922, for F. R. Richardson, George J. Richardson, Charles G. Weaver, L. G. Hack, G. A. Saylor, C. W. Phelps, and George L. Miller; being the product of 25,000 selected breeding hens.

Our special Egg Turning Trays are now available for other hatcheries in quantity. Send for circulars.

HERCULES MFG. CO.
CENTERVILLE, IOWA

When Writing Advertisers Please Mention Cultivator.

Eggs for hatching should not be kept more than ten days before incubation is commenced. After the tenth day the germ weakens rapidly. The sooner incubation is begun after the eggs are laid the better hatch you are likely to have.

Duck Raising

I am going into the duck business and would like to know what kinds of ducks are best. Where can I get them and what is best to feed them?—R. F., Watsonville.

The best kind of duck is the one that suits your purpose best. If you want eggs—market eggs, I mean—get Indian Runners. I believe the Muscovy is considered a very good market duck, but the White Pekin is generally preferred by people who want to make a business of raising ducks for market. The Pekin grows rapidly, reaching a marketable size at about ten weeks of age, and is grown by practically all the big duck farms. If you will study the advertising columns of the Cultivator you will find the names of several breeders who will be glad to sell you eggs. Ducklings are fed a soft ration from the first. Bread crumbs or bread crumbs and bran scattered over a clean board are good for the first meal. After that, when the birds have learned to eat, mix a mash of $\frac{2}{3}$ bran and $\frac{1}{3}$ cut alfalfa, add about 1-5 sand or chick grit, moisten with water till it is crumbly and give on a board three or four times a day. After a week you can begin to add a little corn meal, and by the end of the second week your mixture will be $\frac{1}{3}$ bran, $\frac{1}{3}$ corn meal, and $\frac{1}{3}$ alfalfa or other greens. Never forget to add the sand for the ducklings cannot digest their food without it. After the third week you can add a little beef scrap and increase till it is about 1-5 of the whole.

Colony House Details

I should like a little more information concerning the type of poultry house shown in the Cultivator of November 26, used on the Major Ranch at San Gabriel. How are the roosts and nests arranged on the inside? Is the south side all left open while chicks are brooded? What is used for the support of roofing paper? I cannot figure how it can be built for \$15 when one by three lumber is \$51 per thousand and tar paper costs \$2.50 and \$3 per roll.—Subscriber, Moreno.

I took these questions to Mr. Major who replied that the \$15 the house cost him did not include labor, for he did the work himself. The lumber cost him \$35 per thousand and the tar paper \$2 per roll. The roosts are not over 18 inches from the ground and extend clear across the rear of the house, while the nests are along the front. Roofing paper is supported by wire. The south side was left open when chicks were brooded except for a curtain that could be rolled down when necessary. Mr. Major will not brood by this method again, however, because the labor involved is considerably greater than when the chicks are brooded in large flocks around a brooder stove.

Roupy Hens

One of our hens has been ailing for six weeks. Her throat is filled with a yellow substance; she swallows with great difficulty and sometimes gasps for breath. Is this trouble contagious, and how can it be cured? Our roosting house is open to the sun and air all day and closed at night and is cleaned daily.—Subscriber, Del Mar.

There is not much use trying to cure a hen that has had roup so long. Better kill and bury deep. You might swab out her throat with a 2½ per cent solution of creolin and glycerine, or with silver nitrate or peroxide of hydrogen, but your flock will be better off with her out of it. Should another case appear remove the bird from flock at once and swab out her throat, but if she does not improve immediately put her out of the way. Roup is contagious to a certain extent, but isolated cases sometimes occur in healthy flocks. If the roosting house is closed at night that probably accounts for this case and may cause others. Sunshine and daily cleaning are good as far as they go but as long as you force your flock to breathe and re-breathe the same air all night you will have roup.

McQUAY-NORRIS PISTON RINGS

For Every Purpose and Price

It pays to replace worn and leaky piston rings with McQuay-Norris Piston Rings. They will increase power, save gas and oil, and decrease oil and carbon troubles in any make or model of passenger car, truck, tractor or stationary engine. The McQuay-Norris line is complete for every need. Through the addition of McQuay-Norris WAINWRIGHT Pistons and Piston Pins to the Mc-

McQUAY-NORRIS
WAINWRIGHT
PISTONS & PINS

Quay-Norris Piston Ring line, you can now secure for your gas engines complete McQuay-Norris-made Piston, Piston Pin and Piston Ring equipment.

Send for Free Booklet — a valuable explanation of the relationship of piston rings to gas engine operation. Address Dept. AB

McQuay-Norris Manufacturing Company
St. Louis, U. S. A.

\$1.25 LEAK-PROOF — for greatest power. In Canada \$1.50 Prevents loss of gas by means of its exclusive two-piece design, which creates even outward expansion all around the ring, thus maintaining equal pressure against the cylinder wall. Always install with one Supercyl Ring in the top groove.

\$1.00 Supercyl — to control oil. Its special reservoir collects excess oil from the cylinder wall on each down stroke, emptying on each up stroke, which ordinary grooved rings cannot do. Install one in top groove, regardless of which compression rings are used in lower grooves.

50c JIFFY-GRIP — a lower-priced, one-piece ring that has proved its efficiency within the limits of one-piece design. Has an improved non-butt joint — and velvet finish that "seats in a jiffy." Always install in combination with one Supercyl Ring in top groove of each piston.

Snap Rings — of the highest grade. Raised above the ordinary level of "bulk" rings by the care and uniform accuracy of McQuay-Norris manufacturing methods. Packed twelve rings to the carton — and rolled in waxed paper which preserves them from rust and breakage.

Made of Electric Iron

FOREMOST Because of Merit

BUCKEYE "Colony" Brooders are foremost because of merit. They have revolutionized chick raising. Literally they make three chicks grow where one grew before; reduce the labor to a fourth and cut the expenses to half. These brooders have entirely removed the great mortality that made brooding so hazardous. Burn coal, oil or gas.

Endorsed Everywhere

Hundreds of thousands of poultry raisers depend on Buckeye "Colony" Brooders as a result of experience. Experiment stations endorse them unreservedly. Your way to success is with these wonderful brooders. Sold under a positive money-back guarantee by 15,000 dealers.

The reasons for this unquestioned superiority are set out in our new booklet, "The Revolution in Chick Raising," a copy of which should be in the hands of every chicken raiser. Write for it today and place your chick raising on the securest of foundations.

Garlic: 8@10 lb.; poorer, 5.

VEGETABLES

These are the actual prices obtained between 7 and 8 o'clock, January 31, by wholesalers in their sales to retailers, peddlers, hotels, restaurants, cafeterias, etc. Terms: Cash on the walk.

The supply of vegetables on the local produce market has been limited by the recent freeze and several commodities were scarce and higher in price yesterday. Cauliflower averaged 50 cents a crate higher than Monday and sold from 2.75 to 3 a field crate. Celery was also high, the best local stock selling from 6.25 to 6.50 per crate. Cabbage prices were unchanged and much poor stock was offered. Lettuce was firm, but a good deal of the offerings were only of poor quality.

Artichokes: Doz., 1.75@2.00. Brussels sprouts: 17@18 lb. Sacked vegetables: Beets, 2.75; carrots, 2.50@2.75; turnips, mostly 1.25@1.50; parsnips, 2.00@2.25.

Bunched vegetables: Per doz. bunches: Turnips, 50@60; carrots, 75@1.00; beets, 80@1.00; radishes, 25; parsley, 20; spinach, wide range in quality, 45@50.

Cabbage: Market stronger. Per field crate, mostly 2.50@3.00.

Cauliflower: Market stronger. Wide range in quality. Per field crate, mostly 2.75@3.00; few best, 3.25@3.50.

Celery: Market stronger. Locals: Best, 6.25@6.50; poorer, 5.00@5.50.

Cucumbers: Market steady. Hothouse, mostly 1.00@2.50. Celery: Market firm. Locals: Best, 6.25@6.50; poorer, 5.00@5.50. Chicory: 90@1.00 crate. Lettuce: Demand moderate, market strong. Locals: Too few sales to quote. Imperial Valley: Best, 1.00 per dozen heads; 2.75@3.00 field run shipping crates; 3.75 packed crates. Parsnips: 75@1.00. Onions: Green, 15 bunch. Peppers: Mexican chili, 16@20; Bell, fancy, 40. Rhubarb: Box, 2.25. Tomatoes: Market steady. Mex., lug, repacked, 4.00@4.50; original crate or lug, 3.75; crate, 3.75.

FRESH FRUITS

Apples: Demand and movement moderate, market steady. Locals: Winesaps and Romes, mostly 4@5; few 6; Delicious, 5@7; few 8; B grade Delicious, 2.25@2.75; fancy, 2.75@3.25; few 3.50; Winesaps, fcy., 2.50@3.00; B grade, 2.25@2.50; Romes, fcy., 2.50@2.75; B grade, 1.75@2.00. Watsonville: Fancy, 3½ and 4 tier Bellefleurs, 1.60@1.65; few best, 1.70@1.75; poorer, 1.40@1.50; 4½ tier, 1.30@1.35; loose, per lb., 3@4; Pearmain, 4 tier fcy., 2.00@2.25; Yellow Newtown Pippins, 4 tier fcy., 2.00 @2.25. Northwestern: Spitzenburgs, medium to large, extra fcy., 3.00@3.25; fcy., 2.75@3.00; Winesaps, extra fcy., medium sizes, 3.00@3.25; fcy., 2.75@3.00; Romes, extra fcy., 2.75@3.25; Yellow Newtowns, extra fcy., 2.75; fcy., 2.50. Avocados: Lb., 50@75.

CITRUS FRUITS

Grapefruit: Movement moderate, market steady. Californians: Northern: Packed box, 3.00@3.25; market pack, 2.75 @3.00; small, 2.25@2.50. Imperial Valley, 4.00@5.00. Arizonas: Seedless, 4.00@5.00, according to size and quality.

Lemons: Demand and movement moderate, market strong. Locals: Loose boxes, mostly 2.25@2.50.

Oranges: Demand limited, market steady. Navels, special brands, 1268-1768, mostly 5.00@5.50; 2008-2168, 4.50@5.00; market pack, 2.50@4.00, according to size and quality.

Tangerines: Demand and movement light, market steady; mostly 7@9; poorer, 5@6 lb.

GRAIN

Prices on L. A. Grain Exchange:

Milo, 1.60.

Barley, 1.32½@1.35.

HAY

Alfalfa Growers of California report: Business was active during the week and unusually large in volume for this time of the year. In Los Angeles the receipts by rail of alfalfa and grain hay were over 220 cars, of which much the larger part was alfalfa.

There were 2,250 tons of grain and alfalfa hay received on the Los Angeles tracks the week ending January 28, with 480 tons held over.

Prevailing prices last week, delivered in the vicinity of Los Angeles:

No. 1 dairy alfalfa.....25.00

Standard.....20.00

Quotations by Nichols-Loomis Company. Following are prices to growers f. o. b. Los Angeles in carload lots; handling and commission must be added to obtain retail prices on new hay:

OLIVER

ORCHARD TRACTOR PLOW

At New Low Price, \$154.70 Here

The No. 283 Oliver Plow is built especially for orchard or open field work. It is low, rigid and well braced; has no levers; will not injure low branches of trees. The power life feature is positive and durable. The front furrow wheel is set well ahead of the front bottom and the rear land wheel set within the cut of the rear bottom. Both axles are equipped with depth regulating stops. Also made in 2 and 4 bottoms.

You can not afford to use old, worn plows when you can buy Oliver quality at these low prices.

Treat Your Soil With Toro Brand Agricultural Sulphur

Improves alkali soil, transforms latent potash and phosphates into available plant foods.

Prevents wire worms, eel-worms or nematodes, smutty grain, ants, and potato scab.

220 lbs. per acre has increased crops up to 500%. For dry dusting, use "ANCHOR" Brand Velvet Flowers of Sulphur.

For Lime Sulphur Solution, use DIAMOND Brand Grand Refined Flour Sulphur. Sold by leading dealers.

Write for circulars Nos. 6 and 8, price list and samples. State for what purpose sulphur is to be used.

SAN FRANCISCO SULPHUR CO.

524 California St. San Francisco, Cal.

Brown Rot

can be controlled by the use of ORTHO POWDERED BORDEAUX. Add cold water and you have a standard Bordeaux mixture. Also, a valuable fungicide on other trees.

HAY AND FEED

A. W. Scott & Co. says: Arrivals past week, 953 tons. Receipts continue light and demand steady, with prices firm. Most of the receipts have been for direct order or export purpose, so that stocks have moved smoothly without accumulation and prices have been maintained. Good grades particularly have been readily disposed of at firm prices, although a poor quality is not in demand and sells slowly at prices considerably below those of the No. 1 grade. Alfalfa has been dull and uncertain. The week's transactions have been in Nevada hay, California holders anticipating better figures in the near future.

We quote today wholesale prices in carload lots as appear from dealers' transfers upon the markets in San Francisco (for prices to consumers, charges of switching, cartage, commission and handling expenses must be added, according to conditions).

Wheat hay No. 1	17.00@19.00
Wheat hay, fair grade	14.00@17.00
Tame oat hay	15.00@18.00
Wild oat hay	11.00@13.00
Alfalfa hay	13.00@16.00
Stock hay	7.00@10.00
Rollod Barley	29.00@30.00
Ground Barley	30.00@32.00
Oats, Rolled Feed	34.00@35.00
Bran and Millrun	25.00@28.00
Middlings	40.00@42.00
Coconut Meal	22.00@25.00
Alfalfa Meal	21.00@23.00
Cottonseed Meal	23.00@26.00
Sugar Beet Pulp	27.00@29.00
Molasses Tanks	17.00 Barr 25.00
Milo	35.00@38.00
Cornmeal and Cracked Corn	33.00@36.00
Scratch Feed	39.00@41.00

RICE

Rice Association prices:

Bag, 2.40@2.55 f. o. b. points.

GRAIN

Sales on Grain Exchange:

Corn: California yellow, 1.35@1.40; 1.25@1.27; No. 3 kafir, in bulk, 1.44@1.46;	

red milo, 1.52 1/2@1.57 1/2; do Eastern, 1.50@1.53.

Citrus Markets

Los Angeles, February 1, 1922.

Prices for oranges are advancing in the Eastern markets because of reports of frost damage to California fruit. At the time of the frost there were 1,500 cars of oranges shipped and unsold in the Eastern markets with several hundred more in the packing houses ready to go and prices on these are still advancing. The previous estimate of the Fruit Growers' Exchange on this damage is 40 to 50 per cent on oranges and 35 per cent on lemons. Florida is shipping around 100 cars each of oranges and grapefruit daily.

Shipments

Shipment of citrus fruits to date since November 1, 1921. Southern California: Oranges, 4,667 cars; lemons, 1,423; total, 6,090. To same date last season: Oranges, 4,375; lemons, 1,332; total, 5,707. From Central California to date this season: Oranges, 4,148; lemons, 73; total, 4,221. To same date last season: Oranges, 3,973; lemons, 66; total, 4,039. From Northern California to date this season: Oranges, 268; lemons, 7; total, 275. To same date last season: Oranges, 301; lemons, 3; total, 304.

WATER

FOR THE WHOLE FAMILY 2¢ A DAY

Everyone wants the home convenience of "water at the turn of a faucet"—hot or cold—for drinking, bathing, laundering, and other needs.

This new plant is automatic, simple, wonderfully well made—specially designed for constant home water service from a shallow well, cistern or spring.

FAIRBANKS-MORSE HOME WATER PLANT

is just what thousands of home owners have been waiting for. Just think of enough water for the whole family, daily, for the price of a postage stamp.

Go to Your Dealer
See this new plant—check it against all others for service, long life and price.

\$175 f. o. b. Factory—add freight to your town.

WESTERN CANADA

Land of Prosperity

offers to home seekers opportunities that cannot be secured elsewhere. The thousands of farmers from the United States who have accepted Canada's generous offer to settle on FREE homesteads or buy farm land in her provinces have been well repaid by bountiful crops. There is still available on easy terms

Fertile Land at \$15 to \$30 an Acre
—land similar to that which through many years has yielded from 20 to 45 bushels of wheat to the acre—oats, barley and flax also in great abundance, while raising horses, cattle, sheep and hogs is equally profitable. Hundreds of farmers in western Canada have raised crops in a single season worth more than the whole cost of their land. With such success comes prosperity, independence, good homes and all the comforts and conveniences which make life worth living.

Farm Gardens, Poultry, Dairying
are sources of income second only to grain growing and stock raising. Attractive climate, good neighbors, churches, schools, good markets, railroad facilities, rural telephone, etc.

For illustrated literature, maps, description of farm opportunities in Manitoba, Saskatchewan, Alberta and British Columbia, reduced railway rates, etc., write

Perforated Tree Protectors

Are you planting GRAPE CUTTINGS this season? We can save every one of them from rabbits, also every fruit tree from pest, hot sun and sand storms. We make a number of kinds. Tell us your pest. We will tell you what to use.

Collapsible Planting Pots

These pots are bottomless. This allows you to plant pot and plant, never disturbing the roots of the plant or stopping its growth a single hour in transplanting. For starting early vegetables, such as Tomatoes, Cabbage, Eggplant, Cucumbers, Cauliflower, Cantaloupes and Squash; also for Avocado, Carob Tree, Eucalyptus and Olive Cuttings. It's the most practical pot in use today for propagating work of any kind. Write us for samples and prices of both pots and protectors. Tell us which you are interested in.

OILPULL

"The Cheapest Farm Power"

Four Things to Look For When You Buy a Tractor

The Four Vital Factors shown here are absolutely essential to cheap farm power. Farmers have been demanding them for years. OilPull is "the cheapest farm power," because it has all four. These are the points you must have in your tractor to assure profitable service.

TRIPLE HEAT CONTROL—the Important Factor

The outstanding reason for the great success of Rumely OilPull Tractors is TRIPLE HEAT CONTROL—the only system that keeps temperatures of motor at the exact, right point for greatest efficiency on least fuel—at all times. Gets the power out of kerosene, stove tops, distillate and other cheap fuels. The only system in which the MOTOR GROWS COOLER AS THE LOAD GROWS HEAVIER. Overheating unknown. Freezing impossible. Makes possible an unqualified written guarantee to burn kerosene successfully at all loads and under all conditions, up to its rated brake horsepower. The local Advance-Rumely dealer will gladly demonstrate the OilPull suited for your work. In the meantime, we invite you to write for a copy of the catalog and our special booklet on Triple Heat Control.

Advance-Rumely Thresher Company, Inc.
17-19 Main St., San Francisco, Calif.

"The Advance-Rumely line includes kerosene tractors, steam engines, grain and rice threshers, alfalfa and clover hullers, and farm trucks."

Nation-Wide Service Through
29 Branch Offices and
Warehouses (73)

ADVANCE-RUMELY

- ① **Lowest Fuel Cost**
For 10 years an OilPull has held the world's official record for low fuel cost.
- ② **Lowest Upkeep Cost**
Investigation of many OilPulls shows average yearly repair expense of only half the national average found by the Government experts.
- ③ **Longest Average Life**
Hundreds of the first OilPulls have passed the 10-year mark and are still giving good service.
- ④ **Reasonable Price**
OilPull Tractors are always fairly priced.

SELECT Fruit Trees

Direct to You from Our Nurseries

For commercial planting we can supply Peaches, Olives, Pomegranates, Calimyrna Figs, Plums and some other kinds in quantities. Write for prices, naming quantity you expect to plant.

ALMONDS:—Our Almond stocks of all leading varieties, on peach or almond root, are still complete and we are prepared to make immediate shipment. Write or wire for price.

CITRUS TREES:—Thirty varieties, including Satsuma Orange, a hardy variety ripening before Christmas.

AVOCADOS:—Four of the best hardy varieties for planting wherever the orange will grow.

FEIJOAS:—New grafted varieties, hardy and large fruited.

GRAPES:—Forty best varieties, table and wine.

NEW LA FRANCE RASPBERRY:—Big, rich, sweet juicy berries from June to November.

MAMMOTH THORNLESS BLACKBERRY:—Largest and finest blackberry grown.

HOME ORCHARD PLANTING:—All the best varieties of all kinds of fruit trees.

Ornamentals

Stock includes big assortment of Decorative Trees, Vines and Flowering Plants of all sorts. **ROSES:**—Strong, field-grown plants—100 newest and best sorts, including Los Angeles, Mrs. S. K. Rindge, Miss Lolita Armour, William F. Dreer, Hoosier Beauty, Sunburst, Lady Hillingdon, Louise - Catherine Breslau and many others described in our catalog.

Send for finely illustrated catalog. Mail orders receive careful and prompt attention.

Distance Apart

AS there are varying conditions of soil, of habit of tree, of sufficiency of water, etc., there are varying opinions as to distances apart in planting. Recently this question as to peach trees came to the Cultivator and in order to have the best information from those most competent to give it we wrote producers and others in peach growing districts. Many of these have replied and their letters are quoted below.

First, however, a word as to "systems" of planting. We imagine that today 45 per cent of new orchard plantings are under the "square" plan. There are, however, four of these systems, namely, the square, triangular, hexagonal and quincunx. The square system gives the fewer trees to the acre at the same distance apart. It is claimed that theoretically the hexagonal system gives the same distance apart, the same room for root development and for top development and allows of setting nearly 20 trees more per acre than the square system. As a practical fact of growth, however, we do not think that roots or top recognize the slight advantage.

In any case, as noted, common practice is now almost exclusively to use the square planting, and, if anything, greater distance apart is given, especially to the stronger growing varieities of trees. From the letters quoted below it may be seen that the favorite distance apart for peach trees is still 20 feet, though some prefer 22 and even 24.

Fred C. Brosius, Horticultural Commissioner, Sacramento County:

Peach trees in this county are planted all the way from 16 to 24 feet apart. However, the consensus of opinion is that 22 feet is the proper distance.

Fred P. Roullard, Horticultural Commissioner, Fresno County:

The usual distance for peach tree planting in Fresno County is 20 by 20 feet. This is, in my opinion, the best distance for average plantings.

Fred K. Howard, Fresno:

Peach trees need not be planted farther apart than 20 by 20, except in very rich subirrigated soils which will promote a vigorous growth. Under those conditions 22 by 22 is preferable.

A. D. Poggetto, Manager California Canning Peach Growers:

It is very seldom that the trees are planted less than 20 feet. In fact, 20 feet is the usual planting distance, giving 108 trees to the acre. Some growers, however, plant 22 feet; but in this section (Yuba City), considering the extensive cultivation and complete irrigation systems, the 20 foot planting space gives excellent results.

C. K. Turner, Horticultural Commissioner, Placer County:

The most general practice in Placer County is to plant peach trees at 20 feet apart, either on the square system, giving 108 trees to the acre, or on the hexagonal system, giving 124 trees to the acre. Probably most of the peach orchards are planted on the

former system, and personally I think this is the best plan for our soils.

Charles F. Collins, Horticultural Commissioner, Tulare County:

Peach trees in this county are planted at various distances, many being 20 by 20 feet, some 20 by 22, and 20 by 24. More recent plantings are giving more room, as 24 by 24, which to my mind is a better distance on good peach soil.

A. E. Beers, Horticultural Commissioner, Merced County:

Formerly peaches were planted 20 feet apart. At present 24 feet is the popular distance, although some plant 22 feet apart in sandy land.

H. J. Ryan, Horticultural Commissioner Los Angeles County:

In this county peach trees are usually planted 22 feet apart, and from my own observations I believe that this is the best distance. According to our January reports we now have in bearing in Los Angeles County 5,981 acres and non-bearing 1,137 acres.

A Princess

The cow Princess Maida Veeman, No. 467343, owned by Earl Graham, Compton, has just finished her year's test with 29,631.2 lbs. milk and 1154.7 lbs. butter. This is a new world's record for milk by a margin of 1431.5 lbs. The record formerly held by

Princess Maida Veeman

Creamelle Topsy Ormsby Tobe was 28,199.7 lbs. milk. She is the daughter of Sir Veeman Korndyke Pontiac, a son of Sir Veeman Hengerveld, who is proving to be a wonderful sire.

She freshened on December 19, 1919 as a junior two year old and started on long time test January 1, 1920.

During her two year old record she worked under many difficulties, namely that she was moved around several times and was milked only three times a day. Still she made the excellent record of 20,274.1 lbs. milk with 760.5 lbs. butter. She was tested seven days, 11 months after calving, and made 15.36 lbs. butter from 402.2 lbs. milk as junior two year old.

As a junior three year old she freshened on January 25, 1921, being dry only 25 days and started on test February 1, 1921. She made in seven days 33.056 lbs. of butter from 666.6 lbs. of milk, her average test being 3.97. This gives her the remarkable record of 49,905.3 lbs. milk and 1915.2 lbs. butter made in 25 months. This in itself is another world's record.

During the year she has had 14 test periods one of which was a retest and another a verification. During her yearly test there have been eight different supervisors conducting her test.

Earl Graham has developed Princess and personally milked and fed her during the year, seldom being absent for even one milking.

Furrow Manure Treatment

By A. D. Shamel

Some of the Implements of Deep Furrow Manure Application

Upper photo: Home made horse drawn furrowing out plow for making manure furrows. It is an old subsoil plow fitted with wings made from well casing by blacksmith.

Center: Another type of home made horse drawn furrowing out plow for making manure furrows.

Lower: Under side of furrowing out plow showing details of construction.

In answer to the following letter from Norman K. Evans of the Valermo Orchard Company: "Your recent article in 'The California Cultivator' relative to furrowing manure into orchards has interested me greatly and I am anxious to try it on our orchards this year. But we cannot use tractors here, so I am writing to ask you whether you can tell me the name of a firm which makes plows suitable for this furrowing, which can be drawn by horses." Mr. Shamel sends to the Cultivator these photographs with explanation:

In reply to your question with regard to the furrow manure treatment, will say that many of the citrus growers who are using this method apply it without the aid of tractors. Several different ways of making the furrows with horse drawn implements are being used. One of these is a home made furrowing out implement, an adaptation of the ordinary subsoil plow for this purpose. Such implements have been made by blacksmiths who have used pieces of well casing or other suitable steel which have been bent and arranged so as to make a furrowing out plow of the middle buster type. I believe that if you will present your problem to your local blacksmith he will be able to take an ordinary subsoil plow and pieces of well casing or other suitable source of steel sheets and make a plow which will be, to all intents and purposes, satisfactory for your needs and which can be drawn by work animals.

Photographs show detail of the method of construction of a home made furrowing out plow. If it is not feasible to have made the kind of plow shown in these illustrations, it is entirely possible to make a satisfactory furrow for the manure, ordinarily, by making two rounds with an ordinary breaking plow. Therefore, I suggest that if you do not find it feasible to make or buy a horse drawn plow for your purpose that you use an ordinary plow and make two complete rounds in order to secure a furrow of satisfactory depth and width.

Agricultural News Notes of the Pacific Coast

Northern California

Price of jute bags has been fixed by the prison board at 7 cents till April 1.

Completion of the Los Molinos-Red Bluff highway will be celebrated by Red Bluff February 14.

W. H. Cudabalk will assist County Agent McCollum of Placer County in peach twig borer control studies.

Reports of frost damage to potatoes in the ground in the delta district resulted in sending up the San Francisco market.

Yuba County supervisors have been making strong representations to the state highway commission favoring the Tahoe-Ukiah highway.

Purchase of site of the Colusa plant of the California Prune & Apricot Growers has been authorized but construction will not start at once.

In 1921 there were received at San Francisco 795,068 cases of eggs from California points, 8,378 cases from Oregon and 7,302 cases from Washington.

The new Napa plant of the California Prune and Apricot Growers will handle fruit not only from Napa County but also lower Solano and Sonoma Counties.

Members of the Gold Hills farm center of Placer County are planning a good roads day when they will all turn in and put their roads in first class shape.

At the Pear Growers annual in San Francisco Frank T. Swett was re-elected president and manager; P. J. Huth, vice-president; F. A. Edinger, secretary-treasurer.

Asparagus growers of the delta section have completed their marketing organization, electing W. C. Kessner of Ryde president. Directors are: George W. Peltier, John S. Brown, Thomas McCormack, W. C. Kessner, E. L. Shelley, F. W. Wesley and J. W. Gardiner.

Central California

American Fruit Growers' Association has opened a branch office in Bakersfield.

The Manteca Cheese Company will build a cheese factory at Ceres, Stanislaus County.

Orange Cove, Fresno County, citrus association returned to growers \$3.51 per box on navels.

The Tulare Cooperative Poultry Association reports business for December totaled \$17,000.

Riverdale irrigation district is planning a bond election for \$125,000 to purchase canal property.

Reedley, Fresno County, has increased its quota of county farm bureau membership from 20 to 360.

The Stanislaus County Fair Association has decided that it would not be advisable to hold the usual fair at Modesto this fall.

F. A. Seymour has been made general manager of the Sun-Maid Raisin Growers and C. A. Murdoch assistant general manager and secretary.

The East Side Canal Company has distributed to irrigators near Bakersfield its 1922 schedule. Water will be delivered in not less than 24 hour periods.

Sun-Maid Raisin Growers, anticipating problems of marketing the 1922 crop, have sent special trade representatives to the East, Canada and Europe.

Delano is stepping out as a producer of fine lettuce. Several carloads were shipped early in January. It is estimated that 130 cars will be shipped within a few weeks.

The melon growers of the Turlock district of Stanislaus County have made a firm resolve that they will not sell another melon on consignment. Everything must be sold f. o. b. Turlock, for cash.

Southern California

The annual Iowa picnic reunion will be held at Lincoln Park, Los Angeles, February 22.

Santa Barbara County walnut growers are suggesting the next field meet be held in their county.

A tractor school will be held at the citrus experiment station, Riverside, February 27 to March 4.

The railroad commission has granted some slight concessions to commuters in the P. E. rate fight.

At the annual dinner of the Lankershim farm bureau (Los Angeles County) 225 gathered at the tables.

A Coachella Valley farmer says he received 35 cents a pound for string beans which he picked just before the freeze.

Report comes from Imperial Valley that within 30 days more than a million grape cuttings and rooted vines will be set out.

A farmers' tractor and gas engine repair school will be held under auspices of the farm bureau at El Centro high school, February 13-18.

Livestock clubs at Holtville, El Centro and Brawley are already planning to send judging teams to the Southern California fair at Riverside.

The Southern California Pure Bred Livestock Association will meet at Oxnard February 11. The local chamber of commerce will give a barbecue dinner in their honor.

Riverside district orange growers are feeling more optimistic daily over the frost damage situation. Shipments of oranges to January 21 for that section totaled 714 this year against 417 last year to same date.

Standardization officials have made several arrests of shippers of citrus fruits, charging them with having sent out fruit that has been condemned by the inspectors of the state department of agriculture.

The Coast and General

The broccoli crop of Clackamas, Oregon, was damaged by the cold weather.

Washington state fair closes its accounts for 1921 with balance of nearly \$22,000 available for 1922 activities.

Linn County, Oregon, farmers have voted to pay an annual membership fee in the county farm bureau of \$10.

The cheese output of Tillamook County, Oregon, in 1921 was 94,133 boxes. Twenty-five factories sell cooperatively.

Wellington, New Zealand, has a municipal milk distributing plant. It is planned to buy and operate the dairy farms to furnish their own milk supply.

The Washington Wool Growers Association held its annual meeting at Yakima, January 13 and 14. One important decision taken was to establish at Seattle a bonded warehouse to store 5,000,000 pounds of wool.

Argentine wheat for January and February shipment is being offered to Europe at prices 8 to 10 cents cheaper than American hard winter via the gulf. Germany is reported to have bought 7,250,000 bushels of this wheat in the last two weeks.

At the first meeting of the board of directors of the National Live Stock Producers Association, in Chicago, the following officers were elected: President, John G. Brown of Indiana; vice president, C. E. Collins of Colorado; secretary-treasurer, E. H. Cunningham, Des Moines, Iowa.

The Washington Growers Association, composed of growers of prunes in Clarke County, and which handles the crop on a cooperative basis, recently sent out checks totaling more than \$165,000 for part of the 1921 crop. The balance will be paid when the crop has been disposed of and the money collected. All expenses to date have been taken out of money already collected.

Avocado Growers Have Field Meeting

By V. F. Blanchard

AVOCADO growers held true to their regular form in attending in large numbers a field meeting on avocado culture on Wednesday, January 25, at Duarte. Frost injury to avocado trees apparently did not discourage growers, for the large attendance and the great interest shown indicated that it takes much to dampen the enthusiasm of an avocado grower.

The meeting was held under the auspices of the Monrovia-Duarte-Sierra Madre farm bureau center and was held at the Spinks avocado grove at Duarte. A terraced lawn above a leveled place made an ideal place for the meeting. Ralph Densmore, director of the farm center, presided and introduced Mr. Braunton, one of the pioneers in the avocado industry. His address in part follows:

"The ultimate consumer and the orchardist must both be considered in a general talk on avocados. Those who eat the fruits will first have flavor, for if flavor does not please they will not buy. The most enthusiastic advocate of the avocado must admit there are those who never will eat avocados, for not all persons find oily foods palatable and with our favorite fruit, as with olives, they will have nothing to do. It must be then that flavor is the first consideration. Granting that all varieties now generally planted are of good flavor, we may dismiss the subject, for those who eat many will in time learn to discriminate between the named varieties as to which most pleases the palate.

"The matter of per cent of fat content, relative size of seed, appearance of fiber coloring, size, form, color, all will be subordinated to flavor on the part of the ultimate consumer, though, like all fruits the avocado will sell on appearances and colored fruits will be given preference over those of any shade of green. In the end I believe a round or egg shaped fruit of about a pound weight with a black or nearly black skin or shell will prove most popular. Size of seed and per cent of fat will be considered by very few indeed.

"From the grower's point of view the chief consideration must be shipping quality, which is, of course, keeping quality; for whether marketed at home or shipped eastward the fruits must keep in good condition for several days after being picked and they must not be picked until mature. Not all the varieties we now grow will meet this requirement. In the case of purple or black varieties, picked after being colored and placed upon the local market where they are subjected to much handling, varying temperatures, etc., few will last more than two or three days in prime condition, especially if the weather be warm. The heavy shelled Guatemalans do, of course, keep best. It is in vain that some urge that because we ship fresh strawberries to New York City, all avocados will be considered equal. All strawberries are alike in protective covering, but if one of equal value could be found that would keep even one day longer than the other varieties, only that one would eventually be shipped.

"In planting it is essential to get balled trees having lots of soil about the roots, much more than is taken up with citrus trees of the same age. If not so furnished when offered for sale it would be better to plant seeds of the hardy Mexican type where they are to grow, two or three seeds to each tree location, bud one or two of the strongest and then leave only the one most vigorous or the only one upon which the bud has taken, for not all buds inserted will form a union. This method is a last resort as it incurs orchard expense from the beginning and young trees may be much more economically cared for in the nursery.

"A compromise measure and one somewhat followed is to plant seeds in large deep paper pots and plant out pots and all, either before or after budding the seedling. Of course the safest plan is to bud first and wait until assured the bud has taken before planting. It is known, however that we have nurserymen who dig balls sufficiently large and the only

admonition necessary is to advise planting of young trees rather than those two or three years from the bud.

"Regarding varieties it is better not to say much at present. So many good ones are coming to light that the list of the best half dozen or so will be constantly changing, and precedence in the list will also remain unstable. It is of doubtful wisdom to publish an official preferred list, and in the future I believe our committee on varieties will confine their reports to giving the good and bad points of those studied, for they will each year be confronted with a greater number of named and numbered varieties. This will not lessen their labors or the value of their recommendations so we must always have such committee and none are more competent for the work than the three now in

harness, Messrs. Adams, Hertrich and Barbour. In my own opinion I am doubtful, even now, of the leadership, in practically frostless places, of the Fuerte. It is much harder than the pure Guatemalans and recent low general temperatures assure it more general planting than that class. But in favored spots it is not the most vigorous tree or the surest annual cropper of those officially recommended."

Following Mr. Braunton's address requests came from the audience for talks from several prominent avocado growers. Their talks added much towards making the program a success. Numerous questions were asked on various problems pertaining to the avocado.

Mr. Densmore introduced the last speaker, Mr. Spinks, the host and owner of the grove. Mr. Spinks' part in the program was especially interesting, for he conducted the crowd over the place, showing points of interest. His grove has the reputation of being the most successful one from a financial standpoint in California.

He was one of the very first men to get into the industry. His success was assisted by the selection of an ideal site, for it is several hundred feet above the floor of the San Gabriel Valley on a small plateau, making it practically frost free. The grove contains over 1,700 trees, the greater portion of which are now old trees in full bearing.

Mr. Spinks led the crowd first through his wonderful plantings of ornamentals to a deep pond containing numerous black bass which were imported from the East, and then through a plot containing tropical trees. The fact that many of these were hardly touched by frost shows what an ideal place it is for avocados.

All were much interested in observing the experimental plot of avocado trees which were planted for Wilson Popenoe, the investigator for the United States department of agriculture. Most of these trees are not as good as the standard varieties, but a few are of good quality. They were of particular interest because of the

Bring Your Battery to Battery Headquarters

Your battery, no matter whether it is a Willard, or some other make, needs regular attention of the sort assured by Willard Standards of Service, and provided for the protection of all battery owners no matter where located.

Willard Standards of Service were formulated by Willard after experience with thousands of batteries of all kinds, used under all conditions. It's the sort

of service that adds most to the usefulness of Willard Batteries or any other make. It's the kind of service *your kind of battery needs.*

Every one of the Battery Stations listed below provides exactly the same service, treats you with the same courtesy, and gives you the same assurance that none but skilled, experienced men will be allowed to touch your battery.

EDITORIALETTES

No person ever entered more fully and faithfully into solving the difficult problems of the day than did Abraham Lincoln. It is well that on February 12 we Americans stop for a moment at least and consider the life of one of the world's most faithful workers. We, of this twentieth century, may be able to look upon those more accomplished and more polished but never upon a truer or greater.

* * *

Fred Maskew is ill at his home in Long Beach. Thousands of Californians who know of his long and faithful service in the state's plant quarantine work are all uniting in wishing for him early recovery. Nearly all of Mr. Maskew's life has been spent in either county or state quarantine work.

* * *

An inmate of San Quentin recently became so reformed and even gentle that he was paroled and went to his home. He quarreled with his wife and became so emphatic in his argument that she died because of injuries she received. A pardon board may be essential to the comfort of criminals and possibly at times necessary even to secure justice, but certainly indiscriminate pardoning of hardened criminals is resulting in contempt for California's method of law enforcing.

CRIMINAL WASTE

When the city of Los Angeles passed from pueblo days and became a small city it proceeded to build a conduit for disposal of its sewage. While the surrounding acres were short of both fertility and irrigation waters yet the city felt sufficiently rich to justify the waste of carrying the riches in water and fertility and dumping into the Pacific. The sewer was enlarged and again enlarged and is now bursting because of insufficient capacity. The food demands of the city have also increased and waters have been brought 250 miles and a limited quantity has been used for irrigation. Others brought over mountain and desert have been used and charged with fertility and then sent with the waters of the earlier day into the Pacific ocean. Now there are those who are moving for still further enlargement of the carrying capacity of the pipe.

The use of other waters has made of the county in which that city is located the greatest crop producer in the United States according to the census of 1920. And out of the abundance of its riches the city may feel justified in wasting these waters into the ocean. To those of us who know of the thousands of acres crying for more water and promising still greater return of crops if the water is supplied this suggestion of increasing our wasting abilities sounds criminal. Modern methods of handling sewage through septic tanks or reservoirs or of precipitating the fertility by chemical means make it possible to save and use the purified water and the fertility and at a profit. Why then should the voters of any great city burden themselves with twelve million dollars indebtedness in order to perpetuate this great waste?

SAVE OUR GOOD NAME

On January 21 citrus growers met and resolved to do no shipping of fruit picked after the cold wave of January 19 until the sixth day of February. February 6 growers met in Los Angeles and resolved almost unanimously to stand by the state department of agriculture in the regulations established by its standardization service. Some shippers have felt that opportunity for disposing of a crop at a fair price is to be lost if these rigid regulations are enforced, but it is most fortunate that the majority of the growers insist on protecting California's good name and the sending of only such fruit as will create a demand amongst consumers for more.

Since the above was written the announcement is made that a court action against orange shippers of Redlands has resulted in a ruling of the superior court of San Bernardino County in effect that the state department of agriculture has exceeded its authority in establishing its regulations. The shippers set up the claim that the department's regulations are altogether too arbitrary and that it will cost shippers large sums because of lost opportunity. However, the lesson of former years when shipments of frozen fruit have destroyed the market will be of value. It may be recalled that those shipments of inferior stuff completely destroyed the market so that later shipments of sound and attractive first grade fruit resulted in disaster. While it is probable the rigid enforcement of the department regulations may result in loss to a few the benefit to the state is incalculable.

AVOCADO GROWERS' MEETING

(Continued from Page 149.)

differences in degree of frost resistance, for some were not injured at all, while others were touched.

To those growers who have hoped for a profitable grove Mr. Spinks' grove of old trees of the Spinks variety was a sight to behold. It is perhaps the most uniform grove of good bearing trees in California. The trees are of good size and are in a healthy condition. They bear excellent crops year after year, which is indeed evidence of their being prolific and profitable.

Other varieties were also observed, some of which were in fruit while others already had their crop harvested. Avocados ready for sale were seen packed in boxes. Mr. Spinks is careful with packing fruit for sale.

It's Yours for the asking

Every farmer, rancher and orchardist should have Morse's 1922 Garden Guide. It is full of valuable planting information. Every Morse Seed is presented; in addition our novelties which we are featuring this season.

INSIST ON OLIVER QUALITY

NEW 1922 PRICE ON FIVE FOOT

OLIVER

Tractor

Disc Harrow

\$109.45

The construction of the Oliver tractor disc harrow enables the driver to control all four gangs from the tractor seat by turning a simple screw device which changes the angle of the discs or permits lightening of the load in difficult places.

The Oliver penetrates quickly and cuts full depth, and does not skimp the corners. It will not slue on the turns.

Self cleaning discs, well lubricated bearings and special hitch are distinctive Oliver features.

Made in 5, 6 or 7 foot widths with 16 or 18 inch blades.

Write for illustrated folders.

HARMONY IN CITRUS CIRCLES

LEADING citrus growers of the south met with state and county "enforcement" officials February 6 in the rooms of the California Fruit Growers Exchange to discuss the regulations of the state department of agriculture regarding shipment of frost injured oranges and lemons. It appears little or no fault was found with the state regulations, but some inspectors failed in proper interpretation of same.

Mr. Lyons of Redlands presided and stated the purpose of the meeting to be to find out what rulings the state department of agriculture proposed to make in regard to future shipments. Director Hecke was the first speaker. He has just returned from Washington and Florida. He said he was astounded at the citrus output of Florida during 1921, of 11,000,000 boxes as against 22,500,000 for California, and predicted that in the near future Florida will equal the latter figure. But they have no fruit standardization and lots of purple scale and other fruit-disfiguring pests. We must look well to keeping our standard of shipped fruit as high as possible in order to maintain our present fine reputation for the best oranges in the world. He stated he was in Washington during recent cold snap and F. W. Read of the standardization department made the provisional rulings and regulations sent out by the state department of agriculture. He further said the state had no end in view but the greatest good for all concerned and if the majority of those present would approve of other and better tests and rules he would adopt them.

F. W. Read then explained the regulations and called on Dr. Hills of the federal bureau of chemistry to state the government's ruling, made in 1913 and still in force. This is the same as adopted by the state and is the basis on which shipment of frosted fruit is restricted to 15 per cent or less showing cell injury through freezing. Dr. Hills said two cars shipped from here were intercepted and condemned at destination. One, at Kansas City, showed 26 per cent of injury and one at Little Rock, Arkansas, showed 20 per cent frosted. "If by any subterfuge your damaged fruit gets by us here we wire to destination and it is held up there, so why ship unsalable oranges." Mr. Chase of the National Orange Company, Mr. Brown, of Redlands, E. M. Chace, government chemist, and others spoke. A resolution, the last of many offered (and not voted on) finally passed almost unanimously, in effect that until some reasonable substitute is found the present regulations of the state department of agriculture should be upheld.

CITRUS INSTITUTE AT SAN BERNARDINO

The annual session of the California Citrus Institute will be held at San Bernardino in connection with the Twelfth National Orange Show on Tuesday, February 21. The program announced by President J. T. Barrett of the citrus experiment station includes papers on subjects of importance to the citrus grower at this time.

The institute date will make it possible for those attending to remain over for the holiday, Washington's Birthday, following to further view the displays at the Orange Show.

The sessions will begin at 9:30 a. m. and 1:45 p. m., and in addition to an address of welcome by Mayor S. W. McNabb, appointment of committees, reports and the election of three directors for full terms, the program will be:

Citrus Fertilization—A Résumé of Our Present Knowledge, by W. P. Kelley, citrus experiment station, Riverside.

Physical Problems in Soils, H. J. Wilder, county agent, San Bernardino.

Fertilization Experiments at Chaffey Junior College, C. J. Booth, Ontario.

In the afternoon session the addresses will include:

Scaley Bark of Orange Trees, H. S. Fawcett, citrus experiment station, Riverside.

Individual Tree Care, M. B. Rounds, Azusa Citrus Fruit Company.

Some Important Citrus Fruit Troubles, W. J. Ramsey, field department, California Fruit Growers' Exchange.

All sessions will be held in Elks' Hall.

YOU'LL USE PRUNES OFTENER ONCE YOU Know

A famous food authority [and he doesn't grow prunes, either] comes out with this sweeping statement: "Every well-regulated family should come to prunes in some form at least once a day." Why? Because he knows that prunes supply something you can get in no other way.

All these years you've been eating prunes—but how often? Chances are, not nearly often enough. Just because you live in California—the home of the prune—isn't the only reason why you should eat more prunes. The real reason is a selfish reason: the more prunes you eat the better your health will be!

You can't beat Nature at her own game. Nature creates. Nature regulates. Nature's way is *always* best. Nature intended prunes for a purpose. Let Nature point the way!

Once you realize how essential prunes are to the health of your household you'll *want* to use them oftener. And once you realize how many *new* dishes can be made from them, you won't stop at stewed prunes. You'll *start* there—as most folk do every morning—but you'll learn to use them in other ways—for puddings, for pastries, for unusual desserts. Our new Recipe Packet shows you how—and it's free! Send for it today!

1

PRUNES are just coming into their own. And with good reason: people are just awakening to their health-importance. Your diet demands some good fruit every day. And prunes fill the health-bill more completely, more economically, than any other fruit.

2

PRUNES are a natural food to begin with. They contain more digestible natural sugar than any other fruit. And this fruit-sugar is quickly turned into energy for the body.

3

PRUNES, so food authorities tell us, contain tonic iron and other mineral, "vitamin" and laxative elements that help to give the proper "balance" to every diet.

4

PRUNES have certain salts and organic acids which improve the quality of the blood and counteract the acid-elements in meat, eggs, cereals and other "high-protein" foods.

5

PRUNES are so essential to good health and right living that physicians, dietitians, domestic scientists the country over are urging: "Eat more prunes! Know them better! Serve them oftener! They're good for you!"

IN ANSWER to requests for
information as to feasibility
of commercial canning of
marmalade juice:

We have prepared several
hundred cans of the product in our
own commercial laboratory at the uni-
versity. We use equal quantities of
lemons and oranges. We slice these
and boil them with water for about 45
minutes. We then press out the re-

sulting juice and concentrate it by
boiling to a Balling degree of about
10. The concentration will vary some-
what with the condition of the fruit
used. In some cases it may be as low
as eight degrees Balling and in others
as high as 12. The object of the con-
centration is to increase the pectin
content to such a point that two cups
of sugar may be added to one cup of
the juice and the mixture boiled ex-
actly two minutes for the production
of a stiff jelly or marmalade. We
then slice orange peels very thinly
and boil them in water until tender.
We add enough of these thinly sliced
boiled peels to the juice described
above to give a proper proportion of
peels to the juice for marmalade. If
the peels are very thin this will cor-
respond to about ten per cent by
weight. If the peels are relatively
thick it may require as much as 15
to 20 per cent by weight. Very thinly
sliced peels are the more desirable.
Primary trials of one or two pints of
the mixture should be made by boil-

ing with two volumes of sugar and
one of the mixture. We believe that
the pectin should be rich enough to
give a jelly with this proportion of
sugar. The mixture is then heated
to boiling and filled into lacquered
cans boiling hot. The cans are sealed
and processed in boiling water for
about ten minutes after which they
are thoroughly cooled in water. In our
estimation any cannery that is
equipped for the manufacture of to-
mato puree or tomato catsup can un-
dertake without very much expense
the manufacture of this new product.

The market for this product would
be among the housewives of the
United States to make it possible for
them to prepare in their own kitchens
in a few minutes time fresh flav-
ored marmalade. I may say that
we have given samples to more than
20 different families in Berkeley and
the opinions expressed by those who
have used the product have all been
favorable. Many of the faculty mem-
bers have signified their intention of
buying one or two dozen cans of the
product as soon as we have sufficient
of it prepared for sale. We therefore
sincerely believe that the product has
commercial possibilities.

It is not necessary that the product
be so highly concentrated that two
cups of sugar can be used to one of
the mixture. We prepare this high
concentration for the reason that it
reduces the chances of failure on the
part of the housewife.

We also believe that this product
could be canned in gallon and five
gallon cans and sold to marmalade fac-
tories throughout the United States.
The additional proportion of lemons
above that ordinarily employed in the
manufacture of marmalade gives a
light colored, fresh flavored and
clearer product and one that is practi-
cally free from the disagreeable stale
orange flavor that characterizes so
much of the commercially produced
marmalade.

These investigations have covered
a period of over five years. We have
utilized not only cull fruit from all of
the orange growing sections of the
state but have also used frozen fruit
successfully.

BE NATURAL: SAY "I"

By William M. Bristol

THE CULTIVATOR is a jour-
nal devoted to the practical
things of rural life and I
not supposed to concern my-
self with the mode of ex-
pression of its contributors so long
as they are concise and intelligible.
But the editor has given me permis-
sion to say a word to those bright but
over-modest young men who invari-
ably avoid the use of the pronoun "I".
I have just finished reading the cur-
rent issue of a horticultural magazine
containing a half dozen articles in
each of which the writer speaks of
himself in the third person; and I
am thereby prompted to make this lit-
tle pedagogic suggestion. Not that
I have ever been a pedagogue—it is not
necessary to be a language teacher in
order to notice an awkward expres-
sion. I am sure that none of the writ-
ers I have mentioned, if standing be-
fore and addressing an audience
would refer to himself as "the
speaker," but would use the natural
and proper first personal pronoun, "I".
In ordinary conversation any suc-
cessful avoidance of the natural form of ex-
pression would be sure to attract at-
tention rather than to divert it from
the speaker. And, by the same token,
it is a needless circumlocution to say
"the writer's" opinion or experience
or whatever it may be, when the pro-
noun "my" would answer every pur-
pose. I am sure that none of the
readers of the excellent articles I have
just perused would have accused the
writers of egotism had they addressed
them in the conversational manner
instead of in the stilted phraseology
of the third person. And so—knowing
that I am older than any one of them
and therefore privileged to speak
frankly—I say: Fear not; be natural
say "I".

I trust that none of the boys to
whom I am speaking will refer to the
editor's plural "we" in defense of the
use of the phrase "the writer" in lieu
of "I". The editorial mask was in-
vented in the cave-man days of jour-
nalism, when brilliant and fearless edi-
tors were so frequently ambushed
that the publishers were compelled to

resort to this method of protecting them. Anyhow the editorial is, properly, the opinion of the journal and its owner and publishers and therefore takes the plural form, the reader usually preferring not to know the personality of the author. But the reader's interest in the contributed article depends in large measure upon the individuality of the writer—and the writer, therefore, should not seek to hide his identity.

Fear not; be natural; say "I".

TWELFTH NATIONAL ORANGE SHOW

By E. M. Gore

Citrus growers of California will reap a rich reward in the displays at the twelfth National Orange Show to be held in San Bernardino, February 17 to 27. The educational values of the exhibits to the producers cannot be too highly estimated.

Each year the progress made in the growing of citrus fruits is recorded at the show. The displays are a barometer of the industry. Each year since the inception of the fair the quality of the fruit has increased. This year much may be gleaned from the various exhibits throughout the fair that will tend to further a desire for better fruit—if any more perfect may be attained.

This year there will be more plate and rack exhibits than ever before. It is these that attract the grower. Although he may be passively interested in the startling feature exhibits which please the untrained eye of the eastern visitor, the quality, quantity and beauty of fruit is what interests the producer. While the tourist may gaze with enraptured eyes upon the color and size of the fruit the judges want to know more about the contents of each specimen.

Each orange, lemon or grapefruit is casually observed for size and color and is then opened to determine the thickness of the skin, the amount of water, sugar, acid, etc., contained. Each specimen is subjected to a rigorous examination, the judging itself being an interesting side light for the grower.

It gives producers of all districts a chance to compare the fruit from their region with that of the other districts.

One of the displays that is expected to be particularly interesting to the growers this year will be that of the citrus experiment station at Riverside. This exhibit will comprise more than 250 varieties of citrus fruits. Officials of the station have been working for years obtaining slips and trees from all parts of the world, breeding and cross breeding, and propagating every known kind of fruit.

Other educational features for the producers will be talks by prominent citrus men upon various phases of production. During the show the California Citrus Institute will be held. Many fine talks are on the program and it is stated that the entire institute will be devoted to educational features of a highly interesting nature.

Throughout the entire industrial section will be found features of interest to the growers. New methods of cultivation, propagation, disease combating and practically everything connected with the industry will be displayed. Every conceivable kind of a by-product will be shown in a mammoth crystal palace. There will also be the automobile section where the prospective buyer may investigate trucks, tractors and automobiles.

FARM MANAGEMENT SCHOOLS

Farm management schools are scheduled for Los Angeles County at Whittier, February 15; Downey, 20; Baldwin Park, 21; Van Nuys, 23; Lancaster, 24. Farm accounts and income tax returns will be given special attention.

A mass meeting of beekeepers is called for February 18 at 10 A. M. at State Exposition Building, Los Angeles, to consider formation of a beekeepers department of the Los Angeles County farm bureau.

A Powerful Foe To Orchard Pests

The General Chemical Company is the West's most powerful foe to the insect and fungus pests of the orchard.

Modern laboratories, skilled chemists, scientific methods, and raw materials of the best grade are all employed by this big concern in its war on the profit-destroying vermin of orchard and vineyard.

This organization specializes in chemicals. Its earnest attention is devoted to producing products that are safe, efficient and uniform—products that can be depended upon to exterminate the pests of tree and vine.

In addition to aiding the ranchers by manufacturing effective fungicides and insecticides, entomologists are employed by the Company to give ranchers counsel regarding the pest problem. Every rancher is cordially invited to take advantage of this service.

Use Orchard Brand Spray Materials

This Company's products are made in the West to conform with Pacific Coast requirements. They have long been used by experienced ranchers who know them to be beyond the experimental stage. It will pay you to use—

- Orchard Brand Lime Sulphur Solution,
- Orchard Brand Bordeaux Mixture,
- Orchard Brand Arsenate of Lead,
- and Universal Oil Sprays.

Write for interesting booklet and learn how to prevent pest troubles which will be sure to occur in time unless precautions are taken.

For Every Farm Job

No matter how many tractors, or how many types of tractors, you have seen—you'll find the new Cletrac (Model F) astonishingly new and different. So simple in design, so easy to operate and maintain—it has such a decidedly all-year usefulness not ordinarily looked for in a tractor that it will actually cause you to figure tractors all over again.

The new Model F Cletrac is a real all-round tractor. It plows, discs, harrows, seeds, cultivates, harvests and does all kinds of belt work. And consider that it is only 31 inches wide, 50 inches high, 83 inches long and weighs only 1820 pounds.

Its capacity for work is enormous—plows 6 to 8 acres a day—discs 15 to 20—harrows 20 to 25—and withal it is so simple, care-free and accessible.

A few minutes of practice and you have mastered its operation. Every part is easily accessible. An automatic oiling system makes oil and grease cups unnecessary. Chrome steel—the toughest material obtainable—is used for all parts subject to wear, and it is equipped with a sturdy, powerful 4-cylinder kerosene, distillate or gasoline burning motor.

The new Model F Cletrac is without equal for day in and day out, all-job usefulness and dependability. For utility, quality and price it is an unprecedented value.

See your local Cletrac dealer or write our nearest office for full information.

Hard this way,
but—

Easy on a track
The Cletrac Way

1. Handles every farm job.
2. Plows 6 to 8 acres a day using any 2-bottom 12-inch plow.
3. Every part subject to wear constructed of chrome steel—weighs only 1820 lbs.
4. Automatically lubricated—no grease or oil cups.
5. Simple, care-free design—burns kerosene, distillate or gasoline.
6. Every working part quickly accessible.
7. Unprecedented value at \$875 complete.

Model "F" Cletrac is made in four sizes: 31 inches wide, with 8 inch clearance; 41 inches wide, with either 8, 14, or 18 inch clearance.

Queries Answered

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Walnut Leaves for Mulch

Are the leaves that fall from English walnut trees an injury to the trees when plowed under? Do they in any way cause what is called walnut blight? Some of my neighbors are gathering up all the leaves and burning them. I plow them all under thinking they make a good mulch.—Subscriber, Pasadena.

We would surely plow the leaves under. Extensive experiments conducted by Professors Fawcett and Batchelor, and reported by them in the monthly bulletin of the department of agriculture for May and June, 1920, show that where prunings of badly diseased twigs are taken from the tree, carefully gathered and burned, there is but little, if any, lessening of blight over checked plots which were not pruned or sprayed. We believe that by plowing under you would put them so far below the surface that there would be no more spreading of the disease and possibly not as much as from raking and gathering together in piles to burn. Would also suggest that our inquirer write Agricultural Experiment Station, College of Agriculture, Berkeley, and ask for Bulletin 332, "Walnut Culture in California," which may be had without cost.

Burning Stumps

In answering a query some time ago you mentioned burning of stumps to get rid of them. What is the method? I find the piling of brush not effective because nearby citrus trees prevent big fire.—Subscriber, Orange.

The "char-pitting" method is often used. In following this practice it is necessary to excavate at least one side of the stump. If this is done in summer time where there is some drying out prior to the burning it is more effective. When the tree is cut one or more auger holes may be drilled in the top and the holes plugged with saltpeter. Water is poured in to partially dissolve the saltpeter and the upper tissues of the stump become saturated and more combustible as the stump dries out. After the excavation at the side is done a few sticks of wood in the bottom of the hole soon get the stump into a glowing coal. When fire is largely burned out it may be covered as in the making of charcoal and allowed to smoulder until the stump is entirely consumed. If there is difficulty in getting a stump to burn some follow the method of boring a hole down the center, putting in a light charge of dynamite and shattering the stump so that it will then burn readily. There are so many successful stump pullers these days that many prefer to use them and have the land available at once. The "char-pitting" method is fully explained in Bulletin 101, issued by the State College of Washington, Pullman, Washington.

Grading Eggs

What is the best way to grade eggs for market?

Grades established are 14 to 18 ounces to the dozen for pewees, 18 to 22 for pullets, and 22 and above for extras. Of course this is presuming they are clean and uniform in color.

Tree Whitewash

A few weeks ago I read the formula for preparing a whitewash that would remain on the hen house a long time. I think it was in the Cultivator, but am unable to find it in looking over the copies. Could you kindly give me the formula again, so I may try it on our chicken houses this winter?—Subscriber, San Gabriel.

See page 316 of the issue of September 24, 1921, for three different formulas for tree whitewash. In addition, where one wishes the higher grade article for outbuildings, the so-called "government" whitewash may be used. Formula is as follows: Slake half a bushel of unslaked lime with boiling water, keeping it covered dur-

boiling water and boiled to a thin paste; half a pound of powdered Spanish whiting and a pound of clear glue dissolved in warm water. Mix these well together and let the mixture stand for several days. Keep the wash thus prepared in a kettle or portable furnace, and when used, put it on as hot as possible with painter's or whitewash brushes. The washes which contain milk, flour or glue are not to be advised for use in damp, interior places, owing to danger of decomposition of the organic matter. For such locations it is better to use one of the formulas containing none of such ingredients. Whitewash is applied with a broad whitewash brush and is spread lightly over the surface, no attempt being made to brush it in as in the case of an oil paint.

Fulfilling Contract

If I take a contract for paying \$20 a month to a company from which I have bought shares will they force me to pay the full amount? I wish to drop it because I cannot meet my payments. I am short of money.—Subscriber, Turlock.

This depends entirely upon the wording of the contract. Presumably, however, the contract can be enforced and also probably provides for continuing payments until the completion of the purchase. However, it is probable arrangements may be made with the company to cancel the contract.

Father's Right to Earnings

In case sons and daughters are earning and making payments on contracts to purchase land or improvement on land which is in the name of the father may they still claim the portion of money they have earned and paid in case of death of the father if he should make no will? Or could the eldest son take possession of the land?—Subscriber, Turlock.

Legally the property stands in the name of the father and in case of his death would pass to all the heirs unless those who have advanced money could furnish definite proof that the amount advanced was their own separate property. Strictly legally also earnings of minor children may become the property of the parent. If the parent so wishes he can protect the rights of those who are earning the money making a just division of the estate by will.

Lost Use of Windmill

If a neighbor has a row of eucalyptus trees so close to the line that they prevent my windmill from operating can he be compelled to remove them?—Subscriber, Ceres.

Since the windmill will operate we fear that strictly legally it would be impossible to secure removal of these trees. The best way would be to arrive at an agreement with the neighbor. However, there have been decisions in the matter of trees near the line where injury from roots and shade has caused loss to adjoining land and the courts have held the owner of the trees responsible and assessed damages. In addition decisions have been rendered that such trees are a common nuisance and ordering their removal. But this we believe has been in cases where actual damage to the crops or to the soil has occurred. This matter of loss of the use of windmill has, so far as we know, never been tested.

Poinsettias

Please tell me a few things about poinsettias. I have a young plant in a pot and the leaves have dropped off. Is it the right time for pruning? If so, how should it be done? I have considered planting it out in the open ground when warmer weather comes. What exposure should it have? Should it be where it would get the morning sun, or afternoon, or must it have sun all day?—Subscriber, San Marcos.

Potted poinsettias may be pruned when in the present condition of yours, but usually pruning is deferred until warm weather, say April 1. Then the cuttings are planted either in boxes of sand or in the positions they are wanted permanently. The plants do best in the hottest places and in full-sun.

Wherever water is to be lifted

ON the banks of the Nile, the sugar plantations of Java, the gold mines of Alaska and the diamond fields of Kimberly, Byron Jackson pumps are serving. There is nothing romantic about the rugged, carefully machined Byron Jackson pump excepting the story of its service. Since 1878 these pumps have been following man to the remote corners of the earth.

Far away from the reach of even the extensive Byron Jackson field service, these pumps have fulfilled the trust of men who depended upon them for faithful service.

These same dependable qualities are a recommendation to those here in the market for a high grade centrifugal pump.

More Raisins When Work Slackens

—a Good Rule on the Farm

Another Luscious Way

Another way to get the benefit of raisins is to serve them stewed, with cream as a regular breakfast dish.

Try this way, too, and note the results in ten days.

Sun-Maid Raisin Bread

3 cups flour, 4 teaspoons baking powder, 1 teaspoon salt, $\frac{1}{4}$ cup sugar, 1 cup Sun-Maid seeded raisins cut in pieces, 1 egg, 1 cup milk.

Soak raisins in boiling water for 15 minutes. Drain and dry. Sift flour, baking powder, salt and sugar together. Add raisins. Mix beaten egg with milk and add to flour, stirring constantly. Pour into greased bread pans. Let stand for 10 minutes and bake in moderate oven for 40 to 45 minutes.

This makes two small loaves or one large loaf.

All measurements for this recipe are level.

Blue Package (Seeded), best
for Pie and Bread.

IT'S very easy when you bake to put raisins in the bread. And there's double reason for it when farm work is slack.

For raisins have a mild laxative effect and are rich in food-iron, which helps build up the blood.

Daily exercise is Nature's best way to keep you in condition. Lacking exercise her next best method is the use of well chosen foods.

The sugar of the raisin and the bulk and roughage of the skins are of real aid in avoiding constipation.

Then Nature has put into raisins the eight most needed mineral salts—phosphorus and iron particularly.

So in this delicious fruit food you have incomparable flavor and a health value that no one should overlook.

We print a simple recipe for luscious raisin bread. Try it next time you bake bread. See how good it is—and how good for you.

SUN-MAID RAISINS

Always ask for Sun-Maid Raisins, made from California's finest table grapes, yet costing no more than ordinary raisins. Seeded, blue package (seeds removed) best for pie and bread; Seedless, red package (grown without seeds) best for stewing; Clusters (on the stem), a luscious, quick dessert.

Raisins are 30% cheaper than formerly. See that you get plenty in your food.

THE FARM GIRL'S VALENTINE

By May Brown

He—
If I were a singer with voice divine,
And I sang, in melting accents, "Be
mine,"
Would you deign to look, as I knelt
at your feet,
And give to me one little smile, my
sweet?

If I in the writer's Who's Who could
shine,
And rake in the shekels, a dollar a
line,
When I tried to depict how lovely
you are,
Would you grant me a single
thought, oh my star?

If I were an artist whose glowing
brush
Could enshrine your eyes and your
dear cheek's blush
In the heart of a canvas, so all might
see
Would you give just a word to
humble me?

She—
Oh pshaw, Henry Jones, you are blind
as a bat,
If you haven't been able to see where
you're at.
In jumper and overalls, milking a
cow,
You're the man I love, and I'll marry
you now!

UPSTAIRS

(Continued from last week.)

Then as the seconds passed and no further sound was heard, the first start of nameless fear and dread that swept over him subsided, and he told himself that there could be nothing of which to be afraid, that perhaps something stored away had fallen to the floor or a heavy laden bough had dumped its burden of snow on the roof. To suppose anything else was nonsense.

Yet it took courage to put his foot upon the next step. For the first time he noticed, with a feeling of uneasiness, how dark and gloomy it was within the close shuttered room. And in the opening overhead this twilight darkness was even more intense. As he reached the third step, the stairs creaked beneath his weight. Then a cold draft struck his face, and the unmistakable shuffle of feet came from overhead.

He stopped short. There was no doubt now but what he was not alone in the cabin. His hand reached mechanically for his hatchet helve; his gun was back in the kitchen. The footfalls came swiftly across the floor, and his weapon was hardly in his hand before the outline of a catlike head and shoulders appeared at the opening, and a pair of savage eyes threw back the reflection of the greater light below.

For a long moment they stood thus facing each other, the mountain cat and the boy. Then the boy stepped slowly backward. Cold fear clutched him. He had not lived months alone in the mountains without learning something of the ways of the big cats that made their home among them. While he knew that often a mountain lion will show itself a coward, he knew, too, that there were times when the beast will openly take a stand for its rights, and when it does, there is nothing like it in all nature for strength and power and fierceness.

Rael retreated. But at the first backward move, the cat uttered a low warning growl, and thumped an angry tail against the boards. Another step, and the signs of disapproval grew more threatening. Should he stand and fight, or make a dash for his gun? Mentally he traced each detail of the course to the point where he had left the weapon, and weighed his chances of success.

As he hesitated, he heard the rasp of the sharp claws as they sank deep into the wood; the creature was crouching for a spring! At that a sort of panic seized Rael. He was at the very breath of leaping sidewise from

the stairs in a rush for his rifle, when another angry growl this time from behind, froze him to his tracks.

Watching the glowing eyes above, he saw them shift their gaze and focus on some object to his rear. Not daring to move, he stood there, though his ears caught the sound of stealthy creeping at his back. Then came the growl again, rising and falling in wrathful intonations as cat answered cat, lashing themselves to the fury of assault.

Two cats in the same building! The cabin must be their den, and Rael had escaped one death only to meet another. He could see the fierce form above crouching for its spring.

Rael never knew quite how it happened, it was all so instantaneous, but as the big cat in front of him unleashed itself, he half dodged, half fell, from the stairs, and the plunging cat soared above him.

Despite his fall, he saw the other, with jaws extended, rise to meet the jumper. They came together breast to breast, the impact bringing them to the floor with a force that shook the building. It broke them apart, too, but quicker almost than eye could follow, they closed again, and the cabin was filled with their screaming as they bit and tore and leaped and tumbled. All over the place they fought their battle, while the boy hugged the wall beneath the stairway, not daring to move. A single sidelong spring would carry one or the other halfway across the room. Sometimes they rolled together in a clinch upon the floor, revolving so fast that it was hard to say which might be uppermost. At other times, reared on hind legs, they tussled like two wrestlers in a ring, till one would lose his balance and they would go to the boards again. A table leg snapped like a toothpick as their combined weight came against it, and all movable things were like straws before a whirlwind. Once one of the furry warriors toppled over backwards almost at Rael's feet, and the other was at his throat before he could rise. Yet even as the gleaming fangs would have closed, stout hind legs tore into the attacking party's vitals.

It was a deadly conflict, with quarter neither asked nor given. Fascinating it was in its power and terrible, yet frightful and abhorrent. To see two splendid beasts ripping and clawing each other, and making the air resound with their shrieks of rage and pain, is not a pleasant spectacle. Only a savage heart can find enjoyment in it.

To Rael, crouched beneath the stairway, against which the heavy bodies sometimes thudded, there was nothing of pleasure in the sight, yet perhaps little of repulsion, for his dominant emotion was fear. As the combat continued to rage, however, and no harm came to him, he began to take more interest in it and to plan for his escape. The fight could not last forever. And when it was finished, then it would be his turn. He could not wait till that happened.

Two possible ways of escape lay open to him—the stairway and the kitchen. Had he known what he afterwards knew, it would not have taken him long to decide in favor of the stairway. But he feared he might only put himself into a trap, and so he chose the kitchen. It was just as he saw one of the big fellows fairly break the neck of the other with a terrific sweep of the paw, and close for the finish, that he made his dash and safely reached his gun.

From the other room came a spasmodic thumping sound, and he knew that one of the big beasts was beating out its life upon the board floor. At once he pushed the curtain aside, and clutching his gun firmly, stepped into the blood splashed arena.

The victor lay licking the wound of battle, almost within paw's reach of the vanquished. At sight of his new foe, one of those strange contradictions of animal nature seemed to possess the cat, and with a single powerful bound it gained the stairway, and almost reached the top when Rael fired. The shot hit its mark, but did not prove fatal, for the cat reached the top and vanished.

Rael waited for some time, listening, but hearing no sign from above, it fin-

ally occurred to him that there might be some means of entrance that he had not yet discovered. He would see, anyway. He approached the stairway and went cautiously up. He found the broken window and sagging shutter, and could see the cats trail upon the snow, where it had leaped to the roof and thence to the eubankment, for the cabin was backed close up to the slope of the hill, and from this pitch it was possible to leap to the low roof of the kitchen. A window from the chamber over the living room opened out on this roof. The heavy branch of a tree, thrown against it in some storm, had knocked loose the shutter and worked considerable havoc. One of the prowling cats evidently discovered and made use of so convenient an entrance to ideal winter quarters. The other cat, a stranger, had doubtless arrived by accident, coming in through the open window, either on the fresh man trail and in general search of what he might find, or enticed within by the smell of cooked food.

The second cat, after entering the building, might have slunk away and left him entirely alone had it not been for the presence of the first. But scenting the other cat and then coming upon it ready to fall upon her prey, was little short of a challenge to a hungry stomach. Hence it was that each, though interested in the boy, gave attention to the other.

He made the place secure against any further invasion, and there spent the winter. Mountain lion steaks may

I dreamed last night you promised
To be my Valentine!
If ev'ry dream were just like that,
Say! Wouldn't dreams be fine?

not be particularly tender and appetizing, but when frozen at least served to stave off hunger until the storm abated and more palatable game could be secured. Of the big cat that had made its escape he never saw further trace unless the tracks he found about the cabin one morning a few days later belonged to the cabin's late tenant. He rather hoped they did, for the animal's defense of its home had been most gallant.

HINTS FROM HOUSEKEEPERS

Orange Marmalade
This is the only recipe for orange marmalade I have seen that will not grow bitter:

Five pounds or 6 large oranges, 5 quarts cold water, 5 pounds sugar. Slice fruit, using all the orange except the ends. Let stand in water, uncovered, 24 hours. Boil five minutes after coming to the boil. Let stand again 24 hours, then add the sugar and boil until thick enough. Put in glasses and cover with paraffin or tops.—Mrs. H. E. B., Galt.

Lemon Pie
1 cup sugar, 1 tablespoon butter, 1 tablespoon cornstarch, 1 cup hot water, juice and grated rind of 1 lemon. Cook this part until it thickens, then pour over the beaten yolks of 2 eggs. Pour this mixture into a baked crust and place a meringue on top made of the 2 egg whites beaten with 4 table-spoons sugar, and bake until brown.—Subscriber, Lompoc.

My Favorite Cake
½ cup butter, 1 cup sugar, 2 cups flour, 3 eggs, 3 level teaspoons baking powder, ½ cup milk, ½ teaspoon flavor. Cream butter well, add sugar and beaten egg yolks, milk, extract, flour and baking powder, and lastly the beaten egg whites, reserving the other two for the icing.—Subscriber, Lompoc.

"Chicken Fried My Way"
Cut up the chicken as for frying and roll each piece in flour. Have the pan and shortening (lard and butter) on the stove and fry the chicken in it until it is nice and brown. Then on the back part of the stove have a stew pot ready with a little butter in it, and as you take the chicken out of the frying pan put it in the stew pot. When all is cooked put a little water in the pot to keep from sticking or burning, and season it with salt and pepper and let steam for about half an hour. But as the water dries up keep putting more in it until ready to serve, then take the fried pieces of chicken up and thicken the gravy. Have

mashed potatoes to serve with this.—Subscriber, Lompoc.

Prune Cake and Prune Pie
We use a great many prunes in our family, especially at this time of the year. They are so rich and satisfying. We seldom have them for breakfast as so many do, but prefer them for dinner or supper. In the morning we like grapefruit or oranges or some acid fruit better. I really think mothers make a mistake in urging their children to eat stewed prunes for breakfast with cereal and cream and milk or hot chocolate to drink. We like them better as a dessert at the later meals in the day when we are all hungrier.

Prune Cake—1 cup sugar, ¾ cup butter, 3 eggs beaten separately (save the white of 1 egg for frosting), ½ cup prune juice, 1 cup chopped cooked prunes, 1 teaspoon soda, 1 teaspoon baking powder, 2 cups flour, 1 teaspoon cinnamon, 1 teaspoon allspice, pinch nutmeg. Add ingredients in the order given.

Prune Pie—1 cup sour cream, 1 cup chopped prunes, ½ cup sugar, 2 egg yolks, 2 tablespoons flour, 1 teaspoon each nutmeg, cloves and cinnamon. Mix ingredients and cook until thick. Pour into baked shells and cover with meringue made of whites of 2 eggs.

HOUSEHOLD QUERIES

That Salami Recipe
Many thanks for the recipe on the "sausages." That is not what I wanted, but thank you just the same. The

recipe that I want calls for wine, salt-peter, cinnamon, cloves, salt and other spices. They are very good. Will watch your columns very closely. I am sending you a few of my favorite recipes. Hope they will do some one good.—An Old Subscriber, Lompoc.

We hope that some of our Cultivator housewives will be able to furnish the recipe called for. Ask your friends and tell them that in return for such a recipe the Cultivator will send them one year's subscription, which is the very best dollar's worth they will ever get. Mrs. C. M. Throop of Santa Rosa sent us a salami recipe which was published in last week's Cultivator, which is excellent, but our Lompoc subscriber wishes to know particularly about proportion of spices to use.

PETER AND MARJORAM MAKE A SONG

PETER had been over to tell the man next door about his first trip to the dentist. "Marj'am," he giggled, "guess what the man next door said? He said if he was running things he'd take every boy and girl and pull out every other tooth, so when they wanted to clean them they could just take some water in their mouths and whoo-sh it around and their teeth would be clean and they'd never have to go to the dentist ever."

"Ugh!" said Marj'am, "I think he's horrid. Don't you think he's horrid, Mother? And Peter is, too! Ugh!"

"Aw, he was just joking," said Peter. "Wasn't he, Mother?"

"I think," said Mother, "what he really meant was that you need to keep your teeth clean, outside and inside and in between and all around, and then the dentist won't have to pull out your teeth ever."

"Outside, inside, every in-between-side," chanted Marj'am, who was always making up songs about everything. "It does make a song, doesn't it, Mother?" And she hopped up and down and skipped around the room, singing "Outside, inside, every in-between-side."

Peter's hand went down in his pockets and on went Peter's thinking cap. And pretty soon Peter's perky grin announced that the thinking cap was working nicely.

"I know a song, too. Listen, Mother, see if it isn't:

"Brush 'em brisk, brush 'em clean,
Use a lot of lathery cream."

"Of course it is," said Mother. "Why don't you and Marjoram put your two songs together and see how that sounds?"

"Outside, inside,
Every in-between-side;
Brush 'em brisk, brush 'em clean,
Use a lot of lathery cream."

Evidently Mother had on her thinking cap, too. "And you could call it 'The Brushing Song.'"

"Oh, let's call it 'The Peter-Marj'am Brushing Song,'" cried Marj'am, "because it's our own song, isn't it, Mother?"

And then Peter went off into a per-

In keeping the dairy and farm buildings sanitary—the orchard and fields free from insects and plant diseases, extreme care must be taken to select the right cleansing agents and spray materials.

Likewise in caring for the teeth, progressive farm families, through their dentists and physicians, have learned that the most desirable dentifrice is one which "cleanses" naturally. They select one that doesn't "scratch" or "scour" the teeth with soapless grit.

COLGATE'S CLEANS TEETH THE RIGHT WAY

The combined action of non-gritty, specially prepared chalk and pure soap cleanses thoroughly and does not irritate the delicate mouth tissues or "scour" the precious enamel.

So, if your teeth are "on edge" from using a harsh, gritty, soapless tooth paste, try a safe, common sense dental cream. Try Colgate's Ribbon Dental Cream with its delicious flavor that makes tooth brushing a pleasure—there's no disagreeable "druggy" taste.

More dentists recommend Colgate's than any other dentifrice. You can get a large tube of Colgate's Ribbon Dental Cream at your store for considerably less than fifty cents.

If you wish samples of the other Colgate products mentioned in the coupon, check those desired and mail it to us.

fect gale of laughter. "B-but we can't sing it when we're brushing our teeth b-because our mouths'll be busy."

Marj'am looked disappointed because she does so like to sing things. Then on went her thinking cap and

pretty soon she was hopping and skipping again and singing:

"Outside, inside,
Every in-between-side;
Brush 'em brisk, brush 'em clean,
Use a lot of smelly cream."

"We can sing it out loud now, and when we brush our teeth it'll just sing itself inside our heads."

"But it isn't 'smelly cream,'" protested Peter, "lathery cream."

"You can sing 'lathery cream,' if you want to," said Marj'am, "but I'm going to sing 'smelly cream,' because I just do like things that smell nice."

POEMS ASKED FOR

"Father Calls Me William—"

I am anxious for the remainder of two poems I used to know when a school girl. Do not remember the name of either. One starts like this: "Mother calls me William, Father calls me Will, Sister calls me Willie, but the fellers call me Bill," etc. The other: "Pa and Ma are Methodists, and all us children, too." Also if you can suggest to me some book that has a goodly collection of live pieces that take well to give as readings I would certainly appreciate it.—Subscriber, Perris.

The first poem requested is Eugene Field's "Jest 'Fore Christmas." "Pa and Ma are Methodists" the librarian expects to be able to find for us later. General collections for readings the librarian suggests are: "Pieces for Every Occasion" (holidays, anniversaries), Le Row; "Classic Selections," Curry; "Recitations, Dramatic and Humorous," Hasluck; "Choice Readings for Public and Private Entertainments," Cumnock. These may be found in most public libraries. Riverside has a county library, and no doubt you could secure them through it.

JEST 'FORE CHRISTMAS
By Eugene Field

Father calls me William, sister calls me Will,
Mother calls me Willie, but the fellers call me Bill!
Mighty glad I ain't a girl—rather be a boy,
Without them sashes, curls, an' things that's worn by Faunteroy!
Love to chaw'nk green apples an' go swimmin' in the lake—
Hate to take the castor-ile they give for bellyache!
Most all the time, the whole year round,
there ain't no flies on me,
But jest 'fore Christmas I'm as good as I kin be!

Got a yeller dog named Sport, sick him on the cat;
First thing she knows she doesn't know where she is at!
Got a clipper sled, an' when us kids goes out to slide,
'Long comes the grocery cart, an' we all hook a ride!
But sometimes when the grocery man is worried an' cross,
'He reaches at us with his whip, an' lar-rups up his hoss,
An' then I laff an' holler, "Oh, ye never teched me!"
But jest 'fore Christmas I'm as good as I kind be!

Gran'ma says she hopes that when I git to be a man,
I'll be a missionarier like her oldest brother, Dan,
As was et up by the cannibuls that lives in Ceylon's Isle,
Where everly prospect pleases, an' only man is vile!
But gran'ma she has never been to see a Wild West show,
Nor read the Life of Daniel Boone, or else I guess she'd know
That Buff'lo Bill an' cowboys is good enough for me!
Excep' jest 'fore Christmas, when I'm good as I kin be!

And then old Sport he hangs around so solemnlike an' still,
His eyes they seem a-sayin', "What's the matter, little Bill?"
The old cat sneaks down off her perch an' wonders what's become
Of them two enemies of hern that used to make things hum!
But I am so perlit an' tend so earnestly to biz,
That Mother says to Father: "How improved our Willie is!"
But Father, havin' been a boy hisself, suspicions me
When jest 'fore Christmas, I'm as good as I kin be!

For Christmas, with its lots an' lots of candies, cakes, an' toys,
Was made, they say, for proper kids an' not for naughty boys;
So wash yer face an' bresh yer hair, an' mind yer p's and q's,
An' don't bust out yer pantaloons, an' don't wear out yer shoes;
Say "Yessum" to the ladies, and "Yes-sur" to the men,
An' when they's company don't pass yer plate for pie again;
But, thinkin' of the things yer'd like to see upon that tree,
Jest 'fore Christmas be as good as yer kin be!

European Sycamores

THE EUROPEAN SYCAMORE (Platanus orientalis) is beyond question one of the best shade and avenue trees in California. The tree is perfectly hardy and cannot be injured either by heat or frost and is practically free from any injurious insects and such pests. It is a very long-lived tree and is adapted to a wide variety of soil conditions. The Sycamore will thrive with very little water if it is only given the proper care in becoming established. It can be allowed to go untrained into an enormous tree or it can be pruned down into almost any form desired. It does not sucker from the roots as some other trees do. Its shade is very dense on account of its natural compact growth.

New Lamp Burns

94% Air

Beats Electric or Gas

A new oil lamp that gives an amazingly brilliant, soft, white light, even better than gas or electricity, has been tested by the U. S. Government and 35 leading universities and found to be superior to 10 ordinary oil lamps. It burns without odor, smoke or noise—no pumping up, is simple, clean, safe. Burns 94% air and 6% common kerosene (coal-oil).

The inventor, V. S. Johnson, 31 N. Fifth St., Portland, Ore., is offering to send a lamp on 10 days' FREE trial, or even to give one FREE to the first user in each locality who will help him introduce it. Write him today for full particulars. Also ask him to explain how you can get the agency, and without experience or money make \$250 to \$500 per month.

PACKERS OF AIRLINE HONEY

SIMPLE AND DEPENDABLE

Throughout the agricultural sections of the West, and especially in California, where water development is such an important factor, the powerful, economical, direct connected to electric motor deep well turbine is winning a host of advocates.

The Byron Jackson Iron Works, pioneer producer of deep well turbine pumps, reports that the volume of business in this particular type of pump indicates that the time is not far distant when the deep well turbine will be regarded as the standard pump on the average farm.

The accompanying illustration shows a typical Byron Jackson deep well turbine installation in Santa Clara Valley. The average depth of these plants is anywhere from 50 to 200 feet, the horsepower varying from 20 to 100.

This view is of particular interest, showing as it does the Byron Jackson direct connected head and the method of wiring to conform to the "safety first" regulations of the state industrial accident commission. This method of pumping is rapidly winning because of its simplicity, dependability and the little attention required.

BERYLWOOD FARM ENTERTAINS STOCKMEN

The Berylwood Stock Farm of Hue-neme will entertain the breeders of purebred livestock of Southern California at luncheon today, Saturday, February 11. This luncheon will be served in the splendid modern dairy barn at the Berylwood Farm and the

Chamber of Commerce and Rotary Club of Oxnard will join in entertaining the visiting stockmen.

A great interest is being taken in the work of the recently organized Southern California Purebred Livestock Association. A definite program was outlined at a recent meeting of the organization held in Los Angeles, to interest the farmer and small rancher in the introduction of at least purebred males; the enactment of some needed legislation in the interest of the breeder and the installation within the organization of a selling program which will tend to facilitate the more general sale of blooded stock.

The agricultural development of Southern California hinges upon the successful development of the livestock industry and, in turn, the successful development of the livestock industry hinges very decidedly upon whether or not the class of livestock introduced and raised is of the character which will yield the best product in the shortest time and with the least feed. Therefore, the success of the livestock development depends very materially upon the general acceptance of the purebred animal on the farm.

TOP GRAFTING DEMONSTRATIONS

A series of five field demonstration meetings on top-grafting of deciduous and walnut trees has been arranged for by the agricultural extension service for Los Angeles County. February 27, 10 A. M., Baldwin Park, place of B. R. Dix; 2 P. M., Pomona, 1671 S. Park St. February 28, 2 P. M., Van Nuys, Vanowen and Woodman Sts. March 1, 2 P. M., Athens, place of Mrs. M. N. Jackson. March 2, 1:30 P. M., Littlerock, Sheldon-Lancaster Ranch.

At these meetings the importance of top grafting certain deciduous varieties such as plums and pears to secure cross pollinations and eliminate boarders will be discussed. The latest methods of top grafting will be shown, the demonstrations being conducted by Farm Advisor Hodgson. It is hoped to have representatives of the citrus experiment station for handling the walnut grafting.

STEADY SAWING—AND GOODYEAR BELTS

"In my twenty years of farming, twelve years of it with different kinds of belting, the only belt I have ever had that would drive a saw resistlessly through two-foot box elder and ash is the Goodyear Klingtite Belt. The one I have, has been performing faultlessly for four years now."—J. W. CURTIS, Farmer, Little Sauk, Minnesota

"Say nothing, but saw wood" is the motto of the farmer who has a Goodyear Klingtite Belt. His belt troubles, from slippage and shrinkage and breakage, are over. He has a powerful, close clinging, long wearing belt.

The Goodyear Klingtite Belt is efficient and economical because it is specially designed and constructed for farm power service. It is built sturdily to stand the sudden stresses to which farm belts are subjected. It is built to endure changing weather conditions.

It needs no breaking in. It requires no belt dressing. It runs with a loose, free action that favors the engine bearings. It does not stretch or shrink so as to require frequent re-setting of the engine. It wears evenly, without a trace of ply separation, and lasts a long, long time.

You can get Goodyear Klingtite Belts from your Goodyear Dealer for any farm power drive. For further information about Goodyear Klingtite Belts write to The Goodyear Tire & Rubber Company, Akron, Ohio, or Los Angeles, Calif.

GOODYEAR

Copyright 1922, by The Goodyear Tire & Rubber Co.

What is more annoying—to the milker and to the cow—than trying to get a full milking from udder or teats that are tender and sensitive or hard and congested.

Prompt application of Bag Balm, the great healing ointment to any cut, scratch, chap or inflammation quickly heals and keeps the tissues soft and pliable, so that milking time is a pleasure to the milker and comfort for the cow.

Use Bag Balm for Caked Bag and all abnormal conditions of the udder tissue. It penetrates quickly and restores healthy circulation. Valuable in treating Cow Pox and Bunches.

Big 10-ounce package, 60c. at feed dealers, general stores and druggists. Write for free booklet, "Dairy Wrinkles."

MORE MILK from YOUR COWS

Photo taken at Glenlea Farm, Winnipeg, Can.

Users of Empire Milking Machines report increased milk production

NINE gallons more milk a day than by-hand milking—that is the record of Van W. Nail's Empire Milker.

An average increase of 3.31 pounds per day from one cow and similar increases from the others of his registered Holstein herd is recorded by Walter Zeller of Delavan, Wis., with the Empire. He says: "The Empire Milker produced a larger flow of milk than I was able to obtain by hand milking."

The letter printed above from Mr.

Nail is but a sample of hundreds of proofs showing that the Empire greatly increases milk production. The Empire Milking Machine sold with its famous four year *guarantee* on the pulsator not only increases production of milk, but cuts labor costs from 35% to 50%. It begins paying for itself immediately and brings in new profits every day.

The Empire is now selling at the lowest price since it was first placed on the market more than a decade ago.

It is a money making machine for every farmer who has six or more cows. Find out how much you can save by installing the Empire on your farm. Write for catalog 52M today.

State Dairy Cow Competition

List of cows producing 50 pounds of butter fat or more during December: Arden Dairy, grade Holstein, 982—1,178 pounds milk, 60.08 pounds butter fat.

Anita M. Baldwin, Holstein—Lady Lilith Walker De Kol, 2,099 pounds milk, 74.73 pounds butter fat. J. A. Genzoli, grade—Dollie, 784 pounds milk, 53.31 pounds butter fat.

Nate Hauck, grades—Red, 787 pounds milk, 58.24 pounds butter fat; Speck, 840, 53.76; Lily, 675, 51.98.

C. D. Hayworth, Jerseys—Harriet of Rico V, 795 pounds milk, 51.07 pounds butter fat; Lorna of Rico V, 739, 52.05.

Peter Iversen, grade Holstein—Holstein heifer, 784 pounds milk, 54.10 pounds butter fat.

Palo Alto Stock Farm, Holstein—Kiatta Pontiac Pride, 2,337 pounds milk, 65.43 pounds butter fat.

M. L. Pontoni, grade Jersey—Klam-

ath, 877 pounds milk, 66.65 pounds butter fat.

The reports for December so far received show that 225 cows in milk during the full month produced an average of 547 pounds milk and 30.08 pounds butter fat (average number of days in milk at the beginning of the month, 253). The highest producing cow for the month was a pure bred Holstein, Lady Lilith Walker De Kol, owned by Anita M. Baldwin (2,099 pounds milk, 74.73 pounds butter fat, at 195 days from freshening). Three cows produced between 60 and 70 pounds fat during the month and seven between 50 and 60 pounds.

The prize offered by the California Cultivator for the highest average production by five grades for December was won by Peter Iversen of Grizzly Bluff, Humboldt County. The average production of his five highest

herds in different parts of the state that competed for the Cultivator prize the past month. The average production of only one other group came above 40 pounds, viz., grades owned by M. L. Pontoni of Arcata, whose production averaged 45.64 pounds butter fat for the month.

The following cows completed the record period of ten months (305 days) in the competition during the past month. They are given in the order of their owners, alphabetically arranged, except for the record cow for the month, which is placed first:

(1) 294 days, (2) 283 days, (3) 303 days, (4) 275 days, (5) 289 days, (6) 273 days, (7) 245 days, (8) 295 days, (9) 285 days, (10) 266 days, (11) 272 days, (12) 276 days, (13) 261 days, (14) 244 days, (15) 243 days, (16) 304 days, (17) 293 days, (18) 299 days, (19) 302 days, (20) 271 days, (21) 255 days, (22) 300 days.

Owners of Cows: No. 1, Earl Graham, Compton; 2-9, Adohr Stock Farms; 10-18, Arden Certified Dairy, El Monte; 19, Berylwood Stock Farm, Hueneme; 20-31, Eug. Blondini, Ferndale; 32, J. M. Christen, Pacheco; 33-35, J. W. Coppini, Ferndale; 36, S. J. Damon, Ferndale; 37-39, L. A. Driver, Nicolaus; 40-50, W. F. Early, Grizzly Bluff; 51, M. J. & B. A. Edwards, Ripon; 52-59, J. A. Genzoli, Loleta; 60, H. G. Gross, Eureka; 61, J. A. Harbers, Waddington; 62-63, Fred Hartsook, Lahkershim; 64, Nate Hauck, Alton; 65, C. D. Hayworth, Modesto; 66, S. A. Mitchel, El Monte; 71, Palo Alto Stock Farm, Palo Alto; 68-82, Walter Terkelsen, Ferndale; 83-84, R. H. Walrath, El Centro; 85, Warne & Sons, Holtville.

As previously announced, the competition closed January 31, after having been in progress since September 1, 1920, a period of 16 months. The awards of the prizes offered will be announced and the presentation of cash prizes, silver trophies, etc., will take place at the evening session, February 23, of the Dairy Farmers' Conference during Stockmen's Week held at the university farm, Davis. Farmers and breeders who have participated in the competition, as well as donors of prizes in the competition and the general public, are cordially invited to be present at this and other sessions of the conference. An excellent program with addresses and discussions by leading dairy authorities will be offered at the conference, insuring all dairy farmers who attend a highly interesting and profitable meeting. The same holds true as regards all who attend the meetings of the stockmen during the entire week. University farm, Davis, will be the Mecca of California livestock men and dairy farmers during the last week of February.

This is the last monthly report of the competition that will be issued. The compilation of records made in the competition are not likely to be completed much before the Davis meeting and the list of prize winners will be made public through the press at that time. It is planned to give the history, main results and teachings of the competition in a bulletin of the college of agriculture, to be published as promptly as practicable on the completion of the competition.

DAIRY MEETINGS

A series of dairy meetings under auspices of the farm bureau will be held in Los Angeles County at Van Nuys high school, February 13; high school Lancaster, 14; County Farm, 15; Pomona (I. C. Hostetler place), 16.

General program: Dairy Equipment and the Handling of Market Milk, Dr. J. J. Frey, state department of agriculture. Economical Feeding of Dairy Cows, Prof. E. C. Voorhies, University of California. Tuberculosis, Dr. J. P. Bushong, dairy inspection, Los Angeles. Contagious Abortion and Sterility, Dr. J. A. Woodside.

Sam H. Greene, manager of the California Dairy Council, will discuss the council's method of securing greater profit for the dairymen. Dairymen attending will be given the opportunity to bring up other questions. There will be specimens and demonstrational material used in connection with the discussion on disease work in dairy cattle, and dairymen should not lose this opportunity to get firsthand information on the above mentioned subjects.

A Star "Gothic-Roof" Barn

Going to Build or Remodel a Barn?

If you are, you want to talk to us and we want to talk with you.

First of all, we'll give you, free of cost or obligation, complete blue prints (floor plan, elevations and outside drawings) and full detail of the barn you should have to fit your needs.

—and we'll show you how Star Barn Equipment pays for itself—how it cuts down the work—increases milk yield and keeps the herd healthier. And we'll prove what we say by the testimony of dairymen right in your section.

United States patents protect the exclusive features that put Star Barn Equipment in a class by itself—you will find these advantages in no other brand. For instance, the Unit

System which enables you to add stalls as your herd grows—the Star Alignment Device which keeps bedding and stalls clean and lessens labor—the Star Curb Clamp which cuts down installation cost—these and many other features you would not be without are exclusive with Star.

In the Star Line, you'll find more than merely Steel Stalls and Stanchions—everything for the barn, inside and out, is there: Water Bowls, Pens, Ventilation Systems, Litter and Feed Carriers as well as Harvester Hay Tools, Cannon Ball Door Hangers, Hoghouse Equipment, Garage Door Fixtures and a world of other farm specialties.

Our 348-page bound catalog, profusely illustrated in colors, is free if you'll write for it and tell us when you're going to build a new barn or remodel your old one. Our Plan Department is at your service, free. Use the coupon for plans. Write for the catalog.

POULTRY

Baby Chicks—When you buy baby chicks the big thing for you to remember is **QUALITY**, in both the chick itself and the parent stock. By investigating you will find that our chicks are in a class by themselves; for we have absolutely the best equipment obtainable to produce them and very high class stock from which we get our eggs, and then, too, we know how to handle and deliver chicks. We are hatching every week White Leghorns and Anconas that will lay; R. I. Reds and Barred Rocks that are well bred and will produce. Send for our circular and prices and order immediately for 1922 delivery. **ORANGE COUNTY HATCHERY**, Santa Ana, California.

Walter Hogan Stock White Leghorn Chicks. December and January chicks come from winter layers. The cockerels are in the market for early broilers. You can have the chicks out of the brooder house in time to put in a Spring brood. We are hatching the chicks and ship by Parcel Post, safe arrival guaranteed. You can do what others do—make money with poultry. **Lyon Hatchery, Gardena, California.**

We Are Now Booking Orders for S. C. White Leghorn Baby Chicks, from strong, healthy, vigorous stock. Bred especially for heavy egg production, from two hundred to two hundred and eighty egg strain. If you want strong, healthy baby chicks, place your orders with the **Vineburg Hatchery**. All baby chicks guaranteed safe delivery. **Vineburg Hatchery, Vineburg, California.**

Baby Chicks from Petaluma Electric Incubator have "Pep" that surprises customers. Electricity is life. Modern poultrymen are rapidly adopting our system with splendid results. Safe, efficient, economical, better chicks. Hatch for yourself or get chicks from hatcheries using Petaluma Incubators. Write for our free catalog. **Petaluma Electric Incubator Co., Petaluma, California.**

Santa Cruz Chicks—Our Specials are White Leghorns, Buhrman's White Wyandottes and "Hill Crest" Reds, but also hatching, choice Brown Leghorns, Anconas, Buff, White and Black Minorcas, Barred and White Rocks and Reds, Buff Orpingtons. Interesting folder ready. **B. W. Archibald, Soquel, Santa Cruz County, California.**

White Leghorns—Eggs for hatching our specialty, produced right, selected right, shipped right; 100 per cent fertility guaranteed. A laying strain of proven merit. Prices very reasonable. Send for folder "Secret of Success." **Curtis White Leghorn Ranch, R. 1, Box 29, Gardena, Cal.**

After the First Week

By Jean A. Koethen

THE first week has been called the critical time in the life of the baby chick, but this statement must be made with reservations. As far as the vigor and vitality of the chick itself are concerned it is true. A few days of warmth and quiet establish the little creature in its hold on life, which is very insecure at first. If it lacks the vigor to pull through the first week and make a start at growing the sooner it drops out of the race the better. When it has learned to eat and has become hardened to the cooler air of the brooder it is ready for a rapid and most interesting development. Whether it is able to go on as it has begun depends entirely on the environment which is thrown around it.

Nature's Way

Study the life of a chick on range with a hen mother for a minute. It has fresh air from the day it is hatched, unlimited opportunity for exercise, a warm place to sleep, bugs and worms and green things to eat, new interests to keep it running and playing from morning till night. If its coop is kept reasonably clean, and its mother free from lice, such a chick will thrive on almost any fare. It

Green Range

Limited green range is possible for even the largest flocks. Nearly all poultrymen plan to have a yard of growing barley ready for the chicks as soon as they are ready for it. The chicks are not allowed out of the playroom the first week. The second week they are kept in a small yard where they can easily be controlled. By the end of the second week, unless the weather is severe, they are ready for the barley field, and wonderful growth they make, nibbling the tender green and picking the bugs and gnats in its shade. If the barley is not pretty well grown it will not last long; the taller it is before the flock is turned in, the longer it will last and the more good will the chicks get from it. The size of the barley patch will depend, of course, on the ground that is available. The bigger it is the more nearly will natural conditions be approached.

Chard, kale, lettuce, cut barley and any other available greens should be fed in the yard in addition to the barley that is pecked off the growing grain. Limiting green feed is very poor economy.

POULTRYMAN'S CALENDAR—FEBRUARY, HATCHING THE CHICKS

February is the best hatching month in the year in California. Chicks may be hatched in any month, but fall layers must be hatched early, and those hatched in February make rapid growth and reach laying maturity at just the right time.

Brooders and coops should be ready to receive the chicks at least two days before the hatch comes off. The brooder stove should have been lighted 48 hours and heat kept at a steady temperature. When the eggs begin to pip on the 19th day sprinkle them with warm water then close the incubator door till the hatch is over. If mothers should be kept quiet on the nest these last 48 hours, preferably in a darkened place.

Chicks should not be removed from incubator or from under hen till they have been out of the shell 48 hours. This resting time is very important. When they are removed all possible care should be employed to prevent chilling.

Chicks are not fed until they are 60 to 72 hours old. Charcoal, grit and sour milk or fresh water are kept before them from the time they are put in the brooder. The morning of the third or fourth day fine commercial chick feed is placed before them in trays.

Warmth, cleanliness, exercise and simple food are the essentials in successful chick raising.

does not overeat of mash and chick grain, because more palatable feed is always before it and exercise keeps its digestion working normally.

How different is the life of a brooder chick, one of several hundred or perhaps of a thousand or so! It has no interest in life outside of eating and quarreling with its brothers and sisters, no chance to exercise save in limited quarters and always in a crowd, far less than its normal supply of oxygen. Worst of all, its food is set before it all prepared, and it has nothing to do but stuff it down. To overcome these handicaps and raise 90 to 95 per cent of the chicks that go into the brooder is no easy task. That it is done every year by hundreds of poultrymen speaks volumes for their intelligence and devotion.

It is impossible in commercial chick raising to surround a flock of chicks with its natural environment, but it is possible to approach in some degree that environment and to mitigate the handicap which growing up in a large flock places upon every chick.

First, brooder or brooder room can and must be kept clean—just how clean depends on circumstances. When chicks are under a hover at night droppings should be cleaned out and fresh litter put in every morning. When they are brooded without a hover around a stove it may be impossible to change the litter every day, but it should be done as often as cleanliness demands it. Chicks cannot sleep night after night in the foul odor of neglected droppings without suffering.

Second, overfeeding can be guarded against by a very gradual change from the grain ration of the first week to the grain and mash of the month old chick. The poultry division makes this change by putting the growing mash before the chicks for only two hours a day at first. This is from 10 to 12 a. m. Chick grain is thrown in the litter night and morning, and greens are given in the middle of the day. If sour milk is available it is kept before them in fountains. The time the mash is left before the flock is very gradually increased till by the end of a month they have it all the time.

Avoid Overcrowding

Brooder stoves have almost solved the problem of overcrowding. The brooder room contains far more air space than is needed when the chicks are first hatched, and they gradually grow up to it. If good sized outdoor runs are provided, a room 12 feet square, with playroom the same size, will accommodate 500 chicks till the cockerels are removed at the age of six weeks. Many poultrymen keep the pullets in such a house till they are ready for the laying house, but they do better if they are removed to colony houses and kept in flocks of not over 50 through the summer. Where colony houses are not practicable, the pullets may be removed to the laying house after the cockerels are sent to market.

When brooders are used, in which flocks of 100 chicks or less are kept under a single hover, the overcrowding problem is more acute. A chick doubles its size in about three weeks. If its brooding space is not also doubled the chick will be stunted. It is therefore necessary when this type of brooder is used, to have three times as much brooder space as is needed at the start, and divide the flocks every few weeks as the chicks increase in size.

Changing the Ration

The change from chick grain to whole grain is one that the beginners sometimes find difficult. This change is most easily effected by mixing a little whole wheat and Egyptian corn with the chick feed almost from the first, and gradually increasing the amount. It is surprising how soon the chicks will begin to eat whole grains and how soon they prefer it to the chick feed. I had one brood that would never eat chick feed. Having no chick feed for them at first, I threw them whole wheat, and before I could get the chick feed for them they had grown accustomed to the whole wheat and refused the other. This experience convinced me that there is no need of keeping chicks on chick feed very long. Certainly there is nothing to be gained by feeding chick feed to chicks that will eat whole grains. Cracked corn should be a part of the grain ration of all growing stock.

ing to be gained by feeding chick feed to chicks that will eat whole grains. Cracked corn should be a part of the grain ration of all growing stock.

Chickens Sick? Hens Not Laying

There's no excuse for roup, colds, cancer, sore head, chicken pox, skin disorders, cholera, indigestion, bowel trouble and such ailments. **GERMOZONE** positively will rid your chickens of disease and keep them healthy. For over 50 years the dependable remedy and preventive. Get Germozone and Lee's FINE BLOOD-LETTERS, which explain proper feeding and care and how to keep hens laying regularly the year round. At drug or seed stores. If no dealer, order by card. 75c and \$1.50 sizes. Send no money—Postman will collect. No extra charge.

SEO. H. LEE CO., Dept. F-30 Omaha, Neb.

The Cause of White Diarrhea

White Diarrhea is caused by the bacillus *Bacterium Pullorum* transmitted through the yolk. There is scarcely a hatch without some infected chicks. The germs multiply very rapidly and one infected chick may infect the entire brood. The germs can be killed by the use of preventives. Intestinal Antiseptics to kill the germs should be given as soon as the chicks are out of the shell. It is much easier to prevent than it is to cure.

How to Prevent White Diarrhea

Dear Sir: I have raised poultry for years and have lost my share of little chicks from White Diarrhea. Finally I learned of Walker's Walko Remedy for this disease, so sent for two 50c packages to the Walker Remedy Co., Dept. 596, Waterloo, Iowa. I raised over 500 chicks and never lost a single one from White Diarrhea. Walko not only prevents White Diarrhea, but it gives the chicks strength and vigor—they develop quicker and feather earlier. I have found this company thoroughly reliable and always get the remedy by return mail. Mrs. L. L. Tam, Burnetts Creek, Ind.

Don't Wait

Don't wait until White Diarrhea gets half or two-thirds your chicks. Don't let it get started. Be prepared. Write today. Let us prove to you that Walko will prevent White Diarrhea. Send 50c for box on our guarantee—money back if not satisfied. **Walker Remedy Co., Dept. 596, Waterloo, Ia.**

When Writing Advertisers Please Mention Cultivator.

Wheat, Egyptian corn and milo may be mixed with it, and wheat should always be a portion of the mixture. Given wheat and cracked corn as the foundation of the scratch feed, it does not much matter what else is used.

A good growing mash is used from the second week till the pullets are ready for the laying mash at about five months of age. If rolled oats are added to this mash at first there will be better development of frame and muscle, and ground oats should be a part of it. Whole oats may be sprouted and fed at noon after the chicks are three weeks old. Oats are one of the best feeds for bulding frame.

The gradual accustoming of the chicks to the dry mash is for the purpose of avoiding coccidiosis, which many poultrymen believe is the result of overfeeding mash at first. The digestive organs of a young chick cannot handle an unlimited amount of mash; it sours in the crop, and an unhealthy intestinal condition results,

which can only be overcome by the use of sour milk.

Cleanliness Vital

The importance of cleanliness to the growing chick cannot be overestimated. Clean ground to run on, clean air in the brooder, a clean place to sleep at night, clean water, clean food, freedom from all kinds of insect pests—these are the sine qua non of successful chick raising. It would be impossible to estimate how many birds are lost to the poultry industry every year through the depredations of mites alone. Brooders and coops are clean when the hatch goes into them, and the novice, thinking they will remain clean, goes on his way unheeding. Sooner or later, unless insecticides are used, mites breed in corners, under unsuspected bits of filth, and the chicks begin to droop. Only the most rigorous measures will eliminate mites that have once taken possession of a brooder. The blood of the growing chick is meat and drink to them, and daily cleaning and painting with carbolineum or with kerosene and crude carbolic acid is necessary to get rid of them. When insecticides are used it should be in the morning, so that the fumes may evaporate before night.

Keep a Cow

Milk is so important a part of the diet of a growing chick that progressive poultrymen advocate the keeping of a cow as a necessity. Not only does milk contain the protein that is needed to build up the tissues of the chick's body, and the vitamins which all young life requires, but sour milk is distinctly medicinal in character. It prevents white diarrhoea and is the only known cure for coccidiosis. Various milk preparations are recommended when fresh milk cannot be had, but there is nothing quite so good as whole milk, either sour or sweet. Every poultryman who can possibly manage it should have an alfalfa field large enough to feed a cow as well as to provide greens for his flock, and should keep milk before his growing chicks. Milk will not lessen the depredations of mites and lice, but it will largely do away with digestive disturbances and insure rapid growth.

Poultry Queries

Conducted by Jean A. Koethen

Hens are Loafing

My 250 hens and pullets gained up to 140 eggs per day during the latter part of December and the first half of January, but now average only 90 eggs per day. Egg mash is before them all day, and mixture of two parts rolled barley, one part cracked corn, one part milo in evening for scratch, with wheat in litter when lights go on at 4 a. m. Hens have free range and plenty of green.—Subscriber.

Perhaps you are turning on the lights too early. Their excessive use is said to throw hens into a spring moult. You do not say how much grain you feed. If it is too large a proportion of the ration the hens will put their feed into fat rather than into eggs. A quart of grain daily to 16 hens is now considered sufficient.

Culling Pullets

What months are best for culling out pullets?—Subscriber, Oakdale.

Most poultrymen cull every month in the year, but culling for early molting is done in June, July and August, while culling according to color of shanks, beak and vent is done in late spring and early fall. Birds that show bright yellow in shanks and beak in May have not laid heavily during the winter, and those that show bright yellow in September and October have already completed the molt. Pullets that go broody or stop laying for any other reason before July are removed from the flock at once.

Grain in Hoppers

What is your opinion of feeding gain in hoppers? From my own observation a hen will eat no more grain than just what she wants. If feeding in hoppers is all right for a small flock would it be just as good for a large one?—Subscriber, Oakdale.

(Continued on Page 167.)

Forty-three years ago Alexander Graham Bell, the inventor of the telephone, wrote this inspired forecast: "It is conceivable that cables of telephone wires could be laid underground or suspended overhead, communicating by branch wires with private dwellings, country houses, shops, manufacturers, etc., and a man in one part of the country may communicate by word of mouth with another in a distant place." At the right, an old print of Bell lecturing on telephony, 1877.

Foresight

More than forty years ago, when the telephone was still in its experimental stage, with but a few wires strung around Boston, the men back of the undertaking foresaw a universal system of communication that would have its influence upon all phases of our social and commercial life.

They had a plan of organization capable of expansion to meet the growth they foresaw; and their wisdom is borne out by the fact that that plan which they established when telephones were numbered by dozens is efficient now when telephones are numbered by millions.

This foresight has advanced the scientific development of the art of telephony to meet the multiplied public requirements. It has provided for funds essential to the construction of plant; for the purchase of the best materials on the most advantageous terms; for the training of employees to insure skilled operators; for the extension of service in anticipation of growth, with the purpose that no need which can be foreseen and met will find the Bell System unprepared.

The foresight of the early pioneers has been developed into a science during the years which have elapsed, so that the planning of future operations has become a function of the Bell System. This is why the people of the United States have the most efficient and most economical telephone service in the world.

MORE WEIGHT, QUALITY, PROFITS

That is What a SHORTHORN Bull Will Do!

Cattle profits are largely measured by low production costs. A good pure bred Shorthorn bull will increase the weight of your steers at any given age; will improve their quality and increase your profits. The scrub bull won't do in 1922!

THE ANNUAL SPRING SALE

California Shorthorn Breeders' Association

University Farm, Davis, February 22

60 BULLS

In selecting the 60 bulls the committee has kept in mind the type of bull most sought after by range operators. They are outstanding in size, quality, constitution, fleshing and bone. Furthermore, a lot of them will be sold in lots of five to a full carload, thus making it possible for buyers to fill their needs at their own price. A few bulls are included that can fill the bill as herd headers. Some are straight Scotch, others are Scotch topped.

Remember: The Better the Bull the Better the Steers

20—CHOICE FEMALES—20

The farmer or breeder in search of foundation females will find among the 20 head cows and heifers of correct breeding and type. Why not start a small herd now?

The consignments have been drawn from the best herds in California. Every animal guaranteed a breeder.

Bulls in Carload Lots

Hereford Facts:

405,582 Reg. Herefords in U. S.

159,126 Reg. Hereford bulls in service.

19,264 more Hereford bulls in service in U. S. than registered cattle of any beef breed.

25 states have more registered Herefords than other beef breeds.

Herefords won every prize in Short Fed classes, 1920-1921 Internationals.

Grand champion steer over all breeds, Denver, 1922.

This sale affords the first opportunity in California for buyers of range bulls to buy them in groups suitable for the carload buyer.

There will also be at least 20 bulls sold individually, to take care of the buyer who wants only one or a few head.

There will also be about 25 cows and heifers of good breeding for the man who wants to increase his she stuff.

Every Animal Registered, Transferred Free of Charge, Guaranteed a Breeder, and Tuberculin Tested

These choice registered Herefords are consigned by fifteen leading Pacific Coast breeders under auspices of

Pacific Coast Hereford Cattle Breeders Assn.

Belgian hares, 12@15; old, 8.

LIVESTOCK

Los Angeles, Feb. 7.—Weighed and delivered off cars without food or water: Hogs (hard grain fed), 125 to 175 lbs., 8.75; 175 to 225 lbs., 9.25.

Cattle (on foot, gross weight): Steers, good, 7.00; medium, 6.00; cows, good, 5.50; medium, 5.00; calves, 125 to 150 lbs., 8.50; 150 to 225 lbs., 7.50.

Sheep: Ewes, 4.00@4.50; lambs, 8.50 @9.00.

POTATOES AND ONIONS

These are the actual prices obtained between 7 and 8 o'clock, February 7, by wholesalers in their sales to retailers, peddlers, hotels, restaurants, cafeterias, etc. Terms: Cash on walk. There may be slight fluctuations during the day's trading.

Potatoes: Movement moderate, market firm. Lugs, 90@1.00. Stocktons: Burbanks, per cwt., best, mostly 2.35@2.50, few 2.75@2.85; poorer, 2.00@2.25. Idahos: Russets, best, mostly 2.50@2.75; bakers, 3.00@3.50. Sweet Potatoes: Movement moderate, market weak. Locals, No. 1, best, per lug, 1.00@1.10; poorer, 60@90 per lug. Arkansas: Nancy Halls, per bu., 2.25@2.50; per lb., 5.

Onions: Demand moderate, market strong. Stocktons: Per cwt., White Globes, best, mostly 9.00; browns best mostly, 7.00@7.50; lugs, whites, best, 2.75 @3.00; browns, 2.10@2.25.

VEGETABLES

These are the actual prices obtained between 7 and 8 o'clock, February 7, by wholesalers in their sales to retailers, peddlers, hotels, restaurants, cafeterias, etc. Terms: Cash on the walk.

The supply of vegetables on the local produce market has been limited by the recent freeze and several commodities were scarce and higher in price yesterday. Cauliflower averaged 50 cents a crate higher than Monday and sold from 2.75 to 3 a field crate. Celery was also high, the best local stock selling from 6.25 to 6.50 per crate. Cabbage prices were unchanged and much poor stock was offered. Lettuce was firm, but a good deal of the offerings were only of poor quality.

Artichokes: Doz., 1.75@2.00. Brussels sprouts: Mostly 20 per lb. Sacked vegetables: Beets, 2.75; carrots, 2.75; turnips, mostly 1.00@1.50; parsnips, 1.75@2.00.

Bunched vegetables: Per doz. bunches: Turnips, 35@40; carrots, 50@65; beets, 50 @65; radishes, 25; parsley, 20; spinach, wide range in quality, 35@45.

Cabbage: Market stronger. Per field crate, mostly 1.25@1.50; few best, 2.00; poorer, 1.00.

Cauliflower: Market stronger. Wide range in quality. Per field crate, mostly best, 2.50@2.75; poorer, low as 1.50.

Celery: Market stronger. Locals: Best, 5.50@6.00; poorer, 4.00.

Cucumbers: Market steady. Hothouse, mostly 1.00@2.50.

Celery: Market firm. Locals: Best, 6.25@6.50; poorer, 5.00@5.50.

Chicory: 80@1.00 crate.

Lettuce: Demand moderate, market steady. Locals, quality poor; field crate, 1.50@1.75; shipping crates, 75@1.00. Imperial Valley, best, 1.10 per dozen heads; 3.00@3.25 per field run shipping crates; 3.75@4.00 packed crates.

Parsnips: 75@1.00.

Onions: Green, 15@20 bunch.

Peppers: Mexican chili, mostly 15; Bell, fancy, 35@40.

Rhubarb: Box, 1.75@2.00.

Tomatoes: Market steady. Mex., lug, repacked, 4.00@4.50; original, 3.75 per lug; per crate, 3.50@3.75.

CITRUS FRUITS

Grapefruit: Movement slow, market dull. Californias: Northern: Packed box, 3.00@3.25; market pack, 2.75@3.00; small, 2.25@2.50. Imperial Valley, 4.00@5.00. Arizonas: Seedless, 4.00@5.00, according to size and quality.

Lemons: Demand and movement slow. Market dull. Locals: Loose boxes, mostly 2.25@2.50.

Oranges: Demand limited, market steady. Navels, special brands, 126s-176s, mostly 5.00@5.50; 200s-216s, 4.50@5.00; market pack, 2.40@4.00, according to size and quality; culls, 1.00@2.00 per field box.

Tangerines: Demand and movement light, market dull; mostly 6@8; poorer, 5@6 lb.

HAY

Alfalfa Growers of California report: There were 1,600 tons of grain and alfalfa hay received on the Los Angeles tracks the week ending February 4, with 360 tons held over.

There were 2,250 tons of grain and alfalfa hay received on the Los Angeles tracks the week ending January 28, with 480 tons held over.

Prevailing prices last week, delivered in the vicinity of Los Angeles:

No. 1 dairy alfalfa.....25.00

THE NEW, PERFECTED Staude Mak-A-Tractor

Clamped to an Ordinary Automobile
Anybody Can Attach and Operate It

MILLIONS of dollars worth of these machines have been in successful use for years on thousands of farms, doing regular farm work—plowing, dragging, discing, mowing, reaping, cultivating orchards, etc. Also used successfully by road builders for pulling road drags, gravel wagons, graders, etc. Used by many golf clubs and city parks for pulling mowers cutting 12-foot swath, hauling dirt, ditching, etc. Converts any used auto into a profit-earning machine. Cheapest power on earth. Has more uses than any other tractor. Won all important events at Famous International Tractor Trials. Every farmer or trucker needs this simple machine. Does the average work of from three to six horses, depending on size and condition of auto.

Write for Special 6 Months' Trial Offer

DON'T BUY NOW. TRY IT FIRST. Among the many machines sold last year, we put out 100 machines under this extraordinary offer, and after six months' actual trial on his own work, every user bought the trial machine and paid us in full, proving complete satisfaction. To prove our confidence in this machine, we are going to extend this wonderful offer to 2000 users this year. All we ask is that you apply the Golden Rule. Pay us for this machine after six months' actual use, if you like it; or send it back, and owe us nothing. You are the only judge.

Citrus Markets

Shipments

Shipment of citrus fruits to date since November 1, 1921. Southern California: Oranges, 4,822 cars; lemons, 1,625; total 6,447. To same date last season: Oranges, 5,430; lemons, 1,503; total, 6,933. From Central California to date this season: Oranges, 4,186; lemons, 80; total, 4,266. To same date last season: Oranges, 3,987; lemons, 75; total, 4,062. From Northern California to date this season: Oranges, 368; lemons, 7; total, 375. To same date last season: Oranges, 301; lemons, 3; total, 304.

POULTRY QUERIES

(Continued from Page 165.)

The only difficulty about feeding grain in hoppers is that you cannot control the proportion of grain to mash. Most hens prefer grain to mash, and if they have access to all the grain they want they will eat it to the

exclusion of mash. If you can keep your grain in hoppers and still compel them to eat as much mash as grain there is no objection to hoppers.

Cutting Wing Joint

Would you advise cutting off the first joint of one wing of Leghorn chicks to prevent their flying over

fences? If so, would it not be well to put iodine on the wound to stop bleeding and prevent infection?—Subscriber, Santa Maria.

Many poultrymen adopt this plan. There is very little bleeding and very little danger of infection, but there would be no harm in putting on iodine.

Sir Prince Aaggie Mead

CONSIDER THE TREMENDOUS PRODUCTION AND DEMONSTRATED ABILITY TO TRANSMIT PRODUCTION ON BOTH SIDES OF HIS PEOL-GREE.

His sire, King Aaggie Mead, is a son of the 1,000 lb. foundation cow Aaggie Acme of Riverside, who produced the 1,331 lb. world's strictly official record cow, Aaggie Acme of Riverside, who in turn produced California's only 1,000 lb. junior 2 year old, Miss Aaggie Acme Burke.

His dam, Miss Valley Mead De Kol Walker, with two records above 1,000 lbs. butter in one year, and now making a yearly record that promises to exceed her previous best record of 1,113 lbs., is a daughter of the 1,011 lb. 4 year old De Kol of Valley Mead 2d, who in turn is out of the foundation cow, De Kol of Valley Mead.

HE IS BEING GIVEN HEAVY SERVICE IN BOTH OUR HERDS. KEEP ONE OF HIS SONS IN MIND FOR YOUR HERO SIRE.

FOR SALE—75,000 CUTTINGS

Rooted and Not Rooted, of a Wonderful Resistant Grape Vine which will bear without being grafted

The "MASSON SALVATOR" Grape Vine

The only satisfactory, absolutely resistant direct bearer grape vine now obtainable in America. It is a Hybrid, two-thirds Rupestris, one-third Teinturier—a prolific bearer, tried many years under all soils and climatic conditions. It readily takes root from cuttings and produces a juice of a color intensity far superior to the Alicante Bouchet.

Sign of Prosperity"**

*Increase Your Profits 25%

LOOK no further! "National" engineers have mastered the silo problem for every user. "National" big scale production brings silo prices down to where no dairyman or stockman can afford to do without proper silo equipment.

In the three National Silos shown here—the Cyclone, the Ironclad and the Atlas—we have produced a range of silos from the cheapest that's good to the very finest made. It depends upon your particular conditions which of these you want. If you have dairy cattle, beef cattle, hogs or

sheep, there is a National Silo that will earn money for you—that will pay you a return of 25% to 100% a year on your investment, that will increase your milk yield 25%, that will bring your beef cattle, hogs or sheep into condition quicker, and above all, will reduce your feed bill and enable you to make bigger profits.

*United States agricultural reports show that any dairyman who can break even without a silo can show a profit of 25% a year with the proper silo equipment.

We have written a book called "Silos and Silage" which gives you more practical, down to earth information about silos and the feeding of silage than any book of similar size ever published. We will send you a copy of this book free. Just write for it—or mail the coupon.

A few counties still open for National Silo representatives.
If interested, write.

Hegari, One of the Newer Grain Sorghums

Arizona Leads in per acre production of grain sorghums. The 1921 crop was more than double that of 1920. Milo is the principal grain sorghum raised in Arizona, but Hegari has become a close rival within the past two years. Hegari yields practically the same as Milo. The grain is said to be fully as good and the forage is relished more by animals and is more valuable for silage. The photograph shows an Arizona field of Hegari.

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

If among the more than 40,000 Cultivator's weekly circulation any fall to find any article they desire to purchase advertised in the Cultivator's columns, a special request is extended to you to let your wants be known to the California Cultivator and we will place you in touch with proper parties.

EDITORIALETTES

Few crops have increased in popularity in Arizona and California more rapidly than the grain sorghum. We began with "Gyp" and have come along down the line with Milo, Feterita and others and now have one comparatively new grain, Hegari, which is illustrated in the photograph on this week's cover. It looks good and has proven wonderfully popular in Arizona.

And Yolo County has now come with still another sorghum. This grain will be fully described and illustrated in the California Cultivator of next week in an article by Prof. G. W. Hendry on White Yolo, a New Grain Sorghum. The illustrations will also give prominence to headers and threshers which have been tested out on sorghum grains at the university farm at Davis.

A Hemet subscriber writes: "I notice in last week's Cultivator you reported 3.20 inches for last week's storm while as a matter of fact it was an even four inches, while this

week's storm has ceased that by 1.70, making for the season 22.28." The trouble with our former report was that the weather won't stay put this year and as we go to press on Tuesday and Wednesday of each week our weather reports get rather stale before our readers get possession of them. The fact of the matter is all of California has had a delightfully wet season and we are surely promised a wonderful crop year.

One thing the abundant rains are doing is the raising of the water table. In areas which have been pumped extensively wells have shown material effect from the drouth of recent years. Old levels are being restored. Irrigators will save many a gallon of oil because of the lessened lift.

The National Orange Show is on. As always has been the case it is better than ever. The citrus people are continually growing, the citrus orchards are continually growing and the National Orange Show must hit the pace.

A noted English lady, Miss Christabel Pankhurst, now visiting in California, is apparently a keen observer and has decided why California is as great a state as it is. At least she has made two observations which are real reasons of greatness. First, the state is agriculturally strong. The lady had hardly reached the state before she learned that some half dozen of the greatest crop producing counties of the United States were within the boundaries of California. "Again," she said, "you Californians must be sure and keep your natural beauty, likewise your created beauty. They are wonderful and are really assets." We appreciate the lady's appreciation. We believe she is honest and also that she is entirely correct in her estimate of our two greatest assets. She did not refer to our wonderful climate, this doubtless because of short time residence. She is booked for a few weeks' residence at least in Los Angeles County. Before she leaves she will add climate to California's great assets.

The Senate has overwhelmingly approved the Capper-Volstead Act which permits freer cooperation on the part of producers. A few minor amendments were made but it is thought it will go through the conference with slight opposition.

Stockman's Week at the university farm at Davis begins Monday morning. Nearly everything of interest to livestock men will be up for discussion, will be on the boards for five full days.

We are assured that this year's orange show will have more of practical commercial lessons than any of its predecessors. There will be exhibited implements, frost fighting equipment, sprays and methods of application and fumigation appliances. Then there will be commercially packed fruit and methods of boxing and shipping exemplified. For the housewife there may be found for inspection scores, we may almost say hundreds, of jellies, marmalades, confections, oils, extracts, cured peel, home cured citron, in fact, almost everything that can be made from citrus fruits.

Some of the citrus orchards will find their earning capacity materially lessened by the "unpleasantness" of January 19, but few of the trees are injured sufficiently to lower the next

year's output. This year's crop may be cut down ten per cent, or possibly 50 per cent, by the low temperatures. The rich ground and the abundant water are still available, especially where trees are not too large. With beans or onions, chili peppers, potatoes, cabbage, strawberries, garlic, or even "punnings," there are possibilities of a little profit and additions to the home table. With liberal use of water and possibly a little fertilizer good crops are possible.

Every dog has his day, and there have also been orange days, apple days, raisin days, onion days, bean days, pear days and other days innumerable. Now the cow has her day, or rather, it is to be called dairy day and is featured by the boosters of Riverside County.

Riverside is getting all dressed up and is making a place for all Berkshire people to go for the entire week of February 27. Geo. Stingle of El Monte is receiving entries for the American Berkshire Congress and Show and he promises a most wonderful showing of real hogs.

Lima bean growers are donning their fighting clothes. "New members and lots of them" is the slogan. The new '22 contract is generally acceptable. The method of campaigning is "every neighbor get a neighbor," and they are getting them. Cooperation is the only salvation of the bean industry and unless the bean growers see it they're gone.

Iowa is agitating for a greater number of cooperative fire insurance associations, and when more of them are organized then let there be a large state federation. Here again is where California leads. A greater number of California counties are now supplied with cooperative insurance associations. They are doing good work and saving to the farmers a bunch of money.

CHANGE OF ADDRESS

As a rule at this season of the year, or until after April 1, more subscribers change addresses than during any other period. To insure receiving your copy of the California Cultivator promptly it is a good plan to write the publishers, addressing California Cultivator, 317 Central Ave., Los Angeles, a week or two weeks in advance of your moving, giving old as well as new address, name, route, box number, post office, etc., and make yourself known to postmaster and carrier at your new address. This will assist everybody and usually insure delivery of your paper without missing any numbers.

DR. WOODBRIDGE

S. M. Woodbridge, a chemist of many years experience in California, at one time at the head of the Agricultural Chemical Works, and prior to his coming to California, assistant to Harvey E. Wiley in the United States department of agriculture, died in San Bernardino last Monday.

Dr. Woodbridge was widely known amongst fruit growers, was frequent attendant at conventions and had thorough knowledge of chemistry.

SUSTAIN THE QUARANTINE

The need of greater effort and greater efficiency in federal and state quarantine was never apparent as now. Renewed activity in American shipping, increased interchange of fruits

and plants and increase in travel make the need for a greater and more efficient inspection force at every port.

California has done her best and as far as possible the federal forces have cooperated. However, the information as to the menace and sentiment favorable to thorough enforcement throughout the country over has not been equal to that in California and the demand for economy has been greater. Inspection at Atlantic ports has been far from as effective as here on the Pacific coast. Even here we need a greater number of men on the job. The Mediterranean fruit fly is only one menace but it is ever present and the preventing of its entrance will be worth many times the cost of our quarantine service for all time to come.

DISARM

We are still toting guns and we fear the time will not come within the lifetime of those of us who are now subscribers of the California Cultivator when peace on earth and good will to men shall be so complete that we may beat up our guns into useful implements. But ultimately it may. In any case, it is the general belief that in this year of our Lord, 1922, one great step has been taken toward giving peace a "fighting" chance.

Nearly every nation on earth is uniting in giving the United States great credit for calling the peace conference. In answer to the invitation came Great Britain, Japan, France, Italy, China, Holland, Belgium and Portugal. Nearly three months were required for the conference to finish its work, but its work resulted in several international treaties.

One was between the United States, Great Britain, France and Japan, in which it was agreed that any differences over affairs in the Pacific should be negotiated.

Another was between the United States, Great Britain, France, Italy and Japan in an agreement to a naval holiday which shall last for 15 years and as a first step to this agreement all capital ships uncompleted are to be destroyed and in addition a reduction of naval equipment now existing.

Between the United States, Great Britain, France, Italy and Japan to subject submarine and poison gas use to established law of nations.

Fourth, between the United States, Great Britain, France, Italy, Netherlands, Belgium, Portugal, Japan and China, agreement to the increase in the tariff that China may levy on imports.

Fifth, between the United States, Great Britain, France, Italy, Belgium, Netherlands, Portugal, Japan and China, agreement as to definitions of "open door" into China and providing for a complete Chinese sovereignty over all of the empire.

Finally, a treaty between China and Japan as to withdrawal of Japan from Shantung. In closing the conference President Harding said:

"I will say with every confidence, that the faith plighted here today, kept in national honor, will mark the beginning of a new and better epoch in human progress.

"In the revealing light of the public opinion of the world, without surrender of sovereignty, without impaired nationality or offended national pride, a solution has been found in unanimity and today's adjournment is marked by rejoicing in the things accomplished. If the world has hungered for new assurance it may feast at the banquet which the conference has spread."

One Dollar Yearly

MELAXUMA is a disease characterized by black cankers and exudation of "black sap" on the large limbs and trunks of walnut trees. The disease first attracted attention in Santa Barbara County about ten years ago but is now somewhat prevalent in certain orchards in Los Angeles and Orange Counties.

Investigations by the writer begun in 1913 have shown that the disease is infectious, that the casual agent is a fungus and that the cankers may be checked by cutting out and disinfecting the wounds. In order to have a definite name for this disease the term melaxuma, derived from two Greek words meaning "black juice," was chosen and is now in fairly common use.

Melaxuma of the Walnut

By H. S. Fawcett, Before Walnut Growers Institute

Melaxuma should not be confused with other effects producing a black sappy exudation frequently following sunburning, frost injuries, heart rot, etc. Such black sap may be quite independent of Melaxuma although the sappy ooze itself is similar to that in connection with the latter disease.

Melaxuma results in definite areas of killed bark not only on the trunk and large limbs, but also in severe cases on the smaller branches. Young trees appear to be rarely affected. The cankers found on the larger limbs

are usually sunken areas from a few inches to even a foot or more in length. Both the bark and the wood underneath become black, and during the actively growing period of the tree a considerable amount of the black sap will form just underneath the bark. As the disease progresses the bark shrinks, cracks, and this black sap runs down and stains the limbs below the cankers. The disease may start on a small sized twig and after killing it spread in an oval area to the bark of the branch bearing this twig.

In severe attacks smaller twigs are rapidly girdled, and the whole branch beyond the affected place suddenly withers and the dead leaves remain attached to the branch.

The most common place for the cankers to start is in injuries made by carelessness in cultivating the orchard or at the crotches where the first large branches start out. In the development of these cankers after the bark first cracks and the black sap oozes out, there is a tendency for new tissue to form around the edges and retard the further spread of the diseased area. A few of the cankers may heal up entirely, but this is rare. A canker will often seem to be healing up nicely in the fall and winter, but will start again on one side when the active

(Continued on Page 178.)

Commission on Agricultural Education

By R. N. Wilson

ONE of the most important agricultural developments during the current year will be the report of the commission on agricultural education, since it is expected that much of the future trend of agricultural education in California will be guided by this report.

What are the goals of agricultural education?

Is the present college of agriculture and experiment station meeting our needs?

Are shortcomings to be met by changes in the existing institutions or by the creation of new ones?

Should junior colleges of agriculture be centralized in two or three places or scattered throughout the state?

Should farm school work or sub-collegiate instruction be taught at the same institution in which college work is taught?

Should experiment station work be centralized in a few points or scattered throughout the state?

Should the college of agriculture and experiment station be entirely separated from the University of California?

These and a maze of equally important related questions must be considered by the commission on agricultural education. Who are the members of this commission and what are their qualifications for such an important work?

The seven members were born in six different states, California being the only state claiming two. Practically all have worked as farm hands and six now own farms. Each received his advanced education in a different institution. Some have been teachers, investigators, or have dealt with organizations, finance and administration of agricultural institutions. Practically all of the large groups of agriculture are represented by farmer members, including horticulture, livestock and general farming, while others have dealt with land development, land settlement, cooperative marketing and rural organization.

The membership includes two presidents and one ex-president of county farm bureaus, and several well known books have been written by members. Civil and mining engineering and newspaper work are among other professions followed. One is immediately impressed by the vast area over which these men have operated in one way or another, including many of our states, Alaska, Mexico and Australia. The broad qualifications of these men and their records of achievements throughout the state and nation lend confidence to any report which they may make.

The commission is now gathering data from colleges throughout the United States, eight or ten of which will be visited during April and May. Following the eastern trip hearings will be held at several points in the state. According to the bill authorizing this work a report must be submitted to the governor before the next regular legislative session next January.

Fortunately we are never satisfied with everything on this earth. Amongst other things Californians are dissatisfied with are our educational institutions. We want them better, always better. Some months ago this want generated a spasm of kicking. It ultimately resulted in the appointing of the commission of agricultural education which will investigate in this and other states and later report as to the needs of California's agricultural college.

The personnel of the commission appointed by Gov. Stephens: Upper left, James J. Hollister, Gaviota; next below, Sheridan W. Baker, Santa Rosa; bottom left, Samuel G. Mortland, Fresno; upper right, Dr. Elwood Mead, Berkeley; next below, Wm. S. Guilford, Butte City; bottom, G. Harold Powell, Los Angeles; center bottom, R. G. Sproul, Berkeley.

Agricultural News Notes of the Pacific Coast

Northern California

Retail milk prices in San Francisco have been reduced 1 cent.

An association has been formed to purchase lands at Hay Fork for a permanent Trinity County fair.

The Rice Growers Association last week made sale of 20,000 bags of rice at \$2.65 to \$2.67 on No. 1 paddy.

The Sebastopol Apple Growers' Union is planning to build a packing house at Garbro Station in time to handle the 1922 crop.

A 50,000 sack shipment of rice was sent from Oakland to the East and the Orient last week, together with 100 carloads of raisins.

Rice and rice products are included in the ten per cent reduction in transcontinental freight rates on farm products, in effect the first of the year.

The farm bureau at Corning, in Tehama County, is organizing a cooperative marketing movement of the fruit and vegetable growers of the district.

The Federated Chambers of Commerce of Alameda County has appointed committees to organize every section in the fight against county division.

The Shasta County Fair Association has been incorporated. It will plan for two fairs, one in Anderson, the other, the Intermountain Fair, at McArthur.

The plant of the Ocean Shore Canning Company at Half Moon Bay is being overhauled and new machinery installed to handle spinach, artichokes, peas and brussels sprouts.

Local farm bureau meetings will be held in Shasta County at Redding, February 18; Cottonwood, 20; Palo Cedro, 22; Hat Creek, 24; Fall River Mills, 25; Mountain, 26; Millville, 28.

Florists of San Francisco have a cooperative marketing organization composed of growers, nurserymen and retailers. San Francisco Business says that last year the floral crop brought in \$7,000,000.

The Morris cemetery removal act has been held constitutional. This act was passed by the last legislature and authorizes removal of cemeteries closed for over 20 years in cities of more than 100,000 population.

The chamber of commerce of Willows, Glenn County, will plant 500 black walnuts along the west side of Sacramento Valley state highway. South of Willows 50 trees of different kinds will be planted to demonstrate alkali resistant qualities.

Cherry growers have formed a state association. The following directors by counties were named: Sonoma, L. A. Frei, F. W. Maddocks; Napa, L. F. Coombs; San Joaquin, A. B. Haslach, C. Searie; Alameda, C. Long, Jr. The new officers are F. W. Maddocks, president; A. B. Haslach, vice-president, and C. Long, Jr., secretary.

Quarantine Officer Fleury has recently returned to Sacramento from a trip to Lake County, where, in company with State Quarantine Guardian Sydney J. Stokes, he called upon a number of the postmasters of that county with the view of getting better cooperation from them in the matter of reporting and forwarding for inspection parcel post shipments of plants and plant products.

Central California

Olive growers of Kern County have formed a marketing association.

The Clovis, Fresno County, farm bureau center started recently with 200 members.

Many Turlock, Stanislaus County, farmers are considering putting in cucumbers.

It is rumored that another fruit packing plant will be located at Exeter, Tulare County.

A new cow testing association began its activities in Stanislaus County, February 1.

Petitions are being circulated for the formation of the Kern River water storage district.

The town of Sultana in Tulare County has nine fruit packing houses, one raisin plant and one fig preserving plant.

An industrial show and products exposition is being arranged at Fresno in connection with the celebration of Raisin Day.

The Kern County union high school has a brand new agricultural building. Ninety boys are enrolled in the agricultural classes.

The Stanislaus County farm bureau has outlined a big dairy program for 1922, the chief feature being the testing of 2,000 cows.

Fresno County Historical Society is planning to celebrate next April the 50th anniversary of the coming of the railroad to Central California.

Thousands of lambs have been frozen on the mountain ranges and many sheep starved because they were unable to reach feed through the blanket of snow.

All directors of the Tulare Cooperative Poultry Association were reelected at the annual meeting held January 30. One hundred members were present at the meeting.

At the last meeting of the Delhi poultry council it elected E. A. Nelson, president; William Girdwood, vice-president; Geo. W. Ferguson, secretary; S. G. Warner, treasurer.

The members of the farm bureau exchange of the Stanislaus and Merced Counties north of the Merced River will dissolve the exchange, paying up liabilities amounting to \$35 per member.

Farm bureau meetings in Kern County at Mountain View, 20; Pond, 22; Inyokern, 23; Rosedale, 24; Shafter, March 1; Arvin, 3; directors, Bakersfield, 4.

February 22 is Roadside Cleanup Day in Kings County. The plan is that on that day property owners will attack their premises and rid them of all possible unsightly objects, weeds will be plowed under along roadsides. This will probably be made an annual event.

West Side irrigation district, in process of formation, comprises approximately half a million acres in Fresno and adjacent counties. It is proposed to take over the canal systems of Miller & Lux, the San Joaquin and Kings River, San Luis, Gravelly Ford and Firebaugh canal companies, claiming nearly 10,000 second feet of water, and to acquire storage rights in 538,000 acre feet more.

Southern California

The Orange Show is on at San Bernardino. Closing day is February 27.

Orange County bee keepers expect at least a 60 ton honey yield this year.

Eisimore, San Diego County, has a rainfall this season well up to the 20 inch mark.

The Santa Ana chamber of commerce is laying plans for a walnut show next fall.

State highway engineers have completed survey of the Blythe-Mecca road through the Chuckawalla Valley.

There is talk in Oxnard of securing a creamery. Farm bureau members are seriously considering the proposition.

A carload of buffalos for the Hearst ranch near San Simeon, San Luis Obispo County, has just arrived from Idaho.

Palo Verde Valley of Riverside County closes the cotton ginning season with a record of nearly 10,000 bales.

The Anaheim Citrus Association is arranging to purchase land on which tents may be erected to house pickers during the coming season.

The Irvine Walnut Association of Orange County shipped 784 tons of nuts the past season. A. J. McFadden has been reelected president of the association.

An exhibit of Imperial Valley grapefruit will be made at the National Orange Show at San Bernardino by the associated chambers of commerce of the valley.

At the annual meeting of the Garden Grove Walnut Association directors elected are: W. W. Dugan, Henry Carner, C. C. Vogle, P. D. Brady and Ed Farnsworth.

To conduct an extensive survey of flood, irrigation and reclamation conditions in Imperial Valley the Colorado River Commission will meet in El Centro, March 20.

The annual citrus institute will be held at San Bernardino during the National Orange Show. Date of the institute, February 21. Sessions will be held in Elks' Hall.

May 23-30 have been chosen as the days to celebrate the Valencia Show at Anaheim. Negotiations are being carried on with the National Orange Show Association for use of the big tents.

Formation of three pools of fruit, instead of two as formerly, has been determined on by the Anaheim Citrus Association. The year's crop will be divided among the three pools on a 40-40-20 ratio.

The Imperial Valley Press and the El Centro Progress have been merged under the name of El Centro Press. The new publishers are Harry W. Hammond, Ross L. Hammond and M. J. Westerfield of Riverside.

Two carloads of purebred Berkshire hogs, one from the East and the other from Northern California, will be shown at the Berkshire Congress to be held at the Southern California fair grounds at Riverside, February 27 and 28.

A series of farm management schools will be held in Los Angeles County during February. At these schools Prof. R. V. Wright, farm management specialist of the state college of agriculture, will demonstrate a simplified system of farm record keeping, together with proper making out of income tax returns.

The Coast and General

Cold weather in the Yuma section of Arizona damaged some alfalfa.

Six poultry demonstration farms will be conducted in Clackamas County, Oregon, this year.

A series of freezing nights has killed much of the young grass on ranges of the Salt River Valley of Arizona.

Tomato growers of Angelina County, Texas, have incorporated as a cooperative marketing association.

It is estimated that 200 carloads of citrus fruit will be shipped from the Lower Rio Grande Valley, Texas, this season.

An automobile show will be held in Mexico City April 16-23 under auspices of the American Chamber of Commerce of Mexico.

The Colorado River Commission, which held its first session in Washington, will again convene on March 15 at Phoenix, Arizona.

A three cent tariff on honey was asked by members of the American Honey Producers' League assembled last week at Salt Lake City.

In the Salt River Valley of Arizona little damage was done to garden truck or to the general crop of lettuce but late planted lettuce received a serious setback.

At the twenty-fifth annual convention of the American National Livestock Association which was closed at Colorado Springs January 14, Fred H. Bixby of Long Beach was chosen president.

The Yakima, Washington, Fruit Growers' Association held its annual meeting January 24, reelecting all officers. The association has 285 members and handles fruit from 3,451 acres of orchards.

The Arizona Cattle Growers' Association and the Arizona Wool Growers' Association are making tentative plans for a getting together of the two organizations to further their mutual interests.

The commercial crop of citrus fruit in Arizona was gathered before the freeze so that only fruit left on trees for local consumption was damaged and much of that is reported saved by smudging and irrigation.

A record in jackrabbit extermination is claimed by Oregon and United States biological survey agents working together in Fort Rock Valley. Three weeks' kill was estimated at 60,000. Poisoned rye was used.

Figures on cost of cow testing in associations are given out by the Oregon agricultural college. They show an average number of 107 herds doing official testing, and having an average of 491 cows on test. The cost per herd is \$10.44 per month, or \$2.27 per cow net to owner.

The U. S. weather bureau reports from Arizona and western New Mexico ranges: "Although morning temperatures in the northern portion of the state have been close to zero and on a number of mornings several degrees below, stock have come through the unusually cold spell remarkably well."

Temperatures averaging six degrees below normal have been general over the southern portion of Arizona during the last days of January constituting a period of cold weather seldom equalled in the last 25 years.

At the recent annual meeting in Portland of the Oregon state chamber of commerce the importance of settlement of lands in the state was emphasized by the statement that there are only eight persons to the square mile in Oregon.

Specializing in Chicks

By Jean A. Koethen

WHEN Mr. and Mrs. P. F. Fuller purchased a half finished home on Lankershim Boulevard and with it five acres of sandy soil and a poultry plant which its original owner had commenced on ample lines but failed to complete, they were impelled by a vision of what poultry keeping might be made by suitable equipment and scientific management. That was three years ago. Today the beautiful cobblestone castle is one of the show places of the San Fernando Valley and the poultry plant with its four laying houses, comfortable brooder house and incubator house of 50,000 capacity nearing completion has proved to be a most profitable investment.

Housing for Health

The long laying houses accommodate 5,000 hens and are filled during the winter and spring, though the number is reduced somewhat by fall culling. They are built on the plan recommended by the poultry division of the University of California, with a smaller portion of the front open than is common in the south, but a larger air space inside. Instead of the usual height of 7 feet in front and 5 feet at the back these houses have a height of 9 feet in front and 7 at the back, which gives them 2 feet more of air space throughout. Six feet of the front is boarded up the entire length of the house, only the low door being left in each house for entrance and exit of the birds. Another door at the end admits the caretaker and supplies additional ventilation when it is required. The upper 3 feet of the front is covered with wire and with a swinging board awning which may be turned to admit sunshine to the farthest corner of the house or by the twist of a pulley rope exclude the sun entirely. Figure 1 shows one of the houses with the awnings in both positions. The closed front gives more protection from sun and wind and rain than is given by the ordinary open front, and the extra height makes the house comfortable in the hottest weather.

The houses are 20 feet wide by 144 feet in length, each of the nine sections being 20 by 16 and accommodating 125 hens, which makes the total capacity of the house about 1,200 birds.

Only Three Per Cent Loss

The care of the baby chicks is Mrs. Fuller's job, and she has done so well

that she plans to specialize in it. Realizing that the fall demand for pullets is far beyond the supply and that only a specialist who can raise to maturity nearly every chick hatched is able to fill this demand, she is building a new

must be credited to her love for the work and careful study of the chick and its needs. In November when I was there 1,000 lively chicks were quarreling over their feed and chasing each other up and down the sunny

Solid Comfort

Upper photo: Both indoors and out the hens on the Fuller Ranch have sunshine and shade. Lower photo: Warm as it is inside the brooder house, the chicks prefer the sunny, sheltered yard outside.

incubator house and enlarging her brooder equipment to meet it. Last year her losses between shell and laying house were not over three per cent, a remarkable record, and she is an enthusiast on the subject of chick rearing. Much of her success last year she ascribes to her new electric brooders which brood 500 chicks each with hardly any loss, but fully as much

floor of the brooder house, and she plans to rear 10,000 this winter.

The brooder heat is run at 90 degrees the first week, 80 degrees the second week, 70 degrees the third week, and the fourth week no heat at all is used. At the end of the sixth week the birds are transferred to the laying house and the brooder is ready for a new hatch.

The chicks are not fed at all for 48 hours, but have water, grit and charcoal before them. Their only feed the first week is very fine chick feed, fed first in trays, then in litter, after the system of the poultry division, of which Mr. Fuller is an earnest follower. On the tenth day they have dry mash set before them at 10 o'clock and 2 o'clock. The number of mash feedings is increased gradually to five a day, and after the fourth week the mash is left before the chicks all day. The change from chick grain to whole grain is made just as gradually.

Greens Are Bought

Some enterprising San Fernando Valley farmers are finding it profitable to sell their alfalfa in small quantities to the poultry people, and the poultry people find it cheaper and more convenient to buy their alfalfa in this way than to raise it themselves. The Fullers, like many others, buy their greens from a man who delivers fresh cut alfalfa three times a week at 30 cents per hundred pounds, and run it through the clover cutter as they need it. Kept in a cool place it remains fresh, and they are able to spend all their time in caring for their flock. Lettuce is bought from the truck farmers and is used with the cut alfalfa for the baby chicks.

Feeding for Eggs

A commercial dry mash is kept before the hens in hoppers, and mash and hard grain are fed in the proportion of 50 pounds mash and 50 pounds grain per hen per year. This insures an abundant supply of egg material. The grain mixture consists of 50 per cent wheat, 25 per cent barley and 25 per cent corn, which is sometimes cracked, but preferably at this season fed whole. A crumbly mash is given at noon and about the same time the troughs are filled with fresh cut alfalfa at which the hens nibble till time for the daily meal of hard grain which is given an hour before dusk.

Mr. and Mrs. Fuller are both enthusiastic over this, their first venture in commercial poultry keeping. "If anybody asks you whether there's money in chickens," declared Mr. Fuller, "tell them there's no question about it. A man can do better if he has capital enough for modern equipment and to keep things going till his pullets begin to lay, but the money is there, all right."

Crop Insurance--Is It Feasible?

By Theo. H. Price, Editor of Commerce and Finance,
Before Agricultural Conference, Washington

IN MY study of the agricultural problem that we are asked to consider I find myself asking whether a partial solution of it is not to be had by a resort to crop insurance. I submit the suggestion in the form of a question rather than as a recommendation because it is plain that much thought and investigation will be required to determine whether the hazards of agriculture are insurable. During the last two centuries the principle of insurance has been greatly extended in its application. The first "underwriters" were the merchants who wrote their names under an agreement to share the marine risks and losses to which the ships and cargoes of their fellow merchants were subject.

The business of fire insurance was next developed.

Then as the law of probabilities became better understood life insurance began to be written and the business

has grown until in the United States alone there are 40,000,000 policy holders in life insurance companies or associations whose resources are in excess of seven billion dollars. No one will deny the benefits of life insurance.

After life insurance came accident insurance and credit insurance, and now we can insure against losses caused by burglary, defalcation, rain, snow, hail and tornado, as well as against war, unemployment, old age, strikes and many other ills or accidents of life. It is said that at Lloyds in London policies have been written that called for the payment of a "total loss" to parents to whom twins were born, and just before the Disarmament Congress met in Washington the New York Times reported that 15 per cent was paid at Lloyds to

insure that the British West Indies would not be surrendered to the United States by or before December 31, 1922, in full or partial payment of Great Britain's debt to this country. Crop Failures Cause National Crises

From a very remarkable essay upon "War and Insurance," written by the late Professor Josiah Royce of Harvard, just after the outbreak of the world war in 1914, I quote the following passages:

"Experience shows that the insurance principle comes to be more and more used and useful in modern affairs. Not only does it serve the ends of individuals, or of special groups of individuals, but it tends more and more both to pervade and to transform our modern social order. It brings into new syntheses not merely pure and applied science, but private and pub-

lic interests, individual prudence, and a large regard for the general welfare, thrift and charity. It discourages recklessness and gambling. It contributes to the sense of stability. It quiets fears and encourages faithfulness.

"Floods, famines, pestilences, earthquakes and volcanoes may interfere in various fashions, with the economic as well as with the rest of the social life of the peoples thus afflicted. Apart from actual famines, the considerable failure of their crops may impair, for a season, the normal supplies of individual nations. Internal crises, social and political, may interrupt their healthy development in ways involving not only moral disasters, but heavy expenses. Such evils come upon various nations with irregularly recurrent, but also with widely different weight and seriousness. Only a vast and long continued collection and an exceedingly difficult

(Continued on Page 176.)

Walnut Investigations

By J. T. Barrett Before Walnut Institute

THE University of California agricultural experiment station has been more or less actively engaged with problems important to the walnut industry for a number of years. As early as 1905 a laboratory was established in Whittier primarily for conducting investigations on walnut blight. These early studies at first confined to the bacterial organism responsible for the blight disease, soon expanded to an investigation of the whole subject of walnut culture. In 1912 the results of the seven years' investigations and observations were published in Bulletin 231 of the agricultural experiment station by R. E. Smith and his assistants. After the reorganization of the experiment station work in the southern end of the state and the establish-

ment of the citrus experiment station at Riverside in 1913 a careful consideration was given to the best form of organization to adopt in order to meet the various and numerous problems confronting the various horticultural interests.

So far as the walnut investigations were concerned it was agreed that a man should be secured who should have as his main and special business the investigation of problems affecting the walnut industry. In 1915 Dr. L. D. Batchelor was appointed to fill this position and I need not tell you men that he has been on the job ever since. There are always more demands on an experiment station for aid in the solution of the growers' numerous problems than can be met by the funds available. This is especially true in such a state as Califor-

nia where the various agricultural industries, particularly horticulture, have reached the intensive and progressive stage that it has. Recognizing this fact and at the same time feeling the urgent need of having certain investigations put under way as soon as possible, the Walnut Growers Association proposed in 1917 that some plan of cooperation between the association and the University of California represented by the citrus experiment station be arranged. Such a plan was drawn up, approved, and soon put into execution. It is still in force and I am glad to say, in our opinion, it has proved to be a most satisfactory and productive arrangement. It is a good illustration of how a proper cooperative plan of investigation between the growers of a particular crop on the one hand and the research staff of an experiment station on the other hand can be so conducted as to give increased results. To be sure, if the state could furnish sufficient funds to conduct all of the various investigations which are de-

sired perhaps such arrangements would not be necessary, but that time has certainly not yet arrived. A representative of the field department of the California Walnut Growers Association, in the beginning W. E. Goodspeed and at present D. C. Wylie, has his headquarters at the citrus experiment station where he is more or less in constant touch with and under the supervision of the directing head of the various investigations. Several projects have been instituted under this plan and we feel confident that more progress has been made than could have been the case had the station not had this added assistance. Further, in the case of other investigations on walnut problems not specifically included under this cooperative arrangement we have had the most hearty cooperation and sympathy of the walnut growers of the state.

As to the results of the investigations to date, it must be apparent that at most only a brief resume can be given at this time. From time to time reports of progress have been presented by those directly in charge of the various projects and no doubt many of you are already fairly well informed as to the results.

The need of a careful study of the comparative value of present commercial varieties, as well as the possibility of finding in the many seedling groves new varieties of promise led to the formation of a project in 1915 on "A Study of New Walnut Varieties." While this project was well under way when the cooperative work was instituted, the work has been ably assisted by this arrangement. One of the very valuable results to date of this investigation has been the conclusion arrived at after a close study and observation, that the Ehrhardt variety should be recommended as a highly desirable one and perhaps second to none. The nut is of splendid quality, a good producer, and highly resistant to blight. Other promising new varieties are under observation and trial, particularly such as may be adapted to the interior sections such as the San Fernando and San Bernardino valleys. A trial of varieties will be established on northern black walnuts now growing at the citrus experiment station.

Another phase of this study has to do with blight resistance. This investigation is being carried on in cooperation with the division of plant pathology and already some data of value has been accumulated.

Desirous of determining whether fertilization of walnut groves is economically profitable as seemed to be indicated by reports on certain groves, a project was planned in 1917 on "Field Trials of Fertilizers and Green Manure Crops with Walnuts." Three trials were instituted as follows:

1. On young bearing trees located on the San Joaquin ranch, Tustin;
2. On trees over 20 years old, P. F. Cogswell ranch, El Monte;
3. On old trees, Limoneira ranch, Santa Paula.

The details of the plan of the trials and the fertilizers used have been previously reported, therefore only a statement as to apparent results to date seems appropriate here.

In trial 1, it is doubtful if there is any significant effect on the yield.

In trial 2, it is possible that the nitrogenous fertilizer has made a significant increase in yield but not commensurate with the cost.

In trial 3, the old trees, which had reached the stage when it seemed desirable to remove half of them, and production was not satisfactory, after a three year trial, it seems very probable that the nitrogenous fertilizers have made a significant increase in yield, but here again not commensurate with the cost.

In 1916 an investigation was planned and put into execution on "Sunburning and Winter-killing of Walnut Trees." This trouble largely confined to the inland sections almost annually causes a large amount of damage. It is especially severe on young trees from one to four years old.

The project was planned on the assumption that the sunburning or injury was primarily a climatic problem. The investigations have been conducted at Hemet where a carefully planned and thoroughly executed irrigation experiment has been under way for five years.

The results of these investigations

Levers set low when plow is at work

Subsoiler equipment replaces one disc. Controlled by power lift. Breaks up plow pan and forms deep bed of aerated mulch, thus saving irrigating water and increasing crop yields. Permits plowing and subsoiling in one operation with small tractor.

It Plows It Subsoils It Ridges for Irrigation

THREE orchard operations with one implement—a big saving on your equipment investment—that's one of the advantages you have when you use the

JOHN DEERE No. 26

The 3-in-1 Orchard Tractor Plow

Note the subsoiling and ridging equipment illustrated and described at the left.

Unusually low and narrow. The No. 26 is only twenty-six inches high when plowing six inches deep, and only thirty-seven inches wide—gets under low limbs and up close to row. Levers set low when plow is at work. Note illustration above.

Stiff, adjustable hitch—a great disc-plow improvement, permits offsetting plow to right or left of tractor for work close to row, and, being stiff, it tends to hold the plow in the furrow, when offset.

Floating rear end—loosening the set-screw collar on the rear axle permits rear of plow to rise over roots without carrying weight of rear wheel

—a great aid in preventing damage to large roots.

Compound power lift raises discs unusually high. Frame built over discs, providing unusual clearance. Discs and disc bearings same as on large John Deere disc plows. Simple construction, and every part strong and substantial. Just the right size for small tractors.

If you own a small tractor and plan to buy a disc plow, be sure to get acquainted with the No. 26. See it at your John Deere dealer's. Investigate its subsoiling and ridging attachments.

Write to us for free booklet illustrating and describing the John Deere No. 26.

John Deere Plow Co.
San Francisco, Cal.

Showing No. 26 preparing soil for proper irrigation with ridging equipment. Makes buying extra machine unnecessary. Power lift and guiding advantages are retained when the plow is used for ridging.

No. 45-A
Orchard Tractor
Plow

John Deere No. 45-A

Low and narrow like the No. 26—only twenty-six inches high when plowing six inches deep—only thirty-seven inches wide—levers set low when plowing—gets under the low limbs up close to row. Adjustable hitch permits offsetting for work close to row. Pulls unusually light—a real fuel-saver. Great strength—beams guaranteed not to bend or break. Compound power lift raises bottoms unusually high.

JOHN DEERE

THE TRADE MARK OF QUALITY MADE FAMOUS BY GOOD IMPLEMENTS

to date, we believe, warrant the conclusion that winter killing may be caused by one of two things: early fall frosts killing the immature twigs, or the effect of winter drouth. Dr. Batchelor reports that only trees on which the leaves were frost injured on the Hemet plots during the fall of 1919 were found to be killed back 12 to 36 inches from the tips of the past season's growth when examined during the spring of 1920.

It has been demonstrated that much injury can be avoided by eliminating the late fall irrigations of young trees, thus allowing the young growth to mature earlier.

Regarding the effect of winter drouth it can be stated that a study of all the available past weather records in conjunction with a recent field observation indicates that such injury may be expected not more frequently than two out of five years. It should be noted that the hazard is increased when late intercrops such as tomatoes, peppers or winter crops of barley are grown in the orchard. Winter irrigation has been demonstrated to be effective in reducing the die-back due to drouth but should be considered as a form of insurance rather than a constant necessity.

The most recently instituted project is walnut irrigation, harvesting, and curing in its relation to mouldy walnut kernels. The problem of the mouldy walnut has become of such importance that a special investigation as to its cause and especially the factors contributing to the infection of the nuts seemed advisable. The work was started in January, 1920. I need not delineate all the points of attack suggested but will mention only the main lines of inquiry such as (a) what are the cultural conditions which are conducive to the occurrence of this mold? (b) What sort of harvesting and curing, and furthermore, possibly what transportation methods make its prevalence more certain? (c) What are the fungi involved, the manner, time and condition of infection?

As a result of the investigations to date we know that several different fungi are concerned, each of which may apparently cause a mouldy nut. A large per cent of mouldy nuts are those which fall with husks attached but are considered clean after the husks are removed. The data accumulated on this point seem to warrant a recommendation that such nuts be kept and handled separate from those dropping free from husks.

Pruning experiments with walnuts directed by Dr. H. S. Reed have been under way since 1917. These represent trials of various methods of pruning but inasmuch as Dr. Reed is away a statement of what he might consider the results to date could not be secured. I believe, however, that the moderate pruning is the most promising.

The above briefly described projects are all that may be considered as strictly cooperative.

There are three other projects, however, on walnut problems to which I will refer but briefly. Two of these will be discussed here today so I will merely mention the titles. Melaxuma of Walnuts, by Dr. H. S. Fawcett, and the Codling Moth of Walnuts, by Prof. H. J. Quayle. The third is a problem of long standing and one we feel always offers an opportunity for study; I refer to walnut blight. As a result of further study on the subject by C. O. Smith it can now be stated that the blight organism has been found on the leaf and catkin buds sometime before growth begins in the spring, but probably causes little or no infection until the new growth appears. Further, that water as fog or rain and pollen from infected catkins act as a medium in which the organism can grow.

Other investigations by artificial inoculations indicate differences in the resistance of several commercial varieties to walnut blight, the Ehrhardt apparently being less susceptible than the Placencia and seedlings. This seems to be confirmed by orchard observations.

Again I express the appreciation of the citrus experiment station staff of the very sympathetic and liberal cooperation given by the walnut growers association. It has been stimulating to all who have been engaged in attempts to solve the various and often perplexing problems.

GETTING A HEAD START

Grape shippers of the Lodi district of San Joaquin County have had their fill of shortage—car shortage—and are already laying plans to assure better conditions for the next shipping season. They have started a careful survey which will enable them to compute very closely number of cars needed to keep their grapes moving.

The Lodi Growers and Shippers' League at a meeting February 2 completed its plans. Managers of several of the shipping companies were present and all agreed to back and support the new plan as adopted in the following motion:

That each shipping concern be requested to furnish the secretary on or before February 9, 1922, a list covering their clients for the last two shipping seasons, stating name and address of growers, location of property described as to section, township and range, the number of acres of each variety of vines or trees, approximate age of each, total map acres his place covers, information referring to the total or partial tonnage for the previous years.

This information as turned in by the companies will be checked against the vine count as submitted by the grower himself and with such a check should form an undisputable basis for computations necessary in the allotment of cars during the coming season.

It was the sense of the meeting from information at hand that there will undoubtedly be a very severe car shortage at the height of the season, and growers are enjoined to send their reports to the secretary immediately.

AVOCADO AREAS

At the avocado meeting at the Spinks ranch, January 25, one of the speakers, former President Thos. H. Shedden, said: "In a tour of investigation over the principal avocado sections we found two practically immune to frost injury: the upper part of this ranch and North Whittier Heights."

The writer later made a longer and more searching trip over the same and other territory and found the statement true, though other spots, in other sections, were likewise free from serious frost injury. But the two districts named are wholly unlike in one respect. Aside from Mr. Spinks' ranch there is no land available near by for planting except on the adjoining Bradbury ranch. Fortunately, in the North Whittier Heights district there are hundreds of acres in the so-called frostless belt and if to these are added those on the other side of the hills, or the upper lands of the La Habra Valley, the safety zone for Guatemalan avocados may be extended to, possibly, a few thousand acres.

The writer visited the orchards of such well known "avocado men" as J. M. Elliott, E. G. Hart, R. M. Teague, B. H. Sharpless and many others, also nurseries of young trees on the hills skirting the La Habra Valley, and was gratified to find all such stock still in salable condition. During the past half century the valley lands have been cultivated, while the hill lands have been left for sheep runs, largely for lack of irrigation facilities on the latter. Even now, with ample water supply, those who are putting these hill lands on the market informed the writer that the little lateral valley lands command twice the price of hilly land in the same tract. Yet a critical examination of existing plantings show that only on the higher ground were plants absolutely free from frost injury. We have had much fun with the familiar expression, "take to the hills," but we may have to do so in order to play safe with the Guatemalan varieties of avocados. But even this is, to a certain degree, a puzzle, for wind is a controlling factor, and sections passing free in the still lower general temperatures of 1913 were frostbitten in 1922. This has proved, however, more true in the mesa lands than further into the hills.

This 50th Anniversary Catalogue
Is Yours Free—for the Asking

This Golden Jubilee Catalogue is your 1922 guide to correct prices. It sets the low price standard for America, and tells you how little you need to pay for everything you buy. One copy is yours, entirely Free. You only need fill in the coupon below.

Do You Know the
New Low Prices?

Do you know how little you should pay for everything you buy? Do you know today's correct low prices?

This book is a price standard. Every price is based upon the new costs of production, upon today's cost of new, fresh merchandise.

Twenty-five million dollars' worth of new, fresh merchandise has been bought and is being made for this catalogue. We have no big stocks of left over goods bought at high prices. Everything in this book is new—everything of latest style—everything fresh—everything offered at today's lowest possible prices.

Everything for the Home,
the Farm and the Family

Everything that goes into the home to make it more modern and complete, from wall paper to curtains, lighting fixtures to rugs—everything at Money-Saving Prices.

For Men and the Farm: Everything a man needs from clothing to tools—everything for the farm and the farmer's use. Everything at guaranteed lowest prices of the year.

Clip the Coupon Now—
Mail it Today

You can not realize how low these prices are till you see this book—until you see the pictures, read the descriptions and compare the prices.

We want you to have this book. We want the readers of this magazine who do not buy at Ward's to know how much they can save, to learn the pleasure and satisfaction of always getting dependable goods—of always getting a Golden Rule deal every time they buy.

We want you to learn the new-old spirit of Ward's—progressive, forward looking, alert to give you better service, and bigger and bigger values. So we offer you one copy of this Golden Jubilee Catalogue FREE—You simply need to fill in the coupon below.

CROP INSURANCE—IS IT FEASIBLE?

(Continued from Page 173.)

statistical analysis of the facts regarding such calamities could determine the regularities which a sufficiently large number of instances of national disaster would be, if properly studied, certain to show. Such regularities, however, if once discovered, would furnish an 'actuarial basis' upon which an insurance of individual nations against such risks could conceivably be undertaken."

And in the eleventh edition of the Encyclopædia Britannica, in the article upon "Insurance" written by Charlton Thomas Lewis, Ph.D., a great authority upon the subject, I find these words:

"The value of insurance as an institution cannot be measured by figures. No direct balance sheet of profit and loss can exhibit its utility. The insurance contract produces no wealth. It represents only expenditure. If a thousand men insure themselves against any contingency, then, whether or not the dreaded event occurs to any, they will in the aggregate be poorer, as the direct result, by the exact cost of the machinery for effecting it. The distribution of property is changed, its sum is not increased. But the results in the social economy, the substitution of reasonable foresight and confidence for apprehension and the

sense of hazard, the large elimination of chance from business and conduct have a supreme value. The direct contribution of insurance to civilization is made not in visible wealth, but in the intangible and immeasurable forces of character on which civilization itself is founded. It is pre-eminently a modern institution. Some two centuries ago it had begun to influence centers of trade, but the mass of civilized men had no conception of its meaning. Its general application and popular acceptance began within the first half of the 19th century, and its commercial and social importance have multiplied a hundredfold within living memory. It has done more than all gifts of impulsive charity to foster a sense of human brotherhood and of common interests. It has done more than all repressive legislation to destroy the gambling spirit. It is impossible to conceive of our civilization in its full vigor and progressive power without this principle, which unites the fundamental law of practical economy, that he best serves humanity who best serves himself, with the golden rule of religion, 'Bear ye one another's burdens.'"

Insurance Truly Cooperative

It might almost be said that if insurance were universal and included all the hazards of life it would be a practical form of socialism, for it distributes the losses of the few among the many without diminishing the in-

centive to individual effort. But the question is, can it be applied to the hazards of agriculture and would the government be justified in undertaking it? We all know that one of the farmers' greatest difficulties is that he is compelled to be a speculator and to take risks that are not calculable. He is in fact a gambler against his will, for gambling is defined as hazard without calculation in contradistinction to speculation, which is hazard with calculation. The farmer must cultivate his land or see it go to waste. He has to plant some crops, such as winter wheat, in the autumn and others in the spring, but he cannot have any assurance of the prices that will be obtainable for them six or ten months later. He is, moreover, exposed to the hazards of the weather and innumerable agricultural pests in the interval.

The merchant who is not reasonably certain that he can sell goods will not buy them or will reduce his inventories, and the manufacturer who is not assured of a profitable market for his product will shut down his factory and let his labor remain idle. But the farmer cannot follow these examples. He has to plant his land at planting time or allow his investment to remain idle and deteriorate for a year.

If he decides to plant he will probably become a borrower on obligations that mature concurrently with his crop. The whole financial system

of the northern hemisphere is organized upon a plan which contemplates an autumnal liquidation of agricultural debts. Within one or two months the farmer is compelled to sell the crops that represent the labor of the year just ended and the world's consumption for another year just commencing. The result is congestion and a buyers' market in which the seller is at a great disadvantage.

What is the remedy? Surely there must be one. If it is to be found in crop insurance it should be speedily applied.

Crop Insurance No Novelty

Crop insurance is not a new idea. At least two joint stock fire insurance companies and several mutuals have tried it, but they had no experience upon which to base rates, and found that in order to get a fair average they would have to blindly accept risks so large that their capital might be jeopardized. Even to those who know but little about the science of underwriting it is plain that a very large number of widely scattered crops would have to be insured before the probable percentage of loss could be ascertained.

A rate so high that it would absolutely protect the insurer would be regarded as extortionate and no one would take out a policy, while a rate that was too low might bankrupt the underwriter if he did a large business or had many risks in one locality.

Then there is the question of determining or measuring the farmer's loss. Manifestly it would be unwise to allow him to insure his crop for any valuation he chose to put upon it. An over valuation would be an incentive to neglect and extravagance and would lead to the presentation of many unfair or fictitious claims. On the other hand an under valuation would not give the protection required.

In so far as any rule has been applied by those companies who have written crop insurance the practice seems to have been to insure the actual cost of production up to a certain maximum per acre and to require that the farmer insured must furnish satisfactory proof that the amount claimed has been actually expended.

In some cases crop policies have also contained a provision making the farmer a "coinsurer" for 20 per cent of the risk so that he would have an additional incentive to avoid loss. The price of the crop insured at planting time is another factor that must be taken into consideration if the indemnity provided is to cover a possible deficiency between the proceeds finally realized at harvest time and the ascertained cost of production.

It seems reasonable to assume that if prices were low when the crop was being sown the risk would be less than if prices were high. The cost of production would be smaller and the chance of an advance in values that would offset crop failure would be greater. As a generalization therefore we may conclude that rates ought to have a direct relation to the prevailing values for agricultural products when the policies were written. But in its other aspects the problem is not so simple.

Farm Survey Practicable

The cost of producing a crop varies in different regions or on different lands. In the Atlantic states fertilizer is required to produce a good cotton crop. In Texas fertilizer is not used. The cost of labor also varies in different sections.

These are factors that would have to be taken into consideration in determining the insurable maximum of production costs.

It might be necessary to have each insured farm surveyed in order to fix rates and insurable values fairly. This would seem to involve an appalling amount of detail, but does it? Every building in almost every city and town of the United States has been surveyed in the interest of the fire insurance companies.

In most fire insurance offices there are to be found huge books of maps on which the area, height, construction, fire exposure and hazards of every building in every city of the United States and Canada are accurately set forth. These maps are kept up to date by the company which issues them. The corrections are made by pasting the maps of new

The Mightiest Servant in California

PICTURE IN YOUR MIND a strong, tireless servant—one ever alert—one that constantly serves, day and night, over 1,700,000 people.

Think of a servant—so domesticated that it warms, lights and makes comfortable the homes of the land—so vigorously powerful that it whirls the massive wheels of factories and hauls trains at breakneck speed.

The Pacific Gas and Electric Company is such a servant. Its service lightens the burdens of housewives. It enables the farmers to take advantage of labor- and time-saving devices. Industries rely upon it for power, light, and fuel.

Service is the only thing this Company has to sell, a service so *great—important—necessary* that confusion, disaster and even loss of life would result if it were not constantly maintained.

Pacific Gas and Electric Company

P.G. and E.

"PACIFIC SERVICE"

Whom the P. G. and E. Serves

Gas for heating and lighting purposes is furnished to over 297,270 consumers by this Company.

More than 285,062 customers depend upon it to provide them with electricity for light and power.

Water is supplied to over 16,162 patrons, and 475 customers purchase steam from this concern.

Transportation is furnished to thousands of people each day by the street cars whose propelling force is supplied by this Company.

buildings over those which have been demolished.

According to the last census there are 6,443,336 farms in the United States. The number of buildings in our cities is not known, but New York City alone has over 600,000 and the total in all cities is probably well over 6,000,000. If they can be mapped as they are, the feat of surveying the farms would not seem so difficult and the information in regard to soil, area and productivity thus made available would be invaluable.

With it as a basis, equitable rates for writing crop insurance could be speedily established and with a crop insurance policy added to the other security that a farmer can offer his financial problem would be much simplified.

The general use of crop insurance would benefit the farmer and the country in many other ways upon which it is not now necessary to elaborate. The fact that the farmer could if he chose protect himself against the great risks and ruinous losses to which he is now exposed is a sufficient reason for considering whether the government ought not to provide the machinery and credit requisite if crop insurance on a large scale is to be made immediately available.

Most people are wisely opposed to having the government enter any business that its citizens can handle, but here is a business that private capital cannot undertake because of its novelty and magnitude. Would it not therefore be well for the president or congress to immediately appoint a committee to make a careful study of the subject with a view of ascertaining whether it would be practicable and expedient for the government to establish a crop insurance bureau from which the farmer could buy policies that would indemnify him for his actual and reasonable expenditure and from which after a few years the larger insurance companies who were willing to do the business could obtain data upon which to base rates?

War Risk Insurance Profit \$17,000,000

Shortly after the outbreak of the war on the 1st of August, 1914, the British government undertook to insure the marine war risks to which vessels and cargoes under its flag were subject. Almost concurrently, the then secretary of the treasury, Wm. G. McAdoo, asked congress for authority to organize an American war risk insurance bureau for insuring hulls and cargoes under the American flag. The necessary legislation providing an initial fund of \$5,000,000 was passed. The bureau was organized and was functioning by the 2nd of September, 1914. It continued in existence until the end of the war. Its record is remarkable.

The total of the policies issued was \$2,250,000,000. The premiums received amounted to \$46,000,000, and the losses paid were \$29,000,000, leaving a profit of \$17,000,000. The expense of conducting this enormous business for the four years was only \$165,000, or hardly more than one-third of one per cent upon the premiums received. When compared with the cost of conducting the insurance business under private auspices these figures seem to be almost incredible and they are an effective refutation of the frequently repeated assertion that government management is always inefficient and extravagant.

It is, however, only fair to say that the bureau had the advantage of being able to commandeer the services of some of the ablest underwriters in America. Its director was William C. De Lanoy and its advisory board consisted of Hendon Chubb, William N. Davey and William R. Hedge. For little or nothing these men gave their time to the work as a war duty, and while the great success of the bureau was largely due to the authority and credit of the government it would be uncandid not to recognize the share that those named and many others had in the results achieved. As the business grew congress appropriated a further \$45,000,000 as additional working capital for the bureau, but not a dollar of the total of \$50,000,000 put at its disposal was ever drawn, as almost from the first the premiums received exceeded the losses and expenses incurred.

I have been unable to obtain exact information with regard to the insurance business conducted by the British government, but those that are "in

the know" believe that it was also highly profitable and it is generally admitted that both the American and the British bureaus rendered a very substantial and necessary service to the shipping and trade of the respective nations.

Why Not Crops?

In an article published in the New York Times of Monday, December 26, 1921, advocating a ship subsidy there is included a proposal that "the government should create a non-profit making corporation to insure its own ships and to offer hull insurance at cost to privately owned American vessels." It is explained that "For the organization of a non-profit making insurance corporation a \$10,000,000 loan will be necessary" and that the cost of handling cargo insurance is estimated at about \$1,000,000 for the first year and a decreasing amount each year thereafter, the loss ultimately vanishing.

If the government is willing to do this for shipping it ought not to hesitate in doing at least as much if not more for our infinitely more important agricultural industry, and I earnestly recommend the idea to its consideration.

The difficulties that seem so great in prospect would, I believe, disappear in practice and it is highly probable that after the first year or two the business would show a profit and pro-

duce an income that would more than pay the cost of conducting it.

A LETTER FROM BROWNSVILLE, TEXAS

AM very glad to learn that you have decided to send me the California Cultivator in exchange for any articles which I might send you. Your letter of January 27 was very much appreciated.

The citrus fruit in the Lower Rio Grande Valley is progressing very nicely, and we find that we have many things to learn about this great industry. Previous to this year we have had very little trouble in selling our fruit, but we find that this year we have more fruit than local demand can consume. We have had a week of specializing on the valley fruit by the people of Houston, Texas. They took 11 cars of our citrus fruit and disposed of it. The papers of that city gave us some very good advertising. San Antonio has disposed of a few cars.

There is quite a large acreage being planted to citrus trees this year, and the majority of them are pomelos, or, as we commonly call them, "grapefruit." We believe that we can produce a better quality of this fruit than can either California or Florida. The most common variety of pomelos being planted is the Marsh Seedless with the Duncan running a close sec-

ond. Many people are planting the Foster on a small scale. The leading varieties of oranges are the Washington navel, Parson Brown and Valencia. We do not seem to have secured the best type of navel oranges. We must do more bud selection as we have some navel oranges that are fairly good, but the majority of them are poor. There are not very many lemons being planted. We have two lemon curing plants here in the valley, both located at Mission.

There will be over 250,000 citrus trees set out this year. We now have over a million trees in the valley. Only a little over a third of the trees set out this year will come from the valley. The rest will be shipped in from California and Florida. (The frost will decrease the California shipments.) The majority of the trees which we now have set out will come into bearing this next fall.

We have had no loss from frost this year. There were only 400' orchard heaters in this county last summer. As the result of a series of orchard heater demonstrations carried on by my office over 7,000 orchard heaters have been sold. The heaters were only used one night and then for only about four or five hours. There was no damage done by the frost except to very tender vegetation in unprotected fields.

We will have large shipments of truck crops to move from this territory this year. We have a very large

Plant an Orchard

Look to the roots—the foundation of your tree. No other district produces a tree of such well toughened fibre, so hardy and with roots so fibrous and well branched as our foothill soil and location.

Write us for complete copies of the announcements of the "Bergtholdt Plan." This plan is a vital issue to every fruit grower—to all California. It means your success and ours in fruit growing. The responsibility for this plan is upon every individual fruit grower—boost for it.

Growing fruit is the best paying business in California.

The acid test of any business is not what it will do under favorable conditions, but what it will do under adverse conditions.

Even under this year's depreciated values, the orchardist with a block of **Prunes, Bartlett Pears, Apricots, Cherries, Raisins, Shipping Grapes, Clingstone Peaches, Drying Peaches, Fall Pears, Almonds, Shipping Peaches, Shipping Plums, Canning Plums, and Figs** will make more money than the grower of grain, hay, alfalfa, beans, rice or the dairyman.

Every acre of land adapted to fruit growing that you now employ in growing grain, hay and other crops, is too valuable for fruit to be employed as you are now doing.

Every year that you grow these other crops instead of planting your acreage to orchard, represents not only a dead loss in money, but more than that, one year's loss of life's opportunities.

The trees you plant now will, five or six years hence, assure your share in the profits inherent to the California fruit grower.

We offer for your planting the most complete assortment of commercial fruit varieties.

Our trees are the best that care in propagation and efficient workmanship can produce.

Our catalogue, full of accurate practical horticultural information and suggestions, and our thirty years' experience in fruit growing, and fruit marketing, are at your service for the asking.

Submit us a list of your tree wants for quotation while the varieties you desire are still available in our foothill grown stock.

Write me today.

SILVA-BERGTHOLDT CO.

NEWCASTLE, CALIF.

A! Man-Size Job

DAY AFTER DAY, from morning till night, your grain drill is expected to measure out thousands of irregular shaped seeds. It must handle them rapidly and without injury. It must cut miles of uniform trenches and deposit the seeds evenly into the deepest cut of each trench. It must cover each seed at a uniform depth. This is a man-size job and the drill you select should have a proved reputation for doing the kind of work that produces results.

Rely on Kentucky Drills

Here are drills that have merited the confidence of farmers for more than fifty years. They are safe drills to use. Drive into your field with a Kentucky grain drill, and you may rest assured the seed will be put in the ground right. Every grain will get a square deal. None will be cracked, nor will there be any skipping or bunching.

These reliable drills are built in plain and fertilizer styles for horse or tractor power. Grass seed attachments can be supplied at the time of purchase or later. Furrow openers for any soil—double disk, single disk, or shoe.

Seeding time will soon be here again. There is no better time than now to get our new catalog. Write for it. The International dealer sells these drills.

cabbage acreage. We have had considerable trouble and damage from the aphids and thrip. These two insects have become very numerous in some fields and are cutting the yield of cabbage considerably. However, during the last 11 days we have had cold wet weather and quite a few of them have been killed. Yet we are hoping that we will receive a hard drenching rain which will help us in our fight against this insect.

It is planned to plant out a large acreage of early tomatoes and melons. The growers are very optimistic and many of them have large acreages in which the plants are well up and are growing nicely. The acreage in spring potatoes will also be very large.

With best wishes for your paper, I remain, very truly yours, Louis H. Alsmeyer, County Agricultural Agent, Cameron County.

MELAXUMA OF THE WALNUT

(Continued on Page 171.)

growing season begins the next year. Even in severe cases it may take sometimes three or four years for a canker to completely girdle a large limb and cause its death.

Investigations as to Cause

The first investigation of the disease was made in the early part of 1913 by W. H. Nixon and C. A. Hollister, students of the University of California, who proved that the disease was infectious by transmitting it from active cankers to perfectly healthy limbs by means of infected ax or chisel cuts, and also by inserting pieces of diseased bark from active cankers into healthy limbs. In the latter part of June, 1913, further inoculation experiments by the writer with material from active cankers showed the same results as those obtained by Nixon and Hollister. A fungus, *Dothiorella gregaria*, was then discovered in the diseased lesions and numerous inoculations with pure cultures of the fungus reproduced the disease in sound bark. In this way it was proved conclusively that this fungus was the causal agent in producing the lesions.

Later cankers identical with those on walnut trees were discovered on a common species of native willow in Santa Barbara County. On microscopical examination and culture tests the same fungus was found to be present on the willows. Cankers were found on willow trees not only on the edge of walnut orchards but on trees far away from walnut orchards. It is believed that the disease may have originally come from the native willows in Santa Barbara County to the walnut trees there.

Probable Methods of Natural Infection

As was stated before, the usual place for cankers to begin is at the crotches of the large limbs, or at forks of branches, or where a smaller twig joins a main branch. They often start also at injured places at any point on the bark of the trunk or branches.

On an examination of older walnut trees it will be seen that at the crotches at the angle between branches there are distinct lines of rough bark that have been pushed up and broken by the growth pressure of the bases of the two adjoining limbs. These places with their extra amount of functionless bark cells are fertile places for the germination and growth of the fungus, which having once become thoroughly established as a saprophyte appears to be able to advance into the surrounding live bark. Another probable entrance for the fungus is in unavoidable injuries to the limbs when the pickers climb the trees or when poles are used to knock down the nuts. In some places also the woodpeckers line the bark with rows of small holes which would open up the way for the entrance of the fungus. Then it would seem that the small twigs, especially on the inside of large trees that are possibly weakened by shading, are attacked and the fungus passes easily from them to the larger branches, thus forming cankers.

Control

Having proved that this fungus was the cause, experiments were started to see what could be done in controlling it. Some of these cankers which had been produced by inoculation were cut out so as to remove all the diseased bark as well as the black killed wood underneath, and the wounds were treated, some with strong lime-sulphur

solution and others with Bordeaux paste, the same that had been used for the treatment of citrus gummosis. The results showed that the cankers could be stopped in this way and prevented from enlarging any further. Other cankers not treated enlarged until the limbs were killed by girdling. A large grower in Santa Barbara County cut out these cankers and dead limbs on a rather extensive scale, having treated more than 100 acres. The results of this work were quite promising. Most of the wounds where cankers have been cut out healed without further spread. In treating these trees on a commercial scale, the blackened wood in many of the areas was not entirely cut out because of the expense, and yet in most cases these also seemed to be stopped and showed no activity the next year. In one orchard of about 40 acres the work was more hurried at the last than at the first, the cankers and dead limbs not being cut out so thoroughly. In the part of the orchard treated last the results were not nearly so good, and a considerable number of cankers later showed signs of activity. In the part where the work was first begun and executed with more care, very few old cankers showed any signs of enlarging.

From the observations and results of experiments so far made the following treatment is recommended:

Cut out the cankers that have not gone too far on the trunk and larger limbs and disinfect the wounds thus made. The dead and discolored bark should be cut away, getting a little beyond the margin of dead tissue. If the cankers are not large and the wood underneath has not been stained deeply, it will pay to dissect out all the discolored wood as well as the bark. Probably one of the best disinfectants to apply to the wound is the Bordeaux paste, the same that is recommended for brown rot gummosis. The entire trunk and first crotches may be painted with this mixture as a preventive. Creolineum, carbolineum or other good disinfectants may also be used. If the canker is large and has been in the tree a long time the wood may be stained so deeply as to render the work of cutting out all discolored wood too expensive. If the canker has practically girdled the limb, the entire limb had better be cut out. Some weeks or months later after it is seen that the progress of the cankers is stopped and the bark is healing at the cut edges, the exposed wood should be covered with asphalt paint.

The formula for Bordeaux paste is as follows: 12 pounds of bluestone (copper sulphate) dissolved in 8 gallons of water in a wooden, earthen or glass vessel; and 24 pounds of quicklime slaked in 8 gallons of water. When the lime is cool stir together about equal parts by volume of each for making enough mixture to last for one day only. The bluestone is easiest dissolved by suspending it in a sack at the top of the water overnight. If the bluestone is pulverized and suspended in warm water it dissolves rapidly. Good lime that is not air slaked should be used, and after slaking it with the

water it should be allowed to cool before being used in making paste. If covered to avoid evaporation each ingredient will keep indefinitely, but after mixing the paste slowly deteriorates. Where it is being used over a number of days or weeks, just enough of the wet slaked lime and the blue-stone solution should be mixed to make paste enough to last for one day, leaving the remainder unmixed in separate vessels. It may be applied with large brushes as is whitewash. Commercial Bordeaux paste diluted with about equal parts of the slaked lime indicated above may also be used.

Legal Queries

Louis B. Stanton, attorney, 343 Wilcox Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 317 Central Ave., Los Angeles.

Joint Bank Account

Can a married man with grown children place money in the bank in such manner that after death his wife can withdraw it without going through legal process?—Subscriber, Dinuba.

The manner frequently used in doing this is to deposit the money in joint account, then either of the parties may withdraw by check.

Deed Delivered at Death

I wish to make my wife a deed of gift which shall not be recorded during my life. How shall I proceed?—Subscriber, Dinuba

There are two or three different methods of doing this. One and the simplest is to have the deed executed and acknowledged before a notary public and delivered to the grantee. The second is to deliver to an escrow holder to hold until death of the grantor. A caution should be given in this matter, however, that this manner of transferring property has probably given rise to more litigation and expense than any other known method.

Ditch Right of Way

A right of way was deeded by a former owner to a canal company and transferred to the present irrigation system. It has lain unused for some five or six years. My neighbor now claims the right to use this right of way. Can he do so and can I require him to use pipes instead of an open ditch?—Subscriber, Fresno.

It would depend entirely upon the terms of the grant, otherwise a right of way which is granted to one party is not available to any one else. As the grant stands in the name of the irrigation system it would not neces-

sarily be true that any individual would have the right to use this grant. On the other hand if he does have the right to use the grant he could use it with open ditches if such is the term of the grant and could not be restrained to the use of a pipe line although such use might be arranged by private contract.

Community Property

A wife sued her husband for divorce, was given alimony and custody of the child, but divorce was denied and there was no property settlement. All property was community property. Can she obtain her share thereof? In case of the death of the husband without will what share would the wife and child receive? He has brothers and sisters.—Subscriber, Los Angeles.

The divorce being denied the court would have no jurisdiction in property settlement. In fact, it is probably true that the alimony would be taken as in lieu of property settlement. In case of death of husband without will one-half of this community property would go to the wife. The remaining one-half would go one-half to the wife and one-half to the child. The husband could, however, dispose by will of this remaining one-half.

Separate Property

On death of a wife without will can a second husband claim a share of the property belonging to her prior to marriage? Can she will such property fully to children of the first marriage? There are no children of the second marriage. Would children belonging to the husband by a former marriage be entitled to a share of such property?—Subscriber, Orosi.

As this is all separate property it is wholly subject to the will of the wife and she can dispose of it as she pleases. It is only in case of her death without will that her husband could claim a share. In such event, as she has left more than one child, he would be entitled to one-third and the remaining two-thirds would be divided equally between the children by her former marriage.

MANY USES FOR ALFALFA

"A nearly perfect forage"—that is the height of praise heaped upon alfalfa by R. A. Oakley and H. L. Westover of the United States department of agriculture in a new farmers' bulletin, "Utilization of Alfalfa," just issued. And when the good qualities of this crop are enumerated it is evident that some such description is warranted. As a hay it is unsurpassed for general feeding; as a pasture it has a high carrying capacity and produces large gains; as a soiling crop it is valuable with proper handling; it makes excellent silage; and when ground into meal it is a good and easily handled feed. In addition to these good qualities it is of great value as a soil improver. Attempts have even been made to introduce it as a human food and as a medicine, but it can not compete with other staples as a food and it has no special medicinal properties.

Although not detailed enough to make laborious reading, each subject from haymaking on through to alfalfa meal manufacture, and a consideration of fake and fad alfalfa products, is treated so fully as to give the reader a thorough understanding of the possibilities of this great crop. Those who are inclined to be too enthusiastic over certain uses will find reason in the collected experience of many growers and feeders to modify their views, for alfalfa is not a panacea for all the troubles of the farm and feedlot. Consideration is given to the needs of dairy cattle, beef cattle, hogs, sheep, horses and poultry, and to the crop in various forms, including hay, pasture, silage, straw, soiling feed, tea and meal.

Those who are interested should write to the United States Department of Agriculture, Washington, D. C., for Farmers' Bulletin 1229, which will be sent free of charge.

Why does any healthy person want to be kicked into wakefulness in the morning?

Many people feel that they have to be agitated into wakefulness in the morning. They think that without the tea or coffee they take in the morning that they will not be able to meet the tasks and duties of the day.

Nothing could be more false than this reasoning. Any doctor can tell you this. For a healthy body does not require a stimulant. It gets all the stimulant it needs from food.

The thein and caffeine found in tea and coffee are irritating to the heart and nervous system. They jolt the nerves into undue activity. The result is a reaction. This is why regular tea and coffee drinkers think they must have their stimulant the first thing in the morning to wind them up for the day.

If you will stop using tea and coffee for a week, and drink Postum, the pure cereal beverage instead, it will give Nature an opportunity to rid the system of the irritating substances that harass your nerves, upset digestion, increase your heart action, and make you nervous and irritable.

Many people who have tried Postum say that inside of a week they wake in the morning without that "all gone" feeling that they used to have, and are full of energy, strength and endurance.

Order Postum from your grocer today, and make it according to directions. Your first sip of Postum will surprise and please you.

Postum comes in two forms: Instant Postum (in tins) made instantly in the cup by the addition of boiling water. Postum Cereal (in packages of larger bulk, for those who prefer to make the drink while the meal is being prepared) made by boiling for 20 minutes.

Postum for Health "There's a Reason"

Made by Postum Cereal Co., Inc., Battle Creek, Mich.

Some of the Costs of Fumigation

SIMPLY for the sake of giving an idea of the awful cost of insect control to the citrus section of the fruit growing industry we quote a few short paragraphs from the annual report of Horticultural Commissioner Ryan of Los Angeles County:

"Approximately 50 per cent of the citrus acreage of the county was treated by fumigation or spray for scale insects. Our records show that over 28,000 acres were fumigated and 4,000 acres sprayed.

"Artificial control of citrus insects has never been entirely satisfactory and there is always much argument between growers as to the best methods of scale control. In the hope of securing information pertinent to this old controversy this office inaugurated in the summer of 1920 a system of reporting on grove conditions throughout the county. The first year the condition of 1,345 groves was recorded. This year a total of 3,142 groves and 35,000 acres was reported on. Scale conditions in orchards having had one method of treatment were compared with conditions in orchards treated by other methods, taking into consideration the condition of the same groves 12 months ago.

"It was found that of the orchards in good condition one year ago 87 per cent of those which had been given one fumigation were in good condition this summer as compared with 31 per cent of sprayed groves. Of the orchards which were in poor condition in 1920 and fumigated, 55 per cent are in good condition in 1921; of the sprayed orchards 14 per cent are now rated as good. Of orchards graded in 1920, 1,671 were later fumigated once and graded in 1921. They are in better average condition than they were a year ago by 15 per cent. Two hundred and fifty-eight of the orchards graded in 1920 were later sprayed. These are now in 11 per cent poorer condition than one year ago. Untreated orchards are 22 per cent worse than in 1920.

"These comparisons are between the so-called liquid gas method of fumigation and the proprietary sprays commonly called 'arsenical' sprays because of the use of lead arsenate in

combination with sulphur and soap powder. There were too few groves treated with other methods of fumigation or with other spray materials to make further comparisons.

"A very complete record was obtained this year of grove conditions in all parts of the county, and we believe we will be able to render a thorough report of results secured from each of the many different methods of treatment sure to be used the coming season. A large number of groves will be treated with the cyanofumer machine and considerable work will also be done with the pots in addition to the liquid gas method in common use. It is, therefore, hoped that a definite comparison may be made between the three systems of fumigation.

"The city lot fumigation work was handled in the same manner as last year. Contracts were let to the lowest bidders, who were furnished with copies of notices served by district inspectors, solicited the work from the interested property owners at set prices, and made their own collections.

"It was necessary to pay out \$1,184.58 for fumigating orchards neglected by owners. All of this was either collected or protected by liens on July 1, 1921.

"Natural control of black scale is being attempted by the colonization of a small internal parasite, *Aphyus lounsburyi*, imported from South Africa by the state department of agriculture. This insect was established in Ventura County with complete success.

"District horticultural inspectors are cooperating with the state department of agriculture and with the California Fruit Growers' Exchange in carrying on this work. While the scale conditions in citrus districts east and north of Los Angeles city do not seem suitable for the establishment of the *aphycus*, there are several thousand acres in the county where it promises to do efficient work. Unfortunately, in most of the acreage in these sections the red and purple scale are prevalent and artificial control will be necessary, even if the black scale parasite should prove effective."

Grapefruit---Pomelo

THE other day Bob (alias R. M.) Teague was in Imperial Valley and was interviewed by a local paper and of course asked as to citrus growing possibilities in the Imperial. Because of Mr. Teague's long study of citrus conditions and citrus possibilities his opinion is of value, and from the interview we quote:

"There's no use dwelling on the wonderful fertility of your soil. This is too well known to need elaboration. However, it is always a debatable question as to just how well the soil, climate and other local conditions are adapted to citrus culture. We have had an opportunity this week to inspect most of the bearing orchards from Calipatria south to the border, and I have been firmly convinced that the growing of grapefruit will assume a large place in the future prosperity of the valley. Now listen! That word grapefruit is a misnomer—pomelo is the proper name. Because the fruit is prone to set somewhat in clusters in the same manner of grapes, the name grapefruit has come into general use and in order to be generally understood we have to use it whether we like it or not.

"There is no question about your ability to raise good grapefruit and plenty of it. I have seen seven year old trees here—not one tree but acres of them—that are as large as ten or twelve year old trees in our section, which are producing an average of

ten picking boxes per tree and better of fruit that I have never known to be excelled for flavor. The fruit ran uniformly to desirable sizes for marketing, but were small at one place where the trees had been grossly neglected for both water and cultivation.

"Your grapefruit has been introduced to the trade of the Pacific Coast cities from San Diego to Seattle and has met with such a hearty reception that the fruit from other places can not compete with it except when offered at a heavy discount in price. Authorities very generally agree that grapefruit grown in the coastal counties south of the Tehachapi does not reach prime marketing condition before April or May and a considerable part of it is usually held back until July and August. By developing your markets in different centers you should be able to clear up a big crop by March.

Navel Oranges

"Hardly know what to say about navel oranges. The point at issue seems to be whether the trees will set full crops or not with any degree of regularity. A spring cover crop coupled with the maintaining of sufficient moisture in the soil may prevent the 'June drop.' The navels shown at the Brawley show and those we saw of the trees are real Christmas oranges. In addition to size, sweetness, juice and flavor they were the most brilliantly colored navels I have ever seen. It was sunshine, painted and burnt in red."

How to Save in Painting—

Farm Buildings, Machinery, Etc.

REMEMBER first, it is what paint covers that you want to save—not merely a few cents per gallon in the purchase price of paint.

Note how the best paint spreads easier and covers more square yards than cheap paint does.

Figure in the *extra gallons* of cheap paint that you must buy, and the extra cost of application.

It means that cheap paint costs just as much as good paint on the house or barn.

The best paint then gives five or more years' protection to your property investment if properly applied. Cheap paint, on the average, starts cracking in twelve months. Which paint costs less?

72 Years Experience

The paints we specify for farm use are the result of 72 years' experience in making paints and varnishes for every purpose.

Made to stand the peculiarities of western weather.

The best materials—PURE PIONEER WHITE LEAD, pure linseed oil, zinc and color—are combined with long-time skill, in scientifically exact proportions.

Our white lead base must pass through a silk screen with 40,000 meshes to the square inch. A patented purifier makes it "whiter," so Fuller colors are exceptionally clear. The paint when applied on the house is a beautiful elastic, tough, protective coat.

Such paint costs but a trifle more to buy per gallon and is five or more times more economical in service rendered.

Cheap paints are costly—in the long run—good paints save money—they protect. Remember that when you buy paint. Don't allow surfaces to rot. It costs less to paint them.

Fuller's SPECIFICATION Farm Paints

House Paint-Barn & Roof Paint
Wagon Paint-Rubber Cement Floor Paint

M'd by W. P. FULLER & CO., San Francisco

Pioneer Manufacturers of Paints, Varnishes, Enamels, Stains and PIONEER
WHITE LEAD for 72 Years. Established 1849
Branches in 16 cities in the West—Dealers everywhere

HOUSE PAINT: Fuller's Pure Prepared Paint, Phoenix Pure Paint, for Painting Houses. The purest, best protective and most durable paint manufactured—32 colors.

BARN AND ROOF PAINT: A protective coating for barns, roofs, fences. Dries with a good gloss and wears. Economical in cost and dependable in quality. Six colors to select from.

FLOOR PAINT: Fuller's Rubber Cement Floor paint—sanitary, waterproof and durable paint for floors and kitchens, closets, etc. Attractive in

color and gloss. Dries hard overnight. Made in 12 colors.

IMPLEMENT PAINTS: Fuller's Pacific Wagon Paint adapted for repainting agricultural implements, farm wagons, farm machinery, wind mills. A glossy, durable finish offered in 7 colors.

Also makers of All-Purpose Varnishes, Silkenwhite Enamel, Fifteen-for-Floors Varnish, Washable Wall Finish, Auto Enamel, Porch and Step Paint and PIONEER WHITE LEAD.

Advice on Painting Free

If you want to do your own work and get the best results, ask our Specification Department for *free advice*.

We'll tell you how to treat old paint, how many coats to use, what kind of brush, etc.

Use *Fuller Service* as well as Fuller Paints and Varnishes to insure good work.

Free Books Mail the Coupon

Send the coupon for "Save the Surface," a free book that tells why good paint is vitally important on your place—why your house, barn, silo, and machinery should be protected.

We'll send with it our small booklet of Fuller's Specification Farm Paints and Varnishes. You need both books. Send for them now.

W. P. Fuller & Co.
Dept F-23 San Francisco.

Please send me, without charge, a copy of "Save the Surface" and your small booklet of farm paints and varnishes.

Questions and Answers

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Planting Two Year Grapevines

I planted some grapevine cuttings last year in rows six feet each way. It is doubtful whether or not I shall be able to plant them out in vineyard form this year. Would they do all right if I plant them out next year, or are two year old vines hard to transplant?—Subscriber.

Rooted vines one year old are best for planting in a vineyard, although two year vines may be used with satisfaction if they have not made an excessive growth or if they are not dug and replanted at the end of the first year. The usual objection to the use of two year old vines is that if dug and then replanted and dug again the second year roots are in pretty bad shape. If you cannot use the vines this year it might be wiser to dig them and sell them to some one who can, putting out cuttings for your own use.—F. K. H.

Hubam

Having so many queries as to Hubam clover and its behavior in California we have asked George W. Hendry as to any experimental plantings made in California. Prof. Hendry writes:

"We have grown Hubam clover at the university during the past season planted in three foot rows, February 20, 1921, with Melilotus alba planted adjacent as a check. Irrigations were given June 28 and July 21. On August 1 Hubam clover stood four and one-half feet high and was in full bloom. M. alba on that date stood three feet high and did not blossom during the season. Hubam continued to blossom and set seed until killed by frost on November 16. Portions of both plats were cut for hay September 1. Hubam hay was coarse and woody. M. alba hay was finer and softer. There was nothing to choose between them in taste and both were very bitter. Hubam yielded at the rate of 3.35 tons per acre (green weight) and M. alba 4.8 tons per acre. M. alba is more branched and is a denser and more compact plant. Samples of both of these varieties, together with common alfalfa, cut and cured in the same way, were submitted to Professor Jaffa for an analysis on September 1."

Two Distinct 'Mums

Could you advise me what kind of commercial fertilizer would benefit mesembryanthemum? It is growing on a hillside in a heavy, stony soil. Some of it makes a good growth but a good deal of it is short and brown. Should it be watered in the dry season in this locality?

Also, should pom-pom chrysanthemums be separated in the spring the same as the standard sort or would it be better to allow the plants to grow unseparated, a profusion of small flowers being desired?—Subscriber, Oakland.

It is certain that mesembryanthemums need no fertilizer when growing in a "heavy strong soil" for in nature they grow in a very loose sandy soil, often heavily impregnated with alkali. In such soils they root deeply and the roots are always moist, for nearly all species grow near the sea. In heavy soils they doubtless suffer for need of water, which should be given. Pom-pom chrysanthemums should be treated the same as the larger flowered types and be divided now, either to plant out in permanent position or as a source of cutting for later propagation. Commercial growers and professional gardeners start anew each year from rooted cuttings, not from clumps. The best time for making these cuttings is from March 15 to April 1 and they are planted in the garden from May 1 to May 15 by the best growers.

Spotted Livers

I am asking for an explanation of a diseased condition of my rabbits. White sacs containing a thick, milky white fluid are present in large numbers in the livers. What is the nature

and cause of this condition? Is there a remedy? Can the muscle meat of rabbits so diseased be safely eaten?—Subscriber, Chula Vista.

A very small parasite, with a big name—coccidia, or fluke, is the cause of the spotted livers, which may invade other organs causing chronic anaemia, wasting diarrhea and death. The disease is contagious and we would advise not using the same hutches without disinfecting thoroughly and removing all droppings, burning or burying them.

These parasites infest wet greens on which rabbit manure containing them has been spread, also wet hutches or the ground beneath. They spread from the old stock to the young and may be spread by the sneezing of affected animals. It is easier to prevent than cure. Cleanliness is absolutely necessary. Would advise doing away with does that produce infested young. Feed plenty of dandelion and other medicinal weeds, scald and disinfect all vessels used. If the liver is not too badly spotted the muscle meat may be used—if the animal does not show other signs of diseases—but not the liver. Stock is often purchased that is infested.—W. D. W.

Strawberries

What kinds of strawberries are best suited for the climate of San Diego County? Do strawberries have to be replanted every other year?—Subscriber, San Marcos.

In the south end of the state the strawberries now most generally planted are: Carolina, Brandywine,

Pioneer Nursery of Monrovia

Plant for Profit

Coates No. 1403 and

No. 1414 Prunes

Very heavy bearers. Fruit graded mostly in 40/50 and 50/60 class. Good growers, dry well. We have some extra fine one year, branched trees for immediate delivery on peach root. Suitable for all soils except extremes of wet and dry. Write for catalog.

Leonard Coates Nursery Co.
Morganhill, Cal.

Klondike, Banner and Gibson. They do not need replanting every other year and beds, if properly pruned and fertilized, are maintained at a profit for several years, depending wholly upon condition and crop. When so matted (or from other cause) that yield falls off materially, the need of renewal is indicated. The present is the best time for planting or transplanting.

Asparagus Culture

Please tell me at what time and how to care for a two year old asparagus bed.—Subscriber, Esparto.

The present is the golden time for attention to asparagus beds. The chief requirements are abundant supplies of food and drink. So necessary is a heavy food supply that many planters plow a deep furrow, put in a quantity of stable manure and plant roots on top. In old beds the same furrow system is often used for application of fertilizer between the rows. Commercial fertilizers are heavily applied. Ten tons of barnyard an acre is not too much, and experiments have proved that 446 pounds of nitrate of soda, 300 pounds of acid phosphate and 260 pounds of muriate of potash to the acre produced best yield. The fields should be kept free from weeds at all times.

Pecans and Poultry

Any information or advice re the pecan or poultry industry will be appreciated.—Subscriber, San Diego.

This is surely rather a long commission for there is not a little published on pecans, and as to poultry there are whole libraries. Regarding pecans we would suggest that you write a letter to the Department of Agriculture, Washington, D. C., asking for Bulletin 51 of the bureau of plant industry, "The Pecan." Also Bulletin 30 of the bureau of plant industry, "Budding the Pecan"; Farmer's Bulletin 332, "Nuts and Their Uses as Food" by Prof. Jaffa of this state. It is possible by applying to State Commissioner of Agriculture, Austin, Texas, one may

secure Bulletin 2, "Pecans and Other Nuts" and Bulletin 19, "The Pecan and Hickory in Texas." The Florida Experiment Station, Lake City, Florida, has also issued bulletins on pecan culture as has the North Carolina Department of Agriculture, Raleigh. As to poultry one of the most practical publications is "Poultry for Profit," by Jean A. Koethen of the Cultivator editorial staff, originally published at \$1. Only a very few copies remain and should this be republished today it would be at least a \$2 book. We trust inquirers will be as explicit as possible in asking questions. It is a physical impossibility to answer such general questions as above in this department.

Correspondence Schools

Could any of your subscribers give me any information pertaining to correspondence schools? If there are any persons who have taken a course how did they succeed? What do they think about them?—Subscriber, San Jose.

There is no question that many a young person has had his opportunity for usefulness in life vastly increased because of correspondence schools. Beginning way back in 1880 or 1882 the Chautauqua movement resulted in the establishment of the Chautauqua Literary and Scientific Circle. This was nothing more nor less than a course of reading or study with limited connection with the central or inspirational office of the institution. The work of that "circle" is nothing more nor less than wonderful. We do not think even the most enthusiastic of believers in the correspondence courses would consider them equal to a college course or the educational facilities given by personal contact with educators, but there are thousands of us unable to give to ourselves all the advantages we would like so we take advantage of correspondence courses. There are regular established schools operated for profit. There are others like the college of agriculture connected with the University which are conducting these correspondence courses. Anyone interested in agricultural or horticultural courses should write the college of agriculture at Berkeley for particulars.

Peach Variety

I note in your issue of October 1 a subscriber from El Cajon asks for information in regard to the best varieties of pits to plant for budding to the Hale peach. If he wishes to grow Hale's Early I wish he would write again and give his reason for wishing to grow that variety. I have had experience in growing peaches in Fresno County. But the varieties grown here are nearly all for drying or canning. The Elberta is a popular peach for shipping and it is about the only shipping peach grown here. I would like to know about Hale's Early; if it is a good shipping peach; if the tree is a strong grower and bears well; if it sells well as compared with other peaches. I mean for Fresno County.—Reader.

The new J. H. Hale is characterized as "A new valuable freestone of Elberta type, large yellow skin, brush of red, yellow flesh, tender, fine flavor, superb table and shipping variety." We will appreciate it very much if we may have from San Joaquin Valley subscribers their estimate of the worth of the Hale peach.

Caliper of Fruit Trees

When buying nursery stock what should a four to six foot pear tree caliper, and at what place is it measured?

There is such variation owing to kind of fruit, variety, etc., that it is impossible to give any hard and fast rule. The caliper is usually taken from one to three inches above the intersection of the bud with the stock. As a basis four to six foot trees should caliper at least one-half to five-eighths of an inch.

White Angora Rabbits

Can you please give me the names of breeders of White Angora rabbits? I would like to get a buck of that breed.—Subscriber, Orland.

We know of no breeder of White Angoras in California. Presume getting in touch with Eastern breeders (Continued on Page 199.)

RELIABLE SEEDS FOR SPRING GARDEN

Are you selling vegetables for the market? Or are you raising them for your own use? In either case you want the finest varieties of the early bearing specimens. You want them at the time they taste best and bring the best prices.

A & M Reliable Seeds

Aggeler & Musser Seeds, famous for their reliability, grow and produce the finest vegetables. A. & M. Reliable Seeds are thoroughly tried out in our testing grounds, and specimens which show the least defect are promptly eliminated. Only the best varieties for this climate are offered.

Be sure your dealer supplies you with A & M Reliable Seeds.

WHEN LITTLE GEORGE WASHINGTON WROTE A LETTER:

He ruled his paper with many a line,
And pen-points made in goose quills fine;
He dipped his quill in a horn of ink,
And wrote his letter with care, I think.
From a box like a salt shake, standing
nigh,
He shook out sand his ink to dry;
He blew off the sand; with many a pat,
He made of his letter an oblong flat;
Addressed it and tied it with linen
thread;
Sealed it with seals so big and red;
Then it went its way by coach or by
hand—
A long, slow journey across the land.

WHEN LITTLE G. W. JONES WRITES LETTERS:

He's only his fountain pen to get,
Or to sit at a typewriter—better yet;
Then dash off his letter; slip it in
An envelope, ready and gummed so thin;
Address it, stamp it, send it away,
And it comes to you the very next day!
But, do you know, G. W. Jones
Freely, frankly and fairly owns
That he would try hard and take all the
trouble
Of little George Washington—yes, and
double—
If he could but write one letter his sons
And the world would prize like Washing-
ton's!

HER AUNT MARGARET

By Elizabeth Earl in Forward

LL through the four days' journey Alice had been thinking about this latest discovery of hers—an aunt. To have an aunt was an altogether new experience to the girl, or rather, to know that she had an aunt. Before that wonderful discovery she had no one except a very much absorbed mother, a mother who was always busy writing or lecturing or recuperating from writing and lecturing, and to whom aunts did not in the least matter.

Families of any kind never had seemed to matter much to mother. Her own daughter had been a responsibility which she had borne dutifully, though hardly enthusiastically. Even father, as far as Alice could remember, while a joy to mother, as well as a responsibility, had never seemed like other girls' fathers. He and mother had been absorbed in each other and in very little else outside of their professions. Save for a general oversight, Alice had received very little of their time or attention. She had never dreamed they had any relatives other than herself. She of course, was a relative.

At the time of her father's death she might have been enlightened if she had been older. But grown people receive many letters which they do not account for to twelve-year-olds. And as no relative had ever been spoken of in Alice's presence, how was she to suspect that she had any?

And then suddenly, when Alice was sixteen, mother came in one day, dropped her furs on a chair, and said quite casually: "We'd better talk a bit about your future, Alice. The doctor tells me I shall not live a great while."

The girl looked up from a book she was reading—she adored reading—and stared at her mother.

"I don't think, mother," she remarked, "that I quite grasped what you said."

Her mother repeated. It never put her out if you didn't understand at once what she was talking about. As a rule, she hardly expected you to understand and you didn't. But this statement seemed clear enough, though rather incredible.

"I should like to finish my book," said mother. "I never have felt I made my theory about self quite as intelligible to ordinary intellects as it can be made. However, the doctor thinks it unlikely that there will be time enough. And I suppose in the long run it will not matter. I think it will be best for you to go to your Aunt Margaret. I am sure I have her address somewhere. I must look it up."

"My aunt?" Alice watched her mother's slender fingers tossing over the motley collection of papers she had tumbled out of the pigeonholes of her desk. "Why, mother, I didn't know I had an aunt!"

That discovery struck the girl at the moment more forcibly than her mother's other news.

"She is your father's sister," mother flung over her shoulder, "his only sister, I think, though he had brothers."

The girl walked over and stood by the desk where her mother was rummaging.

"But mother," she gasped, "why hasn't anyone ever told me? Uncles and an aunt! And I never knew I had anyone like that." Then a thought struck her. "Have—have you any?"

"Any what?"

"Any brothers or sisters?"

"No, indeed. What put that idea into your head? Oh, here it is!" She

held out a slip of paper. "Now, Alice, we will never speak of this again. I have no use for people who keep their eyes on such an event as it approaches. If I can, I shall finish my book. It will round out my work. When it becomes necessary for you to break up here, go to your aunt in Milton. That is near Boston. You might, I suppose, telegraph her that you are coming."

"But mother—"

Her mother paused in the rapid walk with which she was nearing her study door. In the face she turned to her daughter, Alice saw the approach of extreme concentration. Nevertheless she persisted.

"Can't you remember anything more?"

Mother looked helpless as well as in a hurry.

"You know, Alice, how hard it is for me to remember things like that. Your father told me, of course, I think he mentioned nine brothers."

"Nine!" gasped the girl.

"But he never spoke of but one sister, the youngest of the family, believe. Your father was the oldest."

"But why haven't we ever seen or heard from any of those people?"

"Your father was no correspondent and I—when do I have time for letters, Alice? The conventional attitude of kinsfolk has never impressed me. The accident of relationship does not make people interesting. In my case my work was more important. I there is nothing else—"

"Oh, no; I won't keep you! But if you should happen to remember anything more—"

Mother vanished inside the study door.

Nine uncles and an aunt! If hadn't been for the slip of paper in her hand, Alice would have thought in the days that followed that their talk had been a dream. The paper was no dream. It was real. "Miss Margaret Rankin, 9 Blank Street, Milton, Massachusetts." A dream does not deposit addresses typed neatly in black and white. The girl thought a great deal about her new aunt. What she was like she hadn't the faintest idea. Mother didn't know. Apparently it never had occurred to her to inquire, and what she might have heard had slipped out of her head. Thought of the new aunt occupied Alice's imagination, balancing, mitigating, that other part of mother's new which also claimed its place in the girl's thought.

Then suddenly one night, the night after she had finished her book, mother died in her sleep. Morning found Alice alone in the world. So she was on her way east to make her home with her Aunt Margaret.

She was very much excited. She had always craved relations, a big family of relations, from grown-up to babies, and to come into possession of even a single aunt was something. There were possibilities, too, in the uncles, though she knew nothing about them, not even their names or addresses.

Alice tried to think what this new possession of hers would be like. She pictured her as tall and slender and stately, with high-piled white hair—or it might be merely gray, for Aunt Margaret wasn't yet a really old lady. Probably she was deliberate and dignified. Or she might, of course, be little and brisk. In either case, Alice could hardly wait to see her.

The Clarks, with whom she had traveled for four days, left the train at Springfield.

"Only a few hours now, my dear, and you'll be with your people. Write after you get there. We shall want to know how you made out, though

of course nothing can go wrong. But wait just as she tells you to in the station."

Alice knew what to do. She had the directions by heart. Her aunt would wear a blue suit and have a pink rose in her coat, and would look for her in the waiting room in a spot she had indicated in her letter.

"In case we're a bit late, sit down and wait. We can't always count on car service."

Whom did the "we" cover? Alice wondered. She was hungry for people, plain people; not people with ideas, but people with babies and brothers and sisters and grandmothers. She wished Aunt Margaret had been married.

In the waiting room, balanced on the very edge of the bench, intent, eager, Alice watched for her aunt. She couldn't simulate calmness for she didn't feel calm. Were any of these other people looking for relatives that they had never seen? Surely not. They were too phlegmatic, too busy scurrying one way or another with immobile, expressionless faces. A woman leading two children passed her; an elderly woman with a little boy; three breezy schoolgirls. When a tall, angular woman approached, Alice' heart skipped a beat. Was she Aunt Margaret? No, the woman passed on, leaving Alice feeling that she had just escaped something.

Next came a whole flock of a family, followed by more girls, more women; a dainty dove-gray little lady—Alice jumped up on her approach, even though she wore no pink rose and blue suit. The girl began to feel anxious and a little lonely. Not that she could not take care of herself. But the aunt—so much hinged on what kind of woman this Aunt Margaret might be.

"This is Alice, I'm sure."

Alice turned to look down into the merry blue eyes of a girl her own age, a girl wearing a blue suit with a pink rose stuck through her belt.

"I'm Peggy," said the girl. "Ralph couldn't come, and Don's out of town this afternoon. Business snatched Ralph at the last minute. They're not really inhospitable—don't think that. In fact, they're keen on having you with us. Just give me your checks." (Continued Next Week.)

HOUSEHOLD QUERIES

"Burial of the Minnisink"—"Utah Carol"

Could you kindly publish the poem, "The Burial of the Minnisink," and name of the author; also words to the cowboy songs, "Bury Me Out on the Lone Prairie" and "Utah Carol." I do hope I am not asking too much and will appreciate your publishing these in the Cultivator for me.—Subscriber, Holtville.

We have not yet been able to secure words of "Bury Me Out on the Lone Prairie," but think we may soon get on track of it. Meanwhile, if any of our household readers have it in their home libraries and can copy and send to this office for publication, we, as well as our inquirer, will be grateful. Also, we will extend subscription to the Cultivator in return for the favor.

BURIAL OF MINNISINK

By Henry Wadsworth Longfellow
On sunny slope and beechen swell,
The shadowed light of evening fell;
And, where the maple's leaf was brown,
With soft and silent lapse came down,
The glory, that the wood receives,
At sunset, in its golden leaves.

Far upward in the mellow light
Rose the blue hills. One cloud of white,
Around a far uplifted cone,
In the warm blush of evening shone;
An image of the silver lakes,
By which the Indian's soul awakes.

But soon a funeral hymn was heard
Where the soft breath of evening stirred.
The tall, gray forest; and a band
Of stern in heart, and strong in hand,
Came winding down beside the wave,
To lay the red chief in his grave.

They sang, that by his native bowers
He stood, in the last moon of flowers,
And thirty snows had not yet shed
Their glory on the warrior's head;
But, as the summer fruit decays,
So died he in those naked days.

A dark cloak of roebuck's skin
Covered the warrior, and within
Its heavy folds the weapons, made
For the hard toils of war, were laid;
The cuirass, woven of plaited reeds,
And the broad belt of shells and beads.

Before, a dark-haired virgin train
Chanted the death dirge of the slain;

Behind, the long procession came
Of hoary men and chiefs of fame,
With heavy hearts, and eyes of grief,
Leading the war horse of their chief.

Stripped of his proud and martial dress,
Unburied, unreined, and riderless,
With darting eye, and nostril spread,
And heavy and impatient tread,
He came; and oft that eye so proud
Asked for his rider in the crowd.

They buried the dark chief; they freed
Beside the grave his battle steed;
And swift an arrow cleaved its way
To his stern heart! One piercing neigh
Arose, and, on the dead man's plain,
The rider grasps his steed again.

UTAH CAROL

Collection by Lomax, Author Unknown

And as, my friend, you ask me what
Makes me sad and still,
And why my brow is darkened like the
Clouds upon the hill;
Run in your pony closer and I'll tell you
The tale
Of Utah Carol, my partner, and his last
Ride on the trail.

'Mid the cactus and the thistle of Mexi-
co's fair lands,
Where the cattle roam in thousands,
A-many a herd and brand,
There is a grave with neither headstone,
Neither date nor name,—
There lies my partner in the land from
Which I came.

We rode the range together and had rode
It side by side;
I loved him as a brother, I wept when
Utah died;
We were rounding up one morning, our
Work was almost done,
When on the side the cattle started on a
Mad and fearless run.

The boss man's little daughter was hold-
ing on that side;
She rushed; the cattle saw the blanket,
They charged with maddened fear.
And little Varro, seeing the danger,
Turned her pony a-pace,
And leaning in the saddle tied the blan-
ket in its place.

In leaning, she lost her balance and fell
In front of that wild tide.
Utah's voice controlled the roundup: "Lay
still, little Varro," he cried.
His only hope was to raise her, to catch
Her at full speed,
And oft-times he had been known to
Catch the trail rope off his steed.

His pony reached the maiden with a firm
And steady bound;
Utah swung out from the saddle to catch
Her from the ground.
He swung out from the saddle, I thought
Her safe from harm,
As he swung in his saddle to raise her in
His arm.

But the cinches of his saddle had not
Been felt before,
And his back cinch snapt asunder and
He fell by the side of Varro.
He picked up the blanket and swung it
Over his head
And started across the prairie; "Lay still,
Little Varro," he said.

Well, he got the stampede turned and
Saved little Varro, his friend.
Then he turned to face the cattle and
Meet his fatal end.
His six-shooter from his pocket, from the
Scabbard he quickly drew;
He was bound to die defended as all
Young cowboys do.

His six-shooter flashed like lightning, the
Report rang loud and clear;
As the cattle rushed in and killed him he
Dropped the leading steer.
And when we broke the circle where
Utah's body lay,
With many a wound and bruise his young
Life ebbed away.

"And in some future morning," I heard
The preacher say,
"I hope we'll all meet Utah at the round-
up far away."
Then we wrapped him in a blanket sent
By his little friend,
And it was that very red blanket that
Brought him to his end.

To Sweeten Burned Lard

In reply to request of subscriber for
a way to sweeten burned lard: I had
the same experience and brought it
out perfectly by slicing about 12 pota-
toes in it and re-cooking till the pota-
toes were crisp brown. To whiten it
to natural color, slice lemon with rind
and cook in with potatoes and lard till
they are all nice and brown. Rancid
lard may be treated the same way.—
Subscriber.

Make Scorched Lard Into Soap

Replying to the Santa Rosa subscri-
ber who has the 50 pounds badly
scorched lard would advise getting 8
cans of Eagle brand lye, follow the di-
rections on the can and make the lard
into soap. You will find the home
made soap washes white clothes
whiter and colored clothes cleaner
than the soap you buy. I would divide
the lard, making a portion at a time.
—Cultivator Subscriber.

Clear With Potatoes—Make Soap

If Santa Rosa subscriber will boil
Irish potatoes, sliced, in her lard, she
will have nice sweet lard. The pota-
toes are also good to eat if drained

YOU get real satisfaction
out of a dish of Jell-O. It
gives the right touch to a
meal, just light enough and
just sweet enough.

No matter how heavily
you may have eaten, you
always feel the need of a
dessert at the end, otherwise
the meal seems incomplete.
Jell-O fills that need exactly.

Western Canada Offers Health and Wealth

and has brought contentment and happiness to thou-
sands of home seekers and their families who have
settled on her FREE homesteads or bought land at
attractive prices. They have established their own
homes and secured prosperity and independence.

In the great grain-growing sections of the prairie
provinces there is still to be had on easy terms

Fertile Land at \$15 to \$30 an Acre

—land similar to that which through many years
has yielded from 20 to 45 bushels of wheat
to the acre—oats, barley and flax also in great
abundance, while raising horses, cattle, sheep
and hogs is equally profitable. Hundreds of farm-
ers in Western Canada have raised crops in a single
season worth more than the whole cost of their
land. Healthful climate, good neighbors, churches,
schools, rural telephone, excellent markets and
shipping facilities. The climate and soil offer
inducements for almost every branch of
agriculture. The advantages for

Dairying, Mixed Farming and Stock Raising

make a tremendous appeal to industrious set-
tlers wishing to improve their circumstances.

THE AUTO-OILED AERMOTOR

A Real Self-Oiling Windmill

Oil an Aermotor once a year and it is always
oiled. Every moving part is completely and fully
oiled. A constant stream of oil flows on every
bearing. The shafts run in oil. The double gears run in
oil in a tightly enclosed gear case. Friction and wear
are practically eliminated.

Any windmill which does not have the gears running in oil is only
half oiled. A modern windmill, like a modern automobile, must have
its gears enclosed and run in oil. Dry gears, exposed to dust, wear rapidly.
Dry bearings and dry gears cause friction and loss of power. The Aermotor
pumps in the lightest breeze because it is correctly designed and well
oiled. To get everlasting windmill satisfaction, buy the Aermotor.

and salted. She can make soft soap of some of it. I use a coal oil can (top cut out): 2 gallons cold water, 1 can lye. Boil and add 5 pounds lard, stir until it ropes, take from fire and add 3 gallons boiling water, stir until smooth, let cool and if a little harder soap is wanted set in sun to dry.

I have clarified lard and also made the soap so I know both are good. Hope you can use these suggestions to advantage.—Mrs. L. B. Brown, Schilling.

HINTS FROM HOUSEKEEPERS

Plain Two Layer Cake

One heaping tablespoon shortening, 1 cup sugar, 1 egg, 1 cup milk, 1½ cups flour, 2 rounded teaspoons baking powder, pinch salt and flavoring, cream shortening and sugar, add well beaten egg and beat. Add alternately the milk and the flour into which baking powder has been sifted. Bake in two layers in moderate oven, about 20 minutes.

Lemon-Apple Filling for Cake.—2 raw tart apples grated, grated rind and juice of one lemon, 1 cup sugar, 2 eggs well beaten. Mix and cook until it thickens. Stir constantly but gently. Spread between layers and on top while warm. Over top and sides put a boiled icing.

Boiled Icing.—Boil 1 cup sugar and ½ cup water until syrup spins a thread when dropped from spoon. Pour hot syrup into beaten white of one egg. This must be done gradually. Beat until thick enough to spread on cake.—Mrs. W., Los Angeles.

A Bunch of Hints

If walnuts or any other kind of nuts are packed in layers of sand and kept in a cool place they will keep indefinitely. Soak them in warm water for an hour before breaking them open if you would have them peel as if they had just been gathered from the tree.

Box springs may be protected from insect pests by opening the ticking at one end and pouring in a quantity of naphtha balls or other insect destroyer. When the ticking is replaced no odor will escape.

Use a newspaper while pressing dark woolen goods and thus avoid troublesome lint.

Cover ironing board with a wool cloth when pressing anything that is apt to get shiny along seams.

Instead of blueing the water in which lace is to be rinsed try making a final rinsing in milk. It gives a lovely creamy tone to the lace.

A cloth dipped in ammonia will often remove the stain from the collar of a cloth coat.

A bottle or a vase is sometimes very difficult to cleanse. Try pouring in a little gasoline, add some soapsuds and shake well. The dirt will immediately disappear.

Rust may be removed from white goods with sour milk.

Apply kerosene to your stoves with a rag when you are ready to put them away for the summer; it will prevent them from rusting.

If your pastry board has become discolored it may be effectively bleached with a lemon. Cut the lemon in half and rub over the entire surface of the wood, afterward rinsing well with cold water.

TRIBUTE TO A TENDERFOOT

I once believed that "full of prunes"

Was but an idle jest

That signified an emptiness

Beneath one's hat or vest,

But since I've been abiding

In this "Land of Afternoon"

I've learned the real ingredients

That go to make a prune.

You take a little sunshine

And a little of the nectar

From the busy bee that hoards;

Add a drop of melted snowflakes

From the mountains, if you please,

And a breath of spice that's wafted

On the tropic ocean breeze,

Add a little of the treasure

That the Forty-Niner sought

And a little of the romance

With which all things here are fraught.

Wrap it all up in the purple

That the twilight hills assume,

And behold! you have the dainty

That the gods have named—A PRUNE.

—Walter Palmer.

Where there's heart room there's hearth room.

The Cultivator Patterns

3892-3571. Ladies' Costume—Slip 3571 cut in four sizes: Small, 34-36; medium, 36-40; large, 42-44; extra large, 46-48 inches bust measure. It requires three yards of 36 inch material for a medium size. Blouse 3892 cut in seven sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure, and requires 3½ yards of 40 inch material.

TWO separate patterns 10c FOR EACH pattern.

3887. Girls' Dress—Cut in four sizes: 8, 10, 12 and 14 years. A 12 year size requires 4½ yards of 32 inch material. Price 10c.

3877. Ladies' Apron Dress—Cut in four sizes: Small, 34-36; medium, 38-40; large, 42-44; extra large, 46-48 inches bust measure. A medium size requires 6½ yards of 27 inch material. Price 10c.

3723. Girls' Dress—Cut in four sizes: 4, 6, 8 and 10 years. An eight year size requires 3½ yards of 27 inch material. Price 10c.

3870. Ladies' Dress—Cut in six sizes: 34, 36, 38, 40, 42 and 44 inches bust measure. A 38 inch size requires four yards of 44 inch material. The width of the skirt at the foot is about two yards. Price 10c.

3894. Girls' Dress—Cut in four sizes: 10, 12, 14 and 16 years. A 12 year size requires 4½ yards of 42 inch material. Price 10c.

3897. Ladies' House Gown—Cut in four sizes: Small, 34-36; medium, 38-40; large, 42-44; extra large, 46-48 inches bust measure. A medium size requires 5½ yards of 36 inch material. Price 10c.

3885. Child's Romper Suit—Cut in four sizes: 2, 4, 6 and 8 years. A four year size requires 2½ yards of 32 inch material. Price 10c.

PRICE OF ANY OF THE ABOVE PATTERNS 10 CENTS EACH

HOW TO ORDER PATTERNS

Write your name and address plainly in full, give correct number and size of each pattern you want, and send 10 cents in coin or (1 or 2 cents) stamps for each number. In order to furnish our readers with the very best NEW YORK styles, all patterns ordered are filled in NEW YORK. Do not expect patterns under Two Weeks from date of order.

CATALOGUE NOTICE

Send 12c in silver or stamps for our Up To Date Spring and Summer 1922 Catalogue, containing over 500 designs of Ladies', Misses' and Children's Patterns, a concise and comprehensive article on dressmaking, also some points for the needle (illustrating 30 of the various simple stitches) all valuable to the home dressmaker. Also colored plates.

PATTERN DEPARTMENT

California Cultivator Los Angeles

February in the Ornamental Garden

Northern California

By A. R. Gould

EVEN in the ornamental garden the frost has been severe and cinerarias, arum lilies, begonias and our old friend, the every day geranium, have been hard hit, and now we must have a general clean up. Heliotropes, fuschias and hydrangeas should be now cut back and in due course will be breaking forth into a new spring growth.

Chrysanthemums Hardy

Subdivide roots of single types and plant in manured soil. There is nothing more satisfactory than these hardy perennials, and they flower late in the season when many of our summer flowers are gone. Of recent years a number of beautiful types have been developed from the single pom-poms and anemones and they come in various shades of bronze, yellow and pink while old rose is also a favorite color. Plantings may be made in groups in the border so that the colors may be effectively arranged. Plant one foot apart or if for cut flowers, in rows at least two feet apart.

Shrubs for the Wild Garden

A grouping of some of our wild shrubs will give your garden a distinct natural touch. What is more beautiful than the wild Christmas berry, heteromeles, when well covered with its bright berries? Then the prunus, or wild cherry, with its handsome dark green leaves and dark red berries should find a place in your garden as well as the madrone, arbutus menziesii and wild coffee, hamnus. The ceanothus, or wild blue lilac, is always attractive as also is the romneyi, matilija poppy. These may all be secured in small pots ready for planting. These natives are somewhat difficult to move when large and the younger plants are therefore more satisfactory. Plant in groups and place them each variety three or five in a group. They should be given plenty of room to develop, at least eight feet apart.

Flowers for Summer Bloom

As warm weather approaches a sowing of annuals may be made and the following will give a long season of bloom: Calliopsis, nemesia, larkspur, balsam, scabiosa, salpiglossis, verbena, petunia, cosmos, antirrhinum, marigold, celosia and centaurea. All these may be sown in boxes or beds in a warm situation and transplanted later to their flowering quarters. The following may be sown in borders where they are to flower: Mignonette, California poppy, Shirley poppy, oenothera, godetia and clarkia, very finely.

Summer Flowering Sweet Peas

These give a continued season of bloom and they should be sown without delay either in pots three in a pot, or boxes and transplanted, or they may be sown in trenches. They require a very deep rooting medium, hence it will always pay to dig the trench several feet deep and mix up the manure and soil very thoroughly.

Gladiolus

The early flowering types should now be showing through the ground and will require cultivating. The ground should also be well prepared for planting the summer flowering types of which there are now quite a large number of wonderful varieties in a very choice shades. A few of each of these should be in every garden.

The Water Garden

It would take more space than we have at our disposal here to fully describe the details and hints on the construction of a water garden. However, we hope that those who have the space and love for water effects will have a water garden no matter how small as even a pool eight by ten feet will be large enough to grow your favorite water lilies or water iris, and we think that there is usually a handy man around who can construct a pool of cement. And here we would warn you about making it water tight as it is essential that there should be a good thickness of cement. One can

make it of various shapes. Some prefer a round pool, some oblong and some oval, and then again others prefer it very irregular. A small fountain may be placed in one corner or in the center and an overflow pipe and clean out should not be forgotten. Next month we hope to give details of water loving plants you may grow in and around the pool.

Southern California

By Ernest Branton

EVEN to the unusually cold weather there will arise urgent need of pruning and some replanting. It is as well to defer the pruning until the actual amount of injury is ascertained through new growth, if growth is to start at all. Often shrubs and trees presumed to be dead manifest hearty vigor in springing forth abundantly. Wait for this action and prune back to first bud or branch on live wood. This involves but one pruning and enables one to prune intelligently. When pruning any plant cut out thick central growths so light may reach the interior. Also prune out canes or branches that cross and all abnormal growths.

Normally February is a month of great activity in the garden, and the present cannot prove an exception throughout its four weeks. Warm weather will come, perhaps very warm weather, and vegetation usually fairly spurts forth. The most distress-

ingly hot day the writer can recall was February 7, 1889. All deciduous trees and plants will start forth, and all contemplating planting such material should set them out as quickly as possible. Those already in the soil for one or more years will need fertilization. Sap is rising and springtime vigor needs the support of ample plant food. Soil should be stirred deeply and thoroughly.

While cold weather has necessarily delayed early February planting of material of doubtful hardiness, the last two weeks will bring sufficient warmth for all but the most tropical we grow. Seeds for autumn and winter flowers may be sown at this time in such variety that a full list can hardly be given, but the more commonly planted are: Asters, calliopsis, celosias, annual chrysanthemums, salvias, stocks, sweet peas (the last sowing) sweet Williams and other pinks. Carnation cuttings may be rooted in boxes of sand, and late in the month chrysanthemums may be treated likewise, but for all but the very warmest spots 'mums are best rooted in March. Hardy perennials, such as grow in eastern states, are already sprouting new tops, and needed division and replanting should be done at once. Hardwood cuttings of deciduous shrubs root as freely now as at any time of the year.

There are many bulbs and tuberous or fleshy rooted plants that should be planted during this month. Such should include: Agapanthus, amaryllis, anemone, caladium, calla, canna, dahlia, gladiolus, iris (except Germanica), lily, and tuberose. Tuberous-rooted begonias should not be planted in the garden but may be put in pots, under shelter, for planting out next

month. Dormant, bare root roses may still be had and should have immediate planting. Hardy plants in rooted cuttings or seedlings may be set in permanent position, as may all plants of a hardy nature, whether potted or transplanted from the open field. Evergreen plants and trees will move as easily and safely now as at any time, but should be taken up with as large balls of soil as it is economical to move. There is no better time to fertilize lawns, for now all grasses will be growing and only when growing can they assimilate food.

APPLE PULP FOR COWS

Some use has been made of apple pomace after extraction of the pectin as a succulent feed for cows. After the pectin has been extracted about three-fourths of the total weight of the pulp is water, rendering it subject to rapid spoilage. Heretofore it has been thrown away, but it has been found that when the pulp is dried it can be kept for a considerable time and, because of its reduced weight, handled and shipped economically. Some manufacturers have recently installed evaporators for drying the pulp in order to market the product for stock feed. This pulp is comparable to beet pulp in feeding value though in experiments made cows did not eat it so rapidly. It seems that pound for pound of dry matter the pectin pulp is superior to corn silage and perhaps intermediate between the silage and beet pulp. This product is also called cider press cake.

SAVED THREE COWS BY TIMELY AID

Jacob Germann of Farmingdale, Ill., tells of his experience with cow ailments much the same as hundreds of others who take the trouble to write us every year. He says:

"I had three cows this Spring, one had garget and one had milk fever, and one was done up completely from calving and could not get up or walk and I had a veterinarian with no good results. I began feeding Kow-Kare and she is able to go to pasture with the other cows now. I just know I would have lost the three if I had not had your medicine."

D. B. Thomas of Knightville, Utah, had an experience with a barren cow that is just like scores of others who have kept cows on a paying basis with the aid of Kow-Kare. He writes:

"Had a valuable Jersey cow eight years old that had had seven calves. Something went wrong with her after her last calf came, so that for two years she failed to become with calf. Fed her some of your Kow-Kare last January and she was all right the first serving, and long before I had given her the whole package of your Kow-Kare that I purchased."

For the prevention or successful treatment of Barrenness, Abortion, Retained Afterbirth, Scouring, Bunches, Milk Fever, Loss of Appetite, etc., no cow medicine has such a record of constant successes as Kow-Kare. Every cow owner should keep it on hand. Sold by general stores, feed dealers and druggists at the new reduced prices—65c and \$1.25

Winners of Cultivator Prizes in State Dairy Cow Competition

By Prof. F. W. Woll

FIVE grade cows owned by M. L. Pontoni of Arcata, had the highest average production of butterfat of similar groups in herds entered in the state dairy cow competition during the month of January, viz: 43.56 pounds, and the California Cultivator prize for that month was accordingly awarded to him. The productions of the individual grades for the month were as follows:

Name of Cows	Days in Milk	Milk Lbs.	Butter Fat Per cent	Lbs.
Klamath	281	795	7.3	58.04
Mousie	289	781	5.4	42.17
Arcata Girl	278	601	6.8	40.87
White Tail	280	630	6.3	39.69
Rolley	251	756	5.2	37.04
Average	276	712.6	6.11	43.56

All these cows were grade Jerseys and were full aged, with the exception of White Tail, a four year old. All were far advanced in their lactations, on the average over nine months, and their production of 37 to 58 pounds of butterfat for the month at this stage is therefore remarkable, especially in view of the fact that all were bred within a few months from last calving. The average production of milk by the grades for the month was 712.6 pounds, with an average fat content of 6.11%.

These cows stood first among similar groups of five grades in seven herds in different parts of the state competing for the Cultivator prize the past month, all of which were nearly dry and had a low production, viz: 11.4 to 19.3 pounds of fat for the month.

The state dairy cow competition came to a close on January 31, and this is therefore the last award of the California Cultivator monthly prize. During the 17 months of the competition it was won by 11 different dairy farmers, seven of whom were located in Humboldt County, three in Los Angeles County, and one in San Joaquin County. The names of the winners are: Earl Graham, Compton, four times (for four different groups of five grades each); Los Angeles County Farm, Hondo, Nate Hauck Alton, and Eugene Biondini, Ferndale,

each twice; C. F. Holman, Stockton; F. F. Pellissier, Whittier; J. A. Genzoli, Loleta; W. Terkelsen, Ferndale; W. F. Early, Grizzly Bluff; Peter Iverson, Grizzly Bluff, and M. L. Pontoni, Arcata, each once.

The average production of these 85 prize winning grades for the month was 1,439.7 pounds milk and 67.65 pounds butterfat, the highest production of butterfat being 113.3 pounds and the lowest 40.2 pounds (average distance from freshening 97 days). A production of 67.65 pounds of butter fat is equivalent to nearly 80 pounds of commercial butter, or over two and one-half pounds per day, a yield that would be a credit to any purebred herd.

In offering this monthly prize for high producing grades the Cultivator has rendered a distinct service to the dairy industry of the state and helped to stimulate a greater interest in the competition among dairy farmers and breeders during its progress than any other single feature connected with it. It has been the means of calling attention to the excellent work done by many previously unknown dairy farmers along the lines of breeding and production and has shown that no one breed has a monopoly of good cows. Much good has, and doubtless will come from the educational influence of this and other features of the competition in the communities of the respective prize winners and in the wider sphere where the results have been studied and discussed through the reports that have been published from month to month since the competition started.

Dairy farmers and breeders are cordially invited to attend the closing exercises of the competition on February 23 at 7:30 p.m., during the Stockmen's Week at the university farm, Davis, when announcement of the award of all prizes in the competition will be made and the presentation of trophies and other prizes will take place. An excellent program has been arranged, with addresses and discussions by well known dairy specialists. Those attending may look forward to most interesting and profitable meetings.

1921 Livestock Values Show Heavy Deflation

THE income of the livestock producers of the United States derived from meat animals marketed through central markets during 1921 was approximately \$1,968,231,000, compared with \$2,913,398,000 similarly received during 1920, a total shrinkage in income of \$945,167,000. To this shrinkage in value of livestock marketed cattlemen contributed about \$447,624,000, hogmen \$460,464,000, and sheepmen \$37,079,000. It should be added, however, that the above figures represent comparative central market values of livestock and do not take into account marketing charges which the producer must always pay.

These figures do not represent paper losses or a marking down of inventories which might be at least partially neutralized by subsequent advances in market prices. On the contrary, they represent approximately the amounts by which the income of the American farmer was reduced during the past year as a result of his livestock marketing operations.

This reduction of income was brought about by two sets of conditions, namely, sharp declines in market prices of all classes and grades of meat animals and a decrease in the total number of animals marketed.

Using yearly average prices at Chicago for 1920 and 1921 as a basis of comparison, price declines for 1921 ranged from \$5.68 on hogs to \$4.33 on sheep, all per 100 pounds. Lambs declined \$5.66 and beef cattle \$5.32 during the same period. These figures represent only the net changes in average annual prices for the two years and do not necessarily measure extreme fluctuations within the years. The other important factor which

cut into the farmer's income was the fact that there were nearly 3,000,000 fewer meat animals marketed in 1921 than during the preceding year. In this connection it might be argued, however, that when farmers are marketing at a loss the fewer the animals marketed, the better for the farmer. From the standpoint of domestic meat supplies of the near future perhaps a more significant feature is the fact that during the year just ended 2,900,000 fewer animals from central markets went back to the country for feeding than during 1920.

In the following discussion Chicago weekly average prices, either of bulk of sales or selected typical classes and grades of animals, are considered as an index of the general trend of the market throughout the country.

Cattle

Of the various classes of livestock, cattle probably presented more interesting features than did any other. For example, despite a total decrease of 11 per cent in the number of head marketed, prices declined steadily throughout the year 1921. It was rather significant that the highest weekly average price of the year occurred during the first week of January and the lowest price during the week ending December 24. While certain slight advances occurred at various times during the year they were almost invariably of short duration.

Not only was the 1921 yearly average price \$5.32 under that of 1920 but it was only 63 cents above the prewar average for the five years 1910-1914. During the first week in May the price fell to within 11 cents of the prewar average and during the first week of July it fell four cents below

Infection

would have been prevented if B-K had been used shortly after this cow dropped that beautiful calf. When cows do not clean properly after calving, it indicates a germ infection which is likely to run through the entire herd and result in Abortion and failure to "get with calf." The afterbirth should be removed at once, without force, and the cow flushed out with a powerful antiseptic.

B-K is scientifically correct for this work. It quickly dissolves the adhesions and slimy matter and brings the afterbirth, kills the germs and foul odors, stops the discharge and straining. B-K is non-poisonous, healing and soothing.

If your dealer does not have B-K send us his name. Get a gallon—the standard farm package, FREE "trial offer" and bulletins on contagious abortion—calf scours—hog raising.

B-K—in one bottle—helps you keep all these diseases out of your herd—and prevents big cash losses.

BULL BARGAINS

We offer a limited number of high record registered Holstein bulls of excellent type and popular breeding. They are

—Ready for heavy service.

—Out of dams with 700 to over 1,000 pounds butter in one year.

—By sires whose dams have yearly records up to 31,000 and 33,000 pounds milk and up to 1,200 and over 1,300 pounds butter.

There are only a few on hand and at the prices we have placed on them they will soon be gone. If you can't visit our herd, write or wire for description and prices.

that average. From that time on, the 1921 average hovered close to that of the pre-war period, sometimes touching the latter and at other times only slightly above it, until the third week in November, when it fell below the pre-war average and remained so to the end of the year.

Opinions may differ as to what the above situation indicates with regard to the cattle industry of the country. There seems to be little doubt, however, that range herds have been seriously depleted and that the large cattle producers will, for some time to come, face a serious problem of restocking.

Serious inroads on the great breeding herds in Texas, which occurred during recent drouth years and which were followed almost immediately by severe and sustained liquidation made necessary by financial conditions, were largely responsible for a shrinkage of approximately 57 per cent in 1921 cattle receipts at the Fort Worth market as compared with receipts at the same market during 1918. A shortage of cattle in the great Northwest was indicated by the decreased arrivals at such markets as Chicago, St. Paul, Omaha and Sioux City.

Shrinkage in importations of Canadian cattle, due partially to the tariff duty imposed, was an additional factor which contributed to decreased receipts at some of the markets located near the international boundary. In fact, it was not until late in the season, when financial relief materially broadened the demand for stocker and feeder cattle, that any appreciable number of Canadian cattle were imported.

There was little activity in stocker or feeder trade until late in the summer, when assurance of an abundance of cheap feed, easier money, and a growing conviction that cattle prices had about struck bottom broadened the investment demand. As a matter of fact, subsequent events demonstrated that the opinion regarding prices was not well founded.

Following the trend of market requirements for lighter carcass beef, stocker and feeder demand switched strongly from heavy feeders to light cattle and even calves, with the result that an unusually large percentage of calves and many light, and often common stockers went back to the country.

Indicative partly of the growth of the dairy industry, but to a considerable extent signifying liquidation of beef herds, calf receipts were approximately 2.5 per cent greater than during 1920, despite a shrinkage of 11 per cent in receipts of cattle.

Hogs

Hog prices during 1921 followed a course, in most essential respects, paralleling that of cattle prices. The yearly average for 1921 was \$5.68 under that of 1920 and was 64 cents per 100 pounds above the pre-war average for the five years 1910-1914.

During the third week of April, 1921, prices dropped to within three cents of the pre-war average and during the first week of May to within one cent of that average. Early in June prices dropped slightly below the pre-war average and hovered around that point for nearly a month, but fairly sharp advances which culminated during the first week of August were followed by a rather precipitous decline which, by the first week of September, brought the price back to and below the pre-war average. From that time to and including the week ended December 24 the price remained below the prewar average.

Average hog prices reached the highest point during the second week of March, when the average of bulk of sales at Chicago was \$10.50 per 100 pounds. The lowest point of the year was reached during the third week of November, when the average price was \$6.76. Despite the fact that an abundance of relatively cheap corn was available during most of the year, the average weight of hogs at Chicago during 1921 was three pounds less than for 1920.

The preference for lightweight animals applied to hogs as well as cattle and as a result lightweight hogs and pigs sold at a premium practically throughout the year. At one period in August lightweights on the Chicago market sold \$3.50 per 100 pounds

above heavy packing sows.

While total receipts of hogs at all markets for 1921 were only 2.6 per cent less than during 1920, variations in production and marketing were not evenly distributed throughout the country. There was, for example, a rather marked shortage of hogs on the Pacific coast which resulted in considerable numbers being shipped from Kansas City to California points, and from the more northern markets to the Pacific Northwest. Increased losses of hogs from disease undoubtedly were largely responsible for curtailed marketing from certain sections.

Sheep

The sheep and lamb market during 1921 was, to a certain extent, a law unto itself. This was particularly true of lambs. While the yearly average of prices for 1921 was \$5.66 lower per 100 pounds than the 1920 price, the lamb market during a greater part of the year showed strong powers of recuperation, and after the middle of February every decline was followed by a fairly sharp advance. After the low point reached late in August, the market advanced rather steadily to the end of the year and prices for the week ending December 24 were only \$1 under those of the first week of the year.

The sharp decline which occurred during the first six weeks of 1921 constituted a continuation of the steady downward movement which began at the close of January, 1920, when the weekly average price at Chicago reached the high point of \$20.80 per 100 pounds and culminated during the third week of February, 1921, when prices touched \$8.13. When that great general movement finally came to an end the market resisted strongly and successfully any further efforts toward sustained depression.

The lamb market differed from that of cattle and hogs in that at no time did lamb prices touch the pre-war average. The yearly average price for 1921, while \$5.66 under that of 1920, was still \$2.62 over the pre-war average for the five years 1910-1914 in spite of the fact that receipts of sheep and lambs at all markets during 1921 were approximately 629,000 head greater than during 1920.

While sheep prices showed a similar resistance to depressing influences and followed the same relatively steady trend as did lamb prices, they differed from the latter in that the great downward swing which began early in 1920 and culminated near the close of that year carried sheep prices below the pre-war average during the last week of 1920. Throughout 1921 sheep prices fluctuated very close to the pre-war average, being below that average about as much of the time as above. The yearly average price of mature sheep for 1921 was \$4.33 per 100 pounds lower than that of 1920 and was only 12 cents above the average of the five pre-war years.

While the continued heavy receipts of sheep and lambs at public stockyards throughout the year 1921 would seem to indicate a continuation of liquidation, the sharp upturn of lamb prices during the last six weeks of 1921 may carry to the sheepman a ray of hope of better times to follow. That there is an increasing demand on the part of the consuming public for lamb as food seems indisputable and this would seem to be borne out conclusively by the fact that despite the general industrial depression of recent months and the relatively high price at which lamb sells compared with most other fresh meats, together with increased supplies available, lamb prices have been maintained well above the pre-war level.

SHORT COURSE DAIRY MEETINGS

Short course dairy meetings were held the past two weeks in Imperial, San Diego, Orange, Riverside, San Bernardino and Los Angeles Counties. Drs. Frey and Keefe of the state department of agriculture, Prof. Castle of the U. S. department and Secretary-Manager Greene of the California Dairy Council were the speakers. It is planned to hold these meetings annually.

As Simple as A.B.C.

In principle, construction and operation the De Laval Milker is as simple as A. B. C.

Nothing could be more logical or simpler than the way it works—in complete harmony with the cow and in full observance of the principles of milk secretion.

Think of the most skilful hand milker you know—one who has the knack of getting more milk out of cows than any other—and you will get an excellent idea of how it works; with this difference—that it enables one man to milk from two to three times as many cows, never gets tired, and is as regular and uniform in its action as the tick of a clock. Every unit, no matter if there are a dozen, always works at exactly the same speed. Naturally with such milking cows do better and their udders are kept in much better condition.

In construction it is extremely simple. There are no adjustments to make, no complicated parts to get out of order. For instance, the pulsator has only

one moving part and never requires oiling. The entire outfit is thoroughly reliable.

Because the De Laval Milker is designed right and properly constructed, it is easy to operate. Any one can soon learn to operate it perfectly; even young boys and girls. It is practically fool-proof.

And of great importance—it is easy to wash and keep clean, so that milk of the finest quality can be produced.

On thousands of farms, De Laval Milkers are giving complete satisfaction and are making dairying more pleasant and profitable for their owners.

Sold on easy terms and pays for itself in less than a year. Send for complete information.

HOLSTEIN *Fred Hartsock* **CATTLE**

We have assembled an excellent foundation herd of females and will be glad to have breeders call. Fred Hartsock, Lankershim, California.

Condition of the Cattle Industry in the Ranch Country

From Address of Fred H. Bixby, President, American National Livestock Association

THE conditions are most deplorable, the reasons being, first, high cost of production and the high cost of marketing. This resolves itself into the high salaries, high prices of feed, high cost of materials and excessive freight rates, to say nothing of too high commission charges at the central markets.

Second, in some of the western states we have dry years, and a number of states were subjected to blizzards and exceptionally bad weather conditions.

Third, the decrease in consumption caused: first, by the inauguration of the meatless days during the war; second, by the high retail price; third,

by the propaganda of other industries against our commodity.

Fourth, lack of export trade. There is no export trade and there isn't much chance that there is going to be in the immediate future.

Fifth, the period during the war was "open season" for the cattle loan companies. They loaned a great amount of money on too high a valuation and in some cases on a very poor appraisal, consequently when the drop came these loans were called, and the forced liquidation following resulted in flooding the markets in many cases with half fat cattle instead of prime cattle.

Sixth, there was no money available for the financing of feeders or for the financing of the people purchasing the yearlings and feeder cattle, the psychology of it being absolute depression and lack of confidence among the cattle producers of the west.

My opinion of the remedies for the present situation would be, first, a reduction in the overhead which we have partially accomplished.

Second, the season in the west is apparently going to be an exceptional one and the spirit of the cattlemen will be revived.

Third, the insistence by the producers that the retailers curtail their profit, as it is a certainty that they are the profiteers in the meat business, or that they are handling their end of the business in an uneconomical manner with the result that meat consumption decreases.

In our endeavor to "put over" this plan of an increase in the consumption of our commodity we are forming a committee consisting of producers, packers, commission men, and retail men to start in the immediate future an "Eat More Meat" campaign.

Fourth, the War Finance Corporation has come to our assistance in a wonderful manner. The cattle breeders, or cattle producers, are enabled to produce money at seven and one-half per cent for a term of three years. It is the opinion of the cattle producers that the term is too short and perhaps the interest paid slightly excessive. Our business should be able to borrow money at the same rate as any other industry.

Fifth, there has been a slight reduction in freight rates, but it is

impossible for an industry to receive less than pre-war prices for its commodity and pay double the transportation charges it paid before the war. We are vitally opposed to what is known as the "guarantee clause" of the railroad companies.

Sixth, relative to the attitude of the commission men at the central markets who have been requested to reduce their commission charges in accordance with the prices which the producers now are receiving at the markets for their cattle, we are insisting that these commission charges be commensurate with the pre-war prices that we are getting for our

announced by Professor Woll and the prizes presented by Professor Gordon H. True.

Friday morning at 10:00 a.m. the men who won prizes in the dairy cow competition will tell how their cows were fed and handled. Following this Noel Negley, formerly cow testing association specialist of the U. S. dairy division, who is operating a dairy farm in California at the present time, will talk on "How to Use a Cow Testing Association." J. W. Coppini, one of the leading Jersey cattle breeders in the state, will use as his subject, "A Pure Bred Dairy Sire at the Head of Every Herd." A dis-

Won Over Five Other Colleges

Winners of "Cattle Loan Trophy" at Portland. These are all but one California boys and represented U. C. They are, reading from left to right, standing: J. M. Rutherford, Santa Barbara, (alternate); Chas. A. Reeves, Pomona; Albert H. Powers, Marshfield, Oregon; Clarke J. Burnham, Berkeley; Philip J. Webster, San Diego. Sitting: Sam Bell, Whittier; E. H. Hughes, University Farm, Davis, (coach).

cattle. We are insisting that the commission firms go back to their regular pre-war schedule and instead of opposing the recently enacted legislation known as the "Haugen Bill," that they come in with us, and with the packers, to the end that we will carry out this legislation successfully and justly to all concerned and be of the proper assistance to our secretary of agriculture.

Seventh, we are very much in favor of the cooperative commission houses now in existence in some cases at the central markets. We are in favor of having more of such commission houses started.

The cattle producers in the west are unalterably opposed to the transfer of the forest service from the department of agriculture to the department of the interior. We have the greatest confidence in Secretary Wallace and hope that when the time comes for federal leasing of the unappropriated public domain it will be handled as well as the bureau of forestry has been handled.

DAIRYING EMPHASIZED DURING STOCKMEN'S WEEK

The dairymen will be given two days and one night for their program during Stockmen's Week at the university farm, Davis, February 20-24.

Starting at 11:00 a.m. Thursday, February 23, a preliminary report of "Feeding Sunflower Silage to Dairy Cows" will be given at the dairy barn, where an experiment is in progress to study the value of sunflower silage as compared with corn silage as a feed for dairy cows.

The afternoon will be taken up with meetings of the dairy cattle breed associations. These meetings commence at 1:00 o'clock. The California Jersey Breeders' Association, California Guernsey Breeders' Association and California Ayrshire Breeders' Association have requested that this time be set for their meetings.

A well balanced program is announced for Thursday evening. B. H. Rawl, former chief of the dairy division, bureau of animal husbandry, U. S. D. A., now with the California Central Creameries, will discuss "Ways and Means of Increasing Dairy Production." S. H. Greene, secretary of the California Dairy Council, will outline "A Simple Program of Progress for the Dairy Industry of California." The results of the "Second California State Dairy Cow Competition" will be

cussion will be led by Professor C. W. Rubel, of the extension division of the University of California. Professor Woll will explain the state register of production for grade cows. Dr. G. H. Hart of the veterinary division, University of California, will discuss "Contagious Abortion in Dairy Cattle."

Immediately after lunch at 1:30 p.m. a sale of pure bred dairy bulls will be held. It is hoped that the dairymen will arrive at the university farm in time for the California stockmen's banquet at 6:45 Wednesday evening, February 22.

LIVESTOCK NOTES

The condition of livestock, pastures and all growing crops has been adversely affected by the unseasonably cold weather of the last two weeks of January. Freezing temperatures occurred January 19 in Northern California, extending throughout the state, January 20, 21 and 22, and resulting in the heaviest damage in the southern citrus districts that has been experienced since 1913. Moderately heavy rains fell in southern California January 29-30, and light rain and snow in central and northern California. Farm work as a rule is light with a supply of farm labor reported sufficient.

Reports on pastures all reflect a retardation of growth due to the cold weather, but the supply of grass appears to be sufficient except in some of the higher valleys, where pastures are snow covered. Livestock generally is apparently not in quite so good condition as at the beginning of the month. Lambing for the state is reported to be about one-half completed, and while conditions during the past two weeks have been generally unfavorable, no serious damage to the lamb crop has been reported.—E. E. Kaufman, Agricultural Statistician.

MOUNTAIN HOUSE CENTER ACTIVE

On Thursday, January 26, Farm Advisor Russell T. Robinson and Dr. Robert Jay, swine expert, U. S. bureau of animal industry, gave a demonstration in the use of serum for the prevention of hog cholera. It was well attended by an interested group of ranchers of the Mountain House section.

In the evening Mountain House Center of the Alameda County farm

HEREFORD BULLS IN CARLOAD LOTS At Public Auction

Tuesday, February 21, at 1 P.M.
University Farm, Davis, Calif.

This sale affords the first opportunity in California for buyers of range bulls to buy them in groups suitable for the carload buyer.

There will also be at least 20 bulls sold individually, to take care of the buyer who wants only one or a few head.

There will also be about 25 cows and heifers of good breeding for the man who wants to increase his she stuff.

Every Animal Registered,
Transferred Free of Charge,
Guaranteed a Breeder, and
Tuberculin Tested.

Ayrshire Cattle **OG RANCH** Buellton, California

Twenty head of high grade Ayrshire heifers bred to pure bred bull.
Ten head of high grade cows, seven-eighths or better. Good milkers.
For sale at reasonable prices. Apply C. G. Lamb, Supt.

bureau met with an attendance of about 30. A committee was appointed to look after the marketing of alfalfa and grain hay from this region. It is the intention to connect with dairy-men in this and Contra Costa Counties and sell direct to them either in truck-load or carload lots.

A committee made up of men residing in the district a number of years will advise with prospective settlers regarding land values, the idea being to acquaint them with the producing value of the land. It is hoped in this way they can eliminate the practice of selling land at a figure such as can only result in bankruptcy and deserted farms, for men with limited means.

BERYLWOOD HERD GETS COAST'S HIGHEST RECORD HOLSTEIN BULL

One of the most notable transactions ever negotiated in Holstein circles was closed February 4 when J. W. Snodgrass, acting for the Berylwood Stock Farm, Hueneme, purchased from the A. W. Morris and Sons Corporation, Woodland, the 15-month old son of Sir Aaggie De Kol Acme and Aralia De Kol Mead 2d. The purchase price has not been made public but is known to have reached five figures.

In the selection of this young bull the Berylwood Stock Farm has the distinction of owning the highest record Holstein bull on the Pacific Coast and it is confidently expected that when his dam completes her year's record that he will take the first rank among the bulls of the breed. As noted, the sire of Prince Aaggie of Berylwood, the name selected by Mr. Snodgrass, is Sir Aaggie De Kol Acme son of the famous Aaggie Acme of Riverside 2d, whose strictly official yearly record of 1,331.70 pounds of butter is a world record. His dam, Aralia De Kol Mead 2d, a daughter of Aralia De Kol Mead, promises to

take high rank among the leading producers in Morris' great herd. As a junior two year old she hung up a 365 day record of 851.01 pounds butter and 18,785.16 pounds milk; as a four-year-old she came through with 886.16 pounds butter and 21,217.2 pounds milk in 305 days. After freshening last December, at which time she gave birth to twin heifer calves, she made 36.53 pounds butter and later increased her seven-day record to 37.12 pounds butter from 563.7 pounds milk. It is expected that she will finish her year with more than 1,000 pounds butter.

A study of the pedigree of Prince Aaggie of Berylwood discloses the fact that his seven nearest dams average slightly over 1,120 pounds butter, a higher average production than is credited to any Pacific Coast bull and which is only exceeded by his 100 per cent brother, Sir Aaggie Mead De Kol, sold by the Morris' to Arfmann and Amos of New York for \$11,000.

Another fact of impressive interest is that five of his seven nearest dams have proven their transmitting qualities by producing 1,000 pound daughters. The sixth dam has an 885 pound four year old daughter that has 954 pounds to her credit as a mature cow. The seventh dam, his own, is too young to have acquired producing daughters but as she has three daughters under milking age it is certain that she will be able to boast of at least one 1,000 pound daughter. Furthermore, five of the seven dams have each produced over 2,000 pounds of butter in two consecutive years and the sixth one has 1,862.88 pounds in two years.

In speaking of this sensational youngster, Frank Morris pointed out that he believed that there were not over eight instances of three generations of thousand pound dams and that when Aralia De Kol Mead 2d completes her year that three cases will appear in his pedigree. Besides being a 100% brother to Sir Aaggie De Kol Mead, Prince Aaggie of Berylwood claims a three-quarter relationship to King Korndyke Pontiac Acme, the \$41,000 bull at the head of the Santa Anita herd, and a like relationship to the \$9,250 Sir Aaggie Mead owned jointly by W. J. Higdon and F. S. Borrer of Tulare. The dam is a full sister to Aralia De Kol Pontiac Mead that has just completed a yearly record of 1,065.43 pounds butter.

By the purchase of this crack bull Mr. Snodgrass has at once placed the Berylwood herd in the front rank of California Holstein establishments. Few bulls have ever entered a herd under more favorable circumstances as the Berylwood herd has around 70 head of well bred females waiting for his immediate services. California breeders will watch this herd with the keenest interest and many are already predicting that with such a richly bred bull in service that the results can be looked forward to with complete confidence.

Southern California is particularly fortunate in having added to the already formidable list of high record sires in service this great youngster, and breeders in that section now have available what is undoubtedly the greatest lot of high record bulls owned in any one section of the world. Not the least interesting fact in connection with this transaction is the announcement of Mr. Snodgrass that the services of Prince Aaggie of Berylwood will be available to the members of the Ventura calf club that he was instrumental in organizing and which is being carried on largely under his direction. It is entirely correct to say that no calf club in America has the advantage of such breeding.

For the past several months Prince Aaggie of Berylwood has been used in the herd maintained at the university farm, Davis, and a number of the institution's best cows are safely settled to his service.

80 SHORTHORNS CATALOGUED FOR SALE

Entries for the annual sale to be held at Davis during Stockmen's Week at the university farm have been closed by the California Shorthorn Association. The sale will be on Wednesday, February 22. Among the entries are several of the prize winners in the bigger shows of last fall's circuit.

Howard Vaughn of Dixon, sales manager for the association, writes regarding the sale as follows:

"The bulls are all between the ages of 11 and 30 months. There are no old stale bulls and only a very few that are not old enough for immediate and heavy service. Some of these bulls are as well bred as any Shorthorns in the United States, and are in condition to appeal to men who want high class herd sires. There are a number in the sale that are from good sires and dams but have not been highly fitted and are in excellent condition to turn on the range. There will be eight groups of bulls of from three to five head each which will be sold together, so that range men may be better assured of getting the number they may want.

"In making the arrangements for this sale we have been very much surprised to find how few really good purebred bulls there are for sale in California this spring. The officers of the association thought they would have 150 to 200 bulls offered for sale. We have found, however, that there are actually not over 100 head of purebred Shorthorn bulls of serviceable age on the market now, and two-thirds of them have been consigned to the association sale to be held in Davis.

"This condition of affairs indicates two things: First, that those men who desire to purchase purebred bulls this year will find it almost imperative as well as exceedingly profitable to attend the Davis sale; and, second, that the limited supply of purebred bulls indicates a great opportunity for the starting of new herds of purebred cows to produce a good class of bulls to supply the inevitably increasing demand in the near future."

Berkshires

February 27-28, American Berkshire Congress Show and Sale, Riverside.

Roma Duchess Korndyke Alcartra, owned by the J. S. Gibson Company, Williams, recently completed a seven day record of 31.15 pounds butter in seven days. She is by Prince Alcartra Korndyke, the oldest son of Tilly Alcartra.

C. S. Howard, Willits, owner of the Ridgewood Ranch, reports a sale of six Herefords to Wm. G. Henshaw, Eden Valley.

The California Cattlemen's Association is preparing for an intensive campaign for membership. Secretary Robert will have charge of the drive in the southern part of the state.

Mais Brothers of Long Beach, Los Angeles County, announce that their recently formed Glen Ivy Holstein herd is not yet an exceptionally large one but promises to be great in accomplishment because of fine foundation stock.

L. W. Bardsley, Tulare, will disperse his entire herd of registered Holsteins on March 14, on account of pressure of other business and the large share of his time taken by his duties as a supervisor of Tulare County. While no official testing has been done in the herd it is a group of good producers and is headed by an excellent yearly record son of King Mead of Riverside.

W. J. Higdon, Tulare, celebrated his return to milking his own test cows by making a 31.40 pounds seven day record on the senior three year old Johanna Gelsche Walker, a daughter of Prince Gelsche Walker, with a milk yield of 504.9 pounds. It may be remembered that Mr. Higdon purchased this heifer in the C. W. Anderson sale at Burbank in June, 1920. The daughters of King Korndyke Pon-

tac 20th are coming on in excellent shape, but none of them are to be crowded on seven day test and will be given 305 or 365 day records.

Germain's FIELD SEEDS GROW in California

Why?

—because no strain is offered for sale

until it has been thoroughly tested and tried out under California growing conditions.

We make a specialty of fancy, re-cleaned, purebred, high-germination, true-to-type field seeds. A half century of intensive specialization is back of every pound you buy.

Red Top GUARANTEED Steel Fence Posts

YES, there can be improvements even in fence posts! You don't have to break your back digging post holes these days; get RED TOPS—they drive like a stake.

But that isn't all; they don't burn, rot or buckle; they make a strong fence line that lasts for years. They hold the staples. Practically eliminate repairs and upkeep.

And they actually cost less in the fence line than wood or concrete posts. Made in angles and tees.

DEALERS EVERYWHERE

NOWHERE is the need for reducing the cost of production more urgent than in the case of the great staple crops *Corn, Grain, Hay*. These have always been low value per acre crops. Their labor cost factor is high. A double yield per acre involves but little additional labor.

Fertilizers are the direct means to increase yield. For the best results, fertilizers must be properly balanced.

One-sided fertilization spells soil exhaustion. Balance the fertilizer with 5 to 10 per cent. of Potash. There is plenty of it now.

POTASH PAYS

The farmer's best friends

When there's wheat to be harvested, when there's hay to cut, when oats are ripe, and corn and potatoes must be cultivated, Planet Jr. cultivators are the farmer's best friends. Planet Jr. cultivators are scientifically designed to work fast and clean with minimum effort. Time saved cultivating is labor and money saved. Planet Jr. saves them all.

Planet Jr.

No. 8 Planet Jr. Horse Hoe and Cultivator is one of the most useful, popular horse hoes we make. Its extra length and stiff construction give it steadiness. Works quick and close, saving hand work. Adjustable to all widths. Hills or throws from the row. Has solid, non-clogging depth wheel with lever.

Directions for Making Alum Tanned Lace Leather

THESE directions for making alum tanned lace leather are issued by bureau of chemistry, United States department of agriculture, in response to numerous requests from farmers for information that will help them utilize their hides, since they are offered for them but half as much as before the war and are charged double pre-war prices for leather. Directions for making other kinds of leather are in preparation but not yet available.

These directions have been drawn with care to adapt them to the farmer's facilities and on the assumption that he is inexperienced in tanning.

Study and understand the directions, have ready all supplies and equipment called for, and have your plans made before starting. Follow directions carefully and if you find that you do not thoroughly understand any part, or if you have trouble working the directions, or if you make a poor leather, write to the bureau of chemistry telling at what stage you had difficulty, stating fully just what the difficulty was, and send also a piece of the leather.

Lace leather should be made from good, sound hides, preferably steer hides. The weight of the hides used may vary from 20 to 40 pounds, depending upon the thickness of leather desired.

Hides must never be allowed to freeze, nor heat. Tanning operations, unless otherwise specified, should be carried out at a fairly uniform temperature. A cellar where the solutions can be kept fairly warm in winter and cool in summer is a suitable place.

Slaking Lime

Place about six pounds of burnt or caustic lime in a clean wooden tub; add about a quart of water, and as the lime begins to slake, add more water, a little at a time, to keep the lime moist, but do not pour in water enough to quench the slaking. After the lime is apparently slaked, stir in a gallon or two of clean water. Do all this just exactly as you would make whitewash. Slake the lime the day the soaking is started, and keep the tub covered until used. If burned lime is not available fresh hydrated lime (not air slaked) may be used. In this case stir eight pounds of hydrated lime into a barrel of water and proceed as directed under liming.

Soaking and Cleaning

If the hide has been salted, shake thoroughly. Spread the hide out hair side down, cut off the tail, and trim off the head, ears and ragged shanks and edges.

Place the hide, hair side up and lengthwise on a log or board and with a sharp butcher knife cut it from nose to tail down the backbone into two "sides." It will be found more convenient in subsequent handling, when the hide is large, to split each side lengthwise into two strips. The back strip will make the better leather and should be about twice as wide as the belly strip.

Fill a barrel with clean, cool water. Place the strips in the barrel and soak for two or three hours, with frequent stirring to soften the sides and loosen and soak out the blood, dirt, manure and salt. Take the strips out of the barrel and place one at a time, hair side up, on a very smooth slab, log, or a thick planed board, from one to two feet wide and six to eight feet long, one end of which rests on the floor and the other extends over a box or trestle about two and a half feet high. Scrub off all dirt and manure and wash off with several buckets of clean water.

Turn the strip over, flesh side up, and carefully cut off most of the meat or flesh. Now go over the entire flesh side with the back edge of a drawing or butcher knife, holding the knife by both ends, pushing it away from you hard against the strip, and wash off with a bucket or two of clean water. This working over should always be done. Refill the barrel with clean, cool water, put the strips back, pull up and stir frequently until they are soft and flexible. A green hide usually should not remain in the water more than from 10 to 20 hours,

and a green salted hide not more than 20 to 40 hours.

When the strips are properly softened throw them over the slab or board and carefully scrape off all remaining flesh or meat with the back edge of the drawing or butcher knife. It is of the greatest importance to remove all of this meat. When it can not be scraped off, cut it off, but be very careful not to cut into the hide itself. Even though there appears to be no flesh to take off and nothing appears to be removed, it is necessary to thoroughly work over the flesh side in this way with the back edge of the knife. Finally wash off with a bucket of clean water.

Liming

Empty and rinse the barrel in which the soaking was done, pour in the slaked lime, and nearly fill the barrel with clean, cool water, and stir thoroughly. Hang each strip, hair side up, over a separate piece of rope, and suspend in the lime water. Fasten the ends of the ropes to the barrel so that the strips are entirely covered by the lime water, and cover the barrel with a bag or board. Pull up the strips and stir the lime three or four times each day until the hair will rub off easily from all parts of each strip. This will take from five to eight days in summer and from six to 16 days in winter.

When the hair comes off easily throw the strips, hair side up, over the smooth slanted slab or board, and with the back of a drawing or butcher knife, held nearly flat against the hide, push the hair off. If the hide is sufficiently limed, a curdy or cheesy layer of skin rubs off with the hair. If this layer does not thus rub off, the strips must be returned to the lime water. After removing the hair, put the strips back in the lime for another day or until any fine hairs that may remain can be easily rubbed off. Work over the grain or hair side thoroughly with the back of the knife to "scud" out as much as possible lime, fat or dirt. Turn the strip over and do the same thing, making sure to remove any meat that may be yet on the hide. Then throw the strips into a wooden or fiber tub of clean, lukewarm water and let remain for from six to eight hours, stirring occasionally.

Drenching

Drenching is necessary to remove the lime which the hide still contains and to get it very soft and pliable.

Buy three ounces of U. S. P. lactic acid at the drug store. Nearly fill a clean barrel with clean cool water and stir the three ounces of lactic acid into it with a clean paddle. Take the strips out of the tub of water, throw them into the barrel of acid, and pull up and stir frequently for 10 to 12 hours or over night. Now work over or "scud" thoroughly both sides of each strip as is directed after liming, and put in a tub of cool clean water.

Lactic acid helps to make a softer leather but if it cannot be bought, use half a gallon of vinegar instead.

Tanning

While the strips are being drenched, thoroughly wash out the barrel in which the hide was limed. Place in it 15 gallons of clean water and 12 pounds of ammonia alum, or potash alum, and stir frequently until it is all dissolved.

Dissolve three pounds of washing soda (crystallized sodium carbonate) and six pounds of salt in five gallons of cold clean water in a wooden bucket. The soda crystals must be clean and transparent (glass like). Do not use white opaque lumps.

Now pour the soda solution into the alum solution in the barrel very, very slowly, stirring the solution in the barrel constantly. Take at least 10 minutes to pour in the soda solution in a small stream. If the soda is poured in rapidly, the solution will become milky, and it will not tan. The solution should be cool, and enough water should be added to nearly fill the barrel.

Hang each well washed strip, from the drench, in the alum-soda solution. Pull up the strips, and stir the solution six to eight times each day. (Do not put the bare hands in the liquor

if they are cut, cracked or have sores on them. The alum will make them worse.)

After six or seven days remove the strips from the alum-soda solution and rinse well for about 15 minutes in clean cold water. Drain on clean boards for half an hour, then hang up by one edge to dry in a moderately warm place free from drafts. Turn the strips every hour so that first one edge and then the other is up. If this is not done the lower edge may become cracky. Be sure not to let the strips dry completely and become stiff. If one part of the strip dries faster than another, which is especially likely to occur on the edges, moisten these drier places with water. While the strips are yet damp but have become somewhat stiff, about like a bridle or driving rein, but can be sharply bent without cracking, begin to work or "stake" them. That is, pull them vigorously back and forth lengthwise over the end of a small smooth board about two and a half feet long, six inches wide and one inch thick, fastened upright and braced to the floor or ground. The top end of the board must not be more than one-eighth inch thick and the corners must be well rounded. Pull the strip backward and forward, flesh side down, exactly as a cloth is worked backward and forward in polishing shoes. Do this vigorously but do not cut holes in the hide. The strips must be staked very thoroughly all over in order to make them pliable and soft. The more time given to the staking, the more pliable the lace leather will be.

The staking must be done in a clean place where the strips will not get dirty.

After "staking" lay the strips flat on a large, low table or on smooth boards, grain side down, and go over the flesh side thoroughly with the back of the knife, or better, with a piece of wedge shaped hickory about six inches square and half an inch thick at the head of the wedge. The narrow end of the wedge should be from one thirty-second to one-sixteenth of an inch thick and should be very smooth. Work the flesh side of the hide with this "slicker," holding it in both hands by the top and pushing away from you, to remove all adhering flesh and dirt. Turn the strip over and work the grain side also.

Melt together three pounds of tallow and one pint of neatsfoot, cod or fish oil, or if none of these oils can be had, use a "medium" automobile cylinder oil instead. While the strips are still soft and uniformly damp (if they are not damp at this stage, cover them in damp sawdust until they are uniformly moist all over, but not wet) rub a heavy coat of the melted grease mixture all over both sides of each strip. This should be done in a very warm place and the grease should be as hot as the hand can bear without discomfort.

Roll the greased strips together and keep in a very warm place for two or three days. Unroll and again "stake" thoroughly. If too dry and stiff to stake readily, cover with damp sawdust until soft enough. After drying, if the leather is not sufficiently soft and pliable, again apply "dubbin" to both sides exactly as before, and lay away rolled for two days. Again "stake" and then work over both sides with the hickory "slicker" to more thoroughly work in the grease and remove the excess.

The strips should now be very supple and pliable even after they are thoroughly dried out. If they are not, they must be vigorously and thoroughly staked all over and redubbed with oil only, staked and "slicked," until they remain soft and pliable. Thorough, vigorous staking of the nearly dry leather is absolutely essential to produce the desired softness and pliability. When dry, soft and pliable, the leather is ready for use.

JUST SO

During a discussion with his wife touching things domestic, Grouche Leigh delivered himself of the following:

"Marie, I have observed that she who makes a good pudding in silence is of greater worth than she who makes a tart reply."—Wayside Tales.

NEMATODES

By R. R. Snowden

The root knot nematode is a field pest now receiving much attention on the part of agricultural scientists because of its rapid spread in various parts of the country and great damage done by it to many crops.

Last season the writer made an experiment on sugar beets near Compton with the result that the plots receiving nitrate of soda were free from nematodes while the others were affected with them.

In the latter part of June a beet field in Utah was visited that was so badly injured by nematodes that the superintendent remarked that he would not get a 25 per cent crop. The writer believed there would be no crop at all so badly blasted were the plants, but on the strength of the Compton experience a few of these beet plants were fertilized with nitrate of soda in about five different parts of the field, the individual plants being carefully marked.

In the latter part of September the writer had occasion again to visit this field. Upon careful examination the roots of the plants receiving nitrate of soda were found to be about twice as large as the neighboring ones that had received no nitrate.

In view of the importance of the situation it certainly would be well to follow up every promise of relief from this destructive pest.

HECKE AT CONFERENCE

George H. Hecke, director of state department of agriculture, recently returned from the Washington conference, considers it was an epoch making meeting. He says:

"It seems likely that the recent national conference at Washington will merely be the forerunner of similar conferences to be held each year in the future. It is felt that this is the significant feature of the national conference just closed in Washington, which, while important in itself, is especially so because it marks definite

policy on the part of the national administration to take the working farmers and fruit growers into its confidence in the establishment of its agricultural policies. Resolutions were passed and presented to congress for consideration on many matters of national importance and I feel that much good will result on account of these deliberations."

RECORD SHIPMENT OF CALIFORNIA ROSE BUSHES

The largest single shipment of rose bushes from California to the East has just been handled over Southern Pacific lines via New Orleans. Moving in four special cars, the shipment, weighing 129,360 pounds, from Montebello to Riverton, New Jersey, arrived at its destination in 12 days. To prevent damage to the bushes from low temperature while in transit, heaters were placed in the cars, which were accompanied by a shipper's representative.

SEED TESTING NOW AT SACRAMENTO

The state seed laboratory on the first of January was transferred from the state university at Berkeley to Sacramento, where it will be conducted under direction of the state department of agriculture. The laboratory will be under direction of W. S. Wilkinson, who was formerly with the state university. The primary purpose of the laboratory is to standardize agricultural seeds as to quality and see that they are properly labeled.

CAULIFLOWER SEASON BEGINS

With a shipment of 501 crates of cauliflower from the Ventura district to Seattle, the California season for this product has begun. Southern Pacific officials estimate that the 1922 crop will total approximately 1,900 cars as against 1,600 cars in 1921.

Pinches of sodium fluoride in the feathers will rid a hen of lice.

PINE FLAT FEASIBLE

Based on crop values, says the Fresno chamber of commerce, the Kings River is the most important irrigation stream in America, and the execution of the Pine Flat storage project will double its efficiency. This is, in brief, the finding of the special board of engineers which has been working for some months on the feasibility of one of the greatest irrigation schemes yet attempted.

The project is not only feasible but highly desirable, state the engineers. The estimated available water supply from the Kings River for the district is two million acre feet annually. The mean annual diversion by canal now is about 1,400,000, leaving an effective storage capacity in the reservoir of 600,000 acre feet.

Preliminary estimates place the cost of the scheme at \$20,000,000, including \$12,000,000 for the building of the Pine Flat dam and reservoir, \$5,000,000 for a power plant with a capacity of 90,000 kilowatts and \$3,000,000 for a large pumping plant.

The proposed dam at Pine Flat would be 320 feet high and would hold 620,000 acre feet of water. It is estimated that an income of \$720,000 could be made from the sale of surplus power above that required for pumping.

CLEAN GRAIN FOR SEED

There is no single farm operation so easily and cheaply done which gives larger returns than the thorough cleaning and grading of all seed sown. Besides cleaning out the weed seeds the light weight seeds are taken out when the job is properly done, thus preventing the reproduction of the poorer plants. This practice carried on year after year permits the increase of the best and kills out the poorest. Thorough cleaning and grading of all seeds planted is the first step toward a successful crop. There is no time like the present to put the seed in proper shape for planting.

Irrigation Type

Irrigation service calls for motors that will not falter even under the most trying conditions. U. S. Motors are designed particularly for irrigation duty. They are 40 degree motors, and will operate continuously in torrid temperatures, assuring reliable power at all times.

Western Made for Western Trade

These motors are a Pacific Coast product, designed by electrical engineers who know at first hand the peculiar conditions of each locality on the coast. Every purchaser is assured of quick factory service when required and our service department stands ready at all times to assist you. Prepare now for the coming irrigation season. Request literature.

POULTRY

Baby Chicks: When you buy baby chicks the big thing for you to remember is QUALITY, in both the chick itself and the parent stock. By investigating you will find that our chicks are in a class by themselves, for we have absolutely the best equipment obtainable to produce them and very high class stock from which we get our eggs, and then, too, we know how to handle and deliver chicks. We are hatching every week White Leghorns and Anconas that will lay; R. I. Reds and Barred Rocks that are well bred and will produce. Send for our circular and prices and order immediately for 1922 delivery. ORANGE COUNTY HATCHERY, Santa Ana, California.

Sly's Old Mission Strain Rhode Island Reds: Winners San Fernando first cock, first cockerel, second hen, third pen. VENTURA: First and second cock, first hen, first and third cockerel, first and second pullet, first and second pens. Two silver cups best male and best female in entire show. Hatching eggs from grand matings. Descriptive booklet free. Albert Sly, 1642 C. Middleton Place, Los Angeles.

We Are Now Booking Orders for S. C. White Leghorn Baby Chicks, from strong, healthy, vigorous stock. Bred especially for heavy egg production, from two hundred to two hundred and eighty egg strain. If you want strong, healthy baby chicks, place your orders with the Vineburg Hatchery. All baby chicks guaranteed safe delivery. Vineburg Hatchery, Vineburg, California.

Santa Cruz Chicks: Our Specials are White Leghorns, Buhrman's White Wyandottes and "Hill Crest" Reds, but also hatching choice Brown Leghorns, Anconas, Buff, White and Black Minorcas, Barred and White Rocks and Reds, Buff Orpingtons. Interesting folder ready. B. W. Archibald, Soquel, Santa Cruz County, California.

White Leghorns: Eggs for hatching our specialty, produced right, selected right, shipped right; 100 per cent fertility guaranteed. A laying strain of proven merit. Prices very reasonable. Send for folder, "Secret of Success." Curtis White Leghorn Ranch, R. 1, Box 29, Gardena, Cal.

February Chicks Pay Well—Ask for our Circular and Special Letter about them. White Leghorns, Brown Leghorns, \$15 hundred; R. I. Reds, Barred Rocks, Black Minorcas, \$18 hundred. Quality the best. Prompt service and reasonable prices. The Mission Hatchery, Box 17, Campbell, California.

Baby Chicks from the best 200 egg strain of White Leghorns in the valley. Please book your order early if you want chicks on a certain date. Established 10 years. Send for price list. Visitors welcome. The White Leghorn Hatchery, Pomona, California.

Union District Hatchery is now booking orders for the best thoroughbred baby chicks at the right price. White, Buff and Brown Leghorns, Rhode Island Reds, Black Minorcas, Anconas and Barred Plymouth Rocks. F. & L. Downing, Los Gatos.

Baby Chicks from Mature Heavy Laying Hens, White Leghorn from cockerels with trapnest record mothers, \$15.00 per 100. Barred Rock and Rhode Island Reds, \$20.00 per 100. One-third cash with order. Hawley's Hatchery and Poultry Farm, Route A, Box 315a, Lodi, California.

30 Acres Bearing Apple Orchard, 6-8 year old trees, 10 acres grain land, rich soil, good 6 room house, buildings on main road, near Coeur D'Alene, Idaho and noted lake resorts, boating, fishing, etc. \$8500 clear, will divide and trade part for improved chicken ranch. P. O. Box 242, Inglewood, California.

For Sale—Some of the Finest Orchard Land in Southern California, in a rapidly growing community, \$10.00 to \$50.00 per acre. Water available if desired. Call or address Adelanto Fruit Co., Adelanto, California.

For Sale: 40 acres No. 1 land, 2 miles from Caruthers; plenty of water, good water right, land clean. Price \$150 per acre, \$2,000 cash, balance to suit purchaser. Address G. W. McGowan, Route A, Box 330, Kingsburg, Cal.

For Sale: Ten acres, mile of Arcadia, Cal. Good improvements; income from walnuts, potatoes, alfalfa, poultry, last year \$3,000. \$16,000, terms. See owner on ranch. Jesse A. Moran, Arcadia, Cal. Route 1, Box 47, South 6th St.

Farmers, Attention—Literature, newspapers and price list of farm lands of Colusa County, the banner County of the great Sacramento Valley, free for postal card. F. B. Pryor, Colusa, California.

Ramona, San Diego County, California, where prices have not been boosted. Land \$50.00 to \$100.00. Health, fruits, vineyards, grain, dairy, stock, poultry, F. M. Dyke, Real Estate.

For Sale—Ranches, Homes, Acres, free list. Wilson Bros., Santa Cruz, California.

TURKEYS

Turkeys—Purebred Giant Bronze, male and female stock, sired by our two famous toms, "Goldbank Boy," champion Giant Bronze first prize winning cockerel at Madison Square Garden Show, New York, January, 1921, and "Copper King Jr.," a 36-lb. yearling son of "Copper King V.," the 38-lb. yearling that was grand champion at Madison Square Garden Show, January, 1919, both bred to choice 20-lb. hens. Eggs in season. Address Bronze King Farm, R. 2, Box 88A, Merced, California.

Giant Bronze Turkeys, Gold Nugget strain have continually proven their superiority by winning Gold Special Sweepstakes at the West's greatest shows for the past seven years. Why be satisfied with any but the best? Sold out of stock for this year; can book orders for few more setting eggs. Address Blackman & Mumford, 607 East Third St., Los Angeles, Cal.

Turkeys—Mammoth Bronze—About 30 young hens, nicely bred, \$7.00 up. A few good young toms, \$15.00 up. Eggs, 35c, 50c and \$1.00 each. Keys Ranch, El Monte.

Thoroughbred White Holland Turkey Toms, a few beauties at \$12.00. Three hens for \$20.00. Pause Pheasantry, Fair-oaks, California.

Mammoth Bronze Eggs, \$25 per 100. Prize winning birds, 100 hens. Lone Star Ranch, Lankershim, California.

Bourbon Red Turkeys, Buff Orpingtons. The Ferris Ranch, Reservoir Street, Pomona, California.

Veterinary

Answers in this column by Dr. Wm. Petrie, 2714 South Harvard Blvd., Los Angeles, are without charge. For immediate mail answer remit \$1.00. In writing questions give full symptoms or particulars of injury of animal.

Dyspepsia—Indigestion

I have a five year old horse that chews up his stall and also the corral and I have another horse six years old that overeats and gets indigestion when standing still on rainy days. What would you suggest doing for them?—Subscriber, Berendo.

This is probably the result of over-feeding, irregular feeding and giving water directly after feeding. There is no danger of a horse over-eating if the owner does not place the feed in his reach.

When working a horse should have about a pound of grain and a pound of hay every 24 hours for each one hundred pounds weight of the horse; that is, a horse weighing twelve hundred pounds should have twelve pounds of grain and twelve pounds of hay every 24 hours and days when he does not work the grain rations should be reduced about one-half or the noon feed of grain omitted. Horses that are loose built require a little more feed but not over one-fourth more. When the horse is not eating or working tie him with two straps; one from each side of the stall, so he can not reach anything to gnaw at, but tie him low enough so he can lay down. Never water a horse directly after eating.

Observe the following rules and you may expect good results: In the morning at least one and one-half hours before you expect to work him give him water to drink, then give him two pounds of hay and when that is half eaten give him four pounds of grain and go away and leave him for an hour. If it is a warm day water him in the middle of the forenoon and again just before the midday feeding and feed him the same as you did in the morning.

Do not forget to water him in the afternoon and soon after stopping work. Let him stand half an hour, then give him eight or ten pounds of hay and half an hour later give him his evening feed of grain. Go to the stable just before you retire and give him water again. Do not forget to tie him so he can not gnaw the sides of the stall and do not forget to omit the grain at noon on all days that he does not work. It will not be long before he will not want to gnaw the stall and you can turn him loose or tie him anywhere. You will probably think this is not enough feed but try it for three months and then let us know the results.

Hogs Ailing

I have a bunch of hogs that I am fattening. Four of them have rickets. They are healthy enough other ways. Will they be unfit for meat? What is a good remedy for them?—Subscriber, Ft. Bidwell.

Keep them in the sunshine as much as possible. Feed them some roots. Give them sour milk. Once a day give each one a tablespoon of phosphate of lime in the feed.

Breeding Young Heifers

At what age should heifers be bred? They are in fine condition and are now one year old.—Subscriber, Ramona.

If they are extra well developed they might be bred at fifteen months old. At any time between that and two years old is all right. Younger than that is apt to stunt the growth. At this day and age of crowding things to the limit you must be careful about the feeding and not have it too concentrated. Be sure they have enough rough feed so there is plenty for remasticating.

Udder Trouble.

Asking for information regarding a cow's udder. One quarter is hard but gives about as much milk as the other quarters. Has been so the greater part of a year. Have given her "Kow Kure" in the feed but it has no effect.

She will not eat salts in the feed. Am feeding bran and "Suremilk" beet pulp twice a day and all the alfalfa and oat hay that she can eat. She was tested by the state for tuberculosis about a year ago and again recently. The first time there was little or no reaction and the last time no reaction, still they put in the report "Suspicious."

What do you think of such a report and would you have her tested again by a private veterinarian? She is getting along in years but is a heavy milker and looks as well as she did six years ago.—Subscriber, Berkeley.

Sometimes a gland will take on a fleshy condition such as you describe and we can not account for it. Usually it involves the whole udder. Would advise rubbing that quarter

No extra charge. **GEORGE N. LEE CO., Dept. F-30** Omaha, Neb.

Brahmas for Meat

Are Brahmas a good breed for table use, that is, better than other heavy breeds?—Subscriber, Pasadena.

That depends on just exactly what you want. Both Light and Dark Brahmas make wonderful roasters, quite equal to the turkey their admirers believe, but they grow too slowly to make profitable broilers or fryers. Rocks, Wyandottes or Rhode Island Reds make better, more quickly grown fryers, and for an all around table fowl, broiler, fryer or roaster, the Orpington is unexcelled in my opinion. If you are planning to raise market poultry why not try two breeds, Light Brahmas for roasters and White Wyandottes for fryers? A cross of these two is said to make a particularly fine table bird.

Melilotus for Greens

When no other green feed is available would it be advisable to feed melilotus to chickens?—Subscriber, Downey.

Melilotus is excellent green feed. I do not know why it is not more generally used for a forage plant. Any green that they will eat is good for chickens. Malva and other weeds may be utilized when the regular supply gives out.

Narraganset Turkeys

Do you know where there are any very gray turkeys, called by some Silver Bronze and by others Narragansets? There are none advertised in the Cultivator.—Subscriber, Woodland.

This breed appears occasionally at shows, but I have not now the name of any breeder. If any reader knows where such stock is to be found we shall be glad to hear of it.

Blackhead Preventive

I would like to know the ingredients of the mash mentioned in issue of January 7, which is used by a Vacaville subscriber for preventing blackhead.—Subscriber, San Fernando.

To a pint of bran and a pint of bread crumbs add enough boiling water to make a crumbly mash. Let this cool till it is only slightly warm and add 1 quart chopped greens, 1 small chopped onion or onion tops and 1 cup chick grit or sand. For each 10 turkeys add 3 drops turpentine and ¼ teaspoon ginger. This is fed twice a week in place of the regular mash and twice a day for 3 days if white spots are noticed on the back of the legs. The regular mash, which is fed in the morning till the poulters are 3 months old, consists of 1 medium-sized onion chopped fine and added to 1 quart chopped green, 1 pint bran and 1 pint hulled barley or oats.

Drooping Wing

What is the cause of one of my pullets drooping one wing and always trying to step over it? Is there a remedy?—Subscriber, Los Angeles.

There must have been some injury. Possibly a bone has been broken and has healed without being set. If you think the pullet is worth the trouble you might break the bone again, set it and wrap in a bandage made stiff with starch. When this has dried it makes a sort of cast which will hold the bone in place till it has healed.

Mysterious Growth

One of my healthy, laying pullets has a growth nearly as large as a small egg just below the vent. It feels hard and seems to be attached to the skin.—Subscriber, Exeter.

The cause of such growths, which are seen occasionally on apparently healthy hens, is not understood. You may possibly be able to scatter it by painting with iodine daily for a week or so. If this treatment is not successful, kill the hen.

Bloody Yolk

One of my hens frequently lays a double yolked egg. One of these was found to contain one good yolk, the

other being blood and water. What caused the condition?—Subscriber, Lincoln.

Bloody yolks are believed to be due to a rupture in the ovarian follicle. When this ruptures a little blood escapes into the oviduct and is caught up in the albumen. Many hens lay eggs containing blood spots in the spring when laying is heavy. In the case cited the rupture was unusually large and may indicate that the flock is being pushed a little too hard for eggs. More greens and a bulkier mash are the remedy.

Roupy Hen

One of my hens has at times a frothy or bubbly discharge from the corner of her eye. What is the cause?—Subscriber, Bakersfield.

She is rousy. You can probably cure the attack temporarily by washing the eye with a boracic acid solution or dipping her head in the potassium permanganate solution which has been so often recommended in this column, but if the attacks are persistent it would be better to kill her. She is not fit for a breeder and is not likely to be a steady layer.

Soft Roasters

What age or weight can a Leghorn, Rock or R.I. Red chicken be and grade as a soft roaster?—Subscriber, Hesperia.

A Leghorn male is never fit for a soft roaster. By the time it is big enough the meat is tough. I do not know whether Leghorn pullets are ever sold as roasters. If they are large enough they might answer the other requirements. Pullets of the heavy breeds make fine roasters up to six or eight months of age. Cockerels of these breeds grade as soft roasters at from four to six pounds in weight, and four to five months in age. By the time they are six months old their spurs are grown and their flesh has toughened. Light Brahma cockerels remain soft longer than Reds and Rocks.

The Best Brooder

What is the best way to raise baby chicks without hens? We have a house 6 by 8 with concrete floor in which we wish to raise 200 chicks. Last year we bought 100 chicks and gave them to four hens, but they did not do well. Now we would like to try either a brooder or brooder stove or electric hover. We live in an orange grove and are making a success with the oranges as well as with Jersey cows and Rhode Island Red chickens on the side.—Subscriber, Riverside.

With the special rate at which Riverside poultrymen are able to secure electricity for incubating and brooding there ought to be little question as to which is the best brooder for you. Get an electric hover and brood the 200 chicks in your 6 by 8 house. You will need a sheltered run on the south side of the house, and it would be better if you could enclose a small space outside for a playroom since the house is so small. I am afraid you did not give your hens a fair chance. If you had used six hens instead of four for the 100 chicks and given each one a coop and run by herself you could have raised at least as many of the chicks as you will raise with any kind of artificial heat.

Canopy Hovers

Are the oil burning canopy hovers as good for raising chicks as the old type hot water or hot air brooders?—Subscriber, Camino.

The question is one of size of flock rather than of method of providing heat. Do chicks do better in flocks of 100 or 500 or 1200? As a rule the smaller the flock the smaller is the mortality among baby chicks, but large commercial poultrymen believe the lessening of labor by the use of the large hovers offset the greater mortality.

America's Most Useful Implement

THE NEW, PERFECTED

Stauder Mak-A-Tractor

Clamped to an Ordinary Automobile
Anybody Can Attach and Operate It

MILLIONS of dollars worth of these machines have been in successful use for years on thousands of farms, doing regular farm work—plowing, dragging, discing, mowing, reaping, cultivating orchards, etc. Also used successfully by road builders for pulling road drags, gravel wagons, graders, etc. Used by many golf clubs and city parks for pulling mowers cutting 12-foot swath, hauling dirt, ditching, etc. Converts any used auto into a profit-earning machine. Cheapest power on earth. Has more uses than any other tractor. Won all important events at Famous International Tractor Trials. Every farmer or trucker needs this simple machine. Does the average work of from three to six horses, depending on size and condition of auto.

Write for Special 6 Months' Trial Offer

DON'T BUY NOW. TRY IT FIRST. Among the many machines sold last year, we put out 100 machines under this extraordinary offer, and after six months' actual use on his own work, every user bought the trial machine and paid us in full, proving complete satisfaction. To prove our confidence in this machine, we are going to extend this wonderful offer to 2000 users this year. All we ask is that you apply the Golden Rule: Pay us for this machine after six months' actual use, if you like it, or send it back, and owe us nothing. You are the only Judge.

really deformed there might be a similar deformity in the offspring. As you are not certain just what the trouble is, why not try incubating some of the eggs before you discard the birds? If the eggs are fertile and the poult strong and perfect there is nothing to worry about. If the poults prove to be abnormal in any way you will have to change toms.

Reds for Exhibition

Will you please give me directions for selecting my best R. I. Reds, pullets and cockerels, for exhibition? How can I tell them up to make them appear their best? Should the pullets be laying?—Subscriber, Delano.

Standard weights for R. I. Reds are 8½ lbs. for cocks, 7½ lbs. for cockerels, 6½ lbs. for hens and 5 lbs. for pullets. Color should be a brilliant red, with black in wings and tail and under color red to the skin. Back of male should be broad, long and carried horizontally, head blocky, comb perfectly straight and upright, with five even points and smooth blade. Pullet's tail should be carried at an angle of 35 degrees above horizontal, head medium size and carried horizontally. Colored birds are not usually washed. Feet and shanks should be scrubbed and anointed with vasoline to bring out the bright yellow color.

Raw Beef Bones

I feed my 128 hens a laying mash, barley and corn. Would I get a larger egg yield by grinding raw beef bones and giving to them, and how much should I feed?—Subscriber, Arroyo Grande.

The beef bones, "green cut bone" we call them, ought to help production—just how much they will help depends on the quantity of meat on them. A pound to every 20 hens twice a week is as much as it is wise to feed, and be sure they are fresh. Stale meat does more harm than good. If your egg yield is not satisfactory you might try adding wheat to the grain ration, making it equal parts wheat, barley and corn. Do not feed more than a quart a day to 15 or 16 hens, and see to it that they have some kind of green feed every day.

Mating Turkeys

How many turkey hens should be mated to one tom? Where can I get a book on turkeys?—Subscriber, Lankershim.

Most breeders run one tom with nine or ten turkeys. Some, to make fertility more certain, keep two toms for each pen, putting them with the hens on alternate days. If a number of breeding pens are kept two or three extra toms might suffice for all. There is a government bulletin which may be had free from the department of agriculture, Washington, D. C. It contains a good many useful suggestions.

Worms

How can I rid my White Leghorn hens of intestinal worms?—Subscriber, Lankershim.

Try the tobacco treatment recommended by Dr. Beach of the poultry division of the state college of agriculture. Mix one pound tobacco dust or powder with 50 pounds dry mash and keep before the hens about three weeks. This treatment may be repeated at intervals of three weeks until all signs of worms have disappeared. Oil of turpentine is also a standard remedy for worms, but it must be given after a fast and followed by a dose of salts or castor oil. The tobacco treatment is far simpler when an entire flock is affected.

ACCREDITED HATCHERIES

The Sonoma County farm bureau poultry department is taking an advanced step in securing pedigreed or at least higher producing poultry. The selling of day old chicks is an exceptionally large business in that county and while the production quality of their poultry is advancing this effort should materially speed up the advancement. The following conditions are set forth under which hatcheries may operate and secure place on the accredited list.

Fowls used for breeders shall be in

good healthy condition as judged by the inspector, and shall be culled so far as may be practicable during the first period beginning November 1, 1921, and shall be culled thoroughly during the early summers of 1922 and 1923, according to the standards recommended and demonstrated by the agricultural extension service.

Females are to be at least 12 months old.

Males are to be approved by the inspector as to vigor, and shall not be less than eight months of age. The males to be used during the breeding season of 1922-23, beginning November 1, 1922, shall have, in addition, trapnest pedigree records on the side of the sire of 175 eggs, or better, and the males to be used during the breeding season of 1923-24, shall have a trapnest pedigree record of both the dam and sire of 175 eggs.

No artificial lighting earlier than 5:00 a.m. or stimulating feeds to produce higher than 40 per cent during the months of December and January.

Eggs to be delivered within seven days, and precautions taken to prevent chilling or overheating.

Weight to be 22 to 26 ounces per dozen.

Eggs must be uniform in size, shape, color and shell texture.

Ample supply of greens must be fed birds in inspected pens.

Grain must constitute at least 50 per cent of total amount of grain and mash fed, and where fed in houses, litter must be reasonably clean, dry and loose.

The poultry department has given out a list of hatcheries which were accredited for the month of January. This list will be entirely revised for February.

CALIFORNIA FARM BUREAU EGG LAYING CONTEST AT SANTA CRUZ

High pens for the ten days from January 10 to 21; R. H. Young Santa Cruz, 76 eggs; Alex Stewart, Santa Cruz, 76; Boling's Poultry Farm, Gilroy, 75; Warren Wood, Santa Cruz, 71; H. C. Kleinsmith, Hoff, Oregon, 69; Geo. B. Ferris, Grand Rapids, Michigan, 67; J. J. Shore, Santa Cruz, 66; Kinmont Poultry Farm, Seattle, Washington, 65; D. C. Berry, Santa Cruz, 65; Geo. Wood, Santa Cruz, 62; Geo. Wood, 61; C. H. Russell, Santa Cruz, 60; C. P. Brooks, Santa Cruz, 60; Lot Durgan, Watsonville, 60; W. H. Marshall, Santa Cruz, 60; Sunrise Poultry Farm, Santa Cruz, 59; W. J. Neef, Santa Cruz, 57; Levi Mellon, Santa Cruz, 55; Geo. Barker, Santa Cruz, 55; E. D. Crewdson, Santa Cruz, 54; H. H. Corbett, Santa Cruz, 54.

Pens constitute the lay of ten hens. All of the above are White Leghorns except H. C. Kleinsmith's pen which is Barred Rocks.—Max Kortum, Manager.

STORRS EGG LAYING CONTEST

Storrs, Connecticut, January 31, 1922.—Report for the thirteenth week ending January 30:

In the thirteenth week of the contest the 100 pens produced 2640 eggs or a yield of nearly 33 per cent. This is only three eggs more than last week but 353 eggs more than last year for the same period and 229 more than the seven year average. Not only this but the birds have produced more eggs for the thirteenth week this year than in the same period in any of the seven previous contests.

Apparently the Leghorns have become tired of having the American breeds take first honors for the week for we find a pen of White Leghorns owned by Andrew L. Ohr, Wallingford, Connecticut, in first place for the week with a production of 47 eggs.

The four leading pens in each of the principal breeds are as follows:

Plymouth Rocks

Seven Hills Farm (Barred), 409 eggs; S. Bradford Allyn (White), 403; Harry C. Culver (Barred), 362; Merritt M. Clark (Barred), 313.

White Wyandottes

Frank P. Matteson, 529; Woodbridge Orchards, 481; Clemens J. Die-mand, 434; Walter Bradbury, 422.

Rhode Island Reds

The Orchards, 446; Applecrest (Continued on Page 199.)

STAWBERRY PLANTS

That Please the California Fruit Grower. G. J. Streicher, Napa Co. Cal., writes: Jan. 7-22. Received strawberry plants today in fine shape, they are nice clean, well rooted stock. The inspector said they were the best rooted plants he had ever seen.

Tangerines: Demand and movement light, market dull; mostly 6; poorer, 5 lb.

HAY

Alfalfa Growers of California report: The storms of last week, general over the entire state after only a short spell of dry weather, again interfered with the country movement of alfalfa hay and kept down receipts.

Free consumption and low stocks in the hands of users resulted in a continued strong and steady demand for current use; the demand for the higher grades of hay could only be partly supplied and it looks as if this would continue to be the case during the balance of the old crop year. The market and prices remained correspondingly firm.

There were 1,550 tons of grain and alfalfa hay received on the Los Angeles tracks the week ending February 11th, with 450 tons held over.

Prevailing prices last week, delivered in the vicinity of Los Angeles:

No. 1 dairy alfalfa.....25.00

Standard.....20.00

Quotations by Nichols-Loomis Company. Following are prices to growers f. o. b. Los Angeles in carload lots; handling and commission must be added to obtain retail prices on new hay:

Tame Oats.....22.00@28.00

Barley.....18.00@24.00

Alfalfa, Rabbit.....24.00@28.00

Alfalfa, No. 1 Dairy.....20.00@22.00

Standard.....16.00@18.00

Straw.....10.00

quality, 6@6½; cows and helpers, No. 1, 5@5½; second quality, 4½@5; bulls and stags, 3½@4.

Calves: Light weight, 8@9; heavy, 6½@7½.

Sheep: Wethers, 6½@7; ewes, 3½@4.

Lambs: 9½@10½.

Hogs: Hard, fat, grain-fed, weighing 125 to 200 lbs., 11 lb.; do, 200 to 250 lbs., 10 lb.; do, 250 to 300 lbs., 9 lb.; light sows, 9 lb.; heavy, 8 lb.
